A four state dynamical model of reentry vehicle motion was used in a weighted least squares batch estimation algorithm to determine the angular motion and aerodynamic coefficients for a trajectory of known velocity, dynamic pressure, and roll rate. A model was proposed for the time variation of the aerodynamic coefficients. Simulated accelerometer and gyro measurements were processed to estimate the unknown states and coefficients. A second order measurement model was developed to account for the dynamic response characteristics of onboard measurement sensors in the presence of reentry vehicle oscillatory behavior. Examples are provided which illustrate the feasibility of the four state dynamical model and second order measurement model in reentry vehicle estimation problems.

EARTH ORBITAL EXPERIMENT PROGRAM AND REQUIREMENTS STUDY Summary Report, 2 Sep. 1969 - 9 Apr. 1971
Apr. 1971. 112 p.
(Contract NAS1-9464)
(NASA-CR-162132; MDC-G0788) Avail: NTIS

HC A06/MF A01 CSCL 22A

A compilation of Earth orbital experiments and their required support technological developments is given. Six disciplines including manned spaceflight capability, space biology, spce astronomy, space physics, communications and navigation, and Earth observations were subjected to an overview analysis that resulted in the identifying of 3,800 critical issues. Of these critical issues, 1,983 that were deemed suitable for near-term manned space research were grouped into 136 research clusters in accordance with commonality of instrumentation and measurements. These clusters are described at a level of detail that identifies the important aspects of the research and establishes the principal requirements that will be placed on the missions in accomplishing the research and on the space research facilities for these missions. Summaries of the space facility requirements and guidelines for mission planning are given. The supporting technology developments required to pursue the research are identified and grouped into 233 work packages. M.G.

GENERAL PERTURBATIONS THEORIES DERIVED FROM THE 1965 LANE DRAG THEORY

Max H. Lane and Felix R. Hoots Dec. 1979 64 p refs
(AD-A081264; ASTRODYNAMIC-2) Avail: NTIS
HC A04/MF A01 CSCL 22/3

The Air Force General Perturbation theory (AFGP4) based on the analytic satellite theory of Lane (1965) and Lane and Cranford (1969) which models the gravitational zonal harmonics through J5 and models the atmosphere with a spherically symmetric power density function is given here in its complete form. All equations needed for satellite prediction are given and the reader is referred to the original publications for theoretical background. Two simplified equation subsets (IGP4 and SGP4) of AFGP4 are also given and the procedure by which they were obtained is outlined. GRA

ELECTROSTATIC PROTECTION OF THE SOLAR POWER SATELLITE AND RECTENNA

John W. Freeman, Arthur A. Few, Jr., Patricia H. Reiff, David Cooke, Jerry Bohannon, and Bob Haymes May 1979 157 p
(Contract NAS8-33023)
(NASA-CR-161438) Avail: NTIS HC A08/MF A01 CSCL 22B

Several features of the interactions of the solar power satellite (SPS) with its space environment were examined theoretically. The voltages produced at various surfaces due to space plasmas and the plasma leakage currents through the kapton and sapphire solar cell blankets were calculated. At geosynchronous orbit, this parasitic power loss is only 0.7%, and is easily compensated by oversizing. At low-Earth orbit, the power loss is potentially much larger (3%), and anomalous arcing is expected for the EOTV high voltage negative surfaces. Preliminary results of a three dimensional self-consistent plasma and electric field computer program are presented, confirming the validity of the predictions made from the one dimensional models. Magnetic shielding of the satellite, to reduce the power drain and to protect the solar cells from energetic electron and plasma ion bombardment is considered. It is concluded that minor modifications can allow the SPS to operate safely and efficiently in its space environment. The SPS design employed in this study is the 1978 MSFC baseline design utilizing GaAs solar cells at CR-2 and an aluminum structure. A.R.H.

COSMOS. METEOSAT: METEOROLOGICAL DATA DISTRIBUTION (MDD) ON METEOSAT Final Report [COSMOS. METEOSAT: MDD SUR METEOSAT]
R. Verdin 25 Jun. 1979 202 p refs In FRENCH
(Contract ESA-3828/79-F-CG(SC))
(Rept-2786/85-TEA; ESA-CR(P)-1283) Avail: NTIS HC A10/MF A01

The possibility of implementing meteorological data distribution (MDD) on a future Meteosat was examined. Three options were studied, a linear repeater, a regenerative repeater with separate power amplifier, and a regenerative repeater using the power amplifier of the Meteosat. Reasons for the choice of the second are elaborated. Methods for increasing the output of the solar generator on Meteosat and the power of the S band amplifier are reviewed. A study of the MDD regenerative transmitter is presented, along with a discussion of perturbations caused by a mechanically despun antenna on Meteosat. An evaluation was made of the electronic despun antenna in Rx mode relative to the performance of the Meteosat EDA. Author (ESA)

DETERMINATION OF BOUNDARIES FOR KINEMATIC INTERCEPT REGIONS AND EVALUATION OF THE MISS DISTANCE FOR LINE-OF-SIGHT (LOS)-GUIDED MISSILES
Winfried Hofmann Mar. 1979 79 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-626)
(DFVLR-FB-79-13) Avail: NTIS HC A05/MF A01; DFVLR, Cologne DM 15,40

The kinematic and dynamic behavior of a guided missile is calculated in terms relating to initial and feedback correction. Requirements on the angle between visual sight line and trajectory as well as on the lateral acceleration of the missile are deduced from the kinematics of motion. The boundaries of kinematic intercept regions are presented. A linearized time dependent dynamic deviation model is used to evaluate the miss distance in terms of missile dynamics and initial errors. A STUDY OF INCREASED RELIABILITY AND LIFETIMES FOR FUTURE COMMUNICATIONS SATELLITES, VOLUME 1 Summary Report
G. E. Hall, comp. and A. I. Naylor, comp. Oct. 1979 23 p 2 Vol.
(Contract ESA-3925/79-NL-AB(SC))
(GTS-790174-Vol-1; ESA-CR(P)-1291-Vol-1) Avail: NTIS HC A02/MF A01

An analysis of the orbital life performance of 150 communications satellites was undertaken and supplemented by a literature search, an independent investigation of life limiting spacecraft elements, and visits to North American and European organizations, with the aim of improving cost effectiveness and service availability of communications satellites by extending design lifetimes to 10-15 years. It is shown that 20% of satellites failed to achieve full operational status in orbit. Satellites display a nonconstant failure rate consistent with extensive redundancy. Production expertise has matched the steady increase in design lifetimes which are, on an average, attained. A nine to ten year life is the present state of the art. Major satellites life limiters are: NiCd batteries (problems unsolved); TWTAs, radiation degradation, microwave transistors, inadequate parts screening, fuel depletion (requiring individual trade off decisions); design faults, command disabling, poor reduncancy, repeater electronics, power distribution, motors/bearings, bladders, thrusters, thermal cycle stresses, static discharging, microprocessor applications (requiring design/production control and further research).

SPACE TRANSPORTATION SYSTEM WESTERN LAUNCH SITE CONSTRUCTION MANAGEMENT INFORMATION SYSTEM: A CASE STUDY M.S. Thesis
G. Scott Griffin and James M. Mardis Sep. 1979 97 p refs
(AD-A077675; AFIT-LSSR-4-79B) Avail: NTIS HC A05/MF A01

The Corps of Engineers Management Information System (COEMIS) is used by the Corps of Engineers in their role as construction agents on Air Force projects built under the Military Construction Program. This research investigates the ability of COEMIS to meet Air Force informational needs by examining the construction management effort in progress on the Western Launch Site Space Transportation System Facilities at Vandenberg Air Force Base, California. The research concluded that the Corps of Engineers Management Information System can be an effective, efficient management tool which has the capability to meet Air Force needs provided: (1) implementation of real time computer interfaces, (2) Air Force participation in COEMIS, and (3) establishment of a split data base. The results of this study should be applicable to all major Air Force construction projects managed by the Army Corps of Engineers. GRA

J. B. Saulnier (Ecole Natl. Super. de Mecan. et d'Aerotech.), A. Alexandre (Ecole Natl. Super. de Mecan. et d'Aerotech.), and J. Martinet (Ecole Natl. Super. de Mecan. et d'Aerotech.) Oct. 1979 39 p refs In FRENCH
(ESA-STM-214; ISSN-0379-4075) Avail: NTIS HC A03/MF A01

A model of coupled heat transfer by radiation and forced convection was developed and applied to the Spacelab short module. The fundamental laws concerning emission and absorption of radiation in gases and gaseous mixtures are discussed. The Spacelab cabin was modelled using a cylindrical pipe in which a mixture of air, carbon dioxide, and water vapor flows at uniform velocity. The influence of zoning is demonstrated and the equations of combined heat transfer are solved for a step change in the input fluid temperature. Author (ESA)

CHEMICAL PHYSICS OF CHARGE MECHANISMS IN NONMETALLIC SPACECRAFT MATERIALS Final Report
Richard C. Adamo and Joseph E. Nanevicz May 1979 37 p refs
(Contract F49620-77-C-0113; AF Proj. 2303; SRI Proj. 6402)
(AD-A081487; AFOSR-80-0125TR) Avail: NTIS HC A03/MF A01 CSCL 22/2

The interactions of spacecraft and space systems with the changing solar illumination and charged-particle environments in the vacuum of space result in the occurrence of a number of electrostatic and electromagnetic phenomena. These phenomena, commonly referred to collectively as spacecraft charging effects, can produce undesirable and sometimes serious problems with the performance and operation of military, commercial and NASA spacecraft. This report explores the behavior of typical polymeric spacecraft surface materials under simulated orbital conditions to provide a better understanding of the electrostatic and electromagnetic charging and discharging processes associated with spacecraft charging phenomena. The results of the materials charging behavior studies provide an empirical measure of some of the complexities of materials behavior under dynamic conditions more typical of those encountered in space than are normally used in ground based simulations and indicate that many present laboratory simulation and measurement techniques may not provide data truly representative of actual in-orbit spacecraft charging effects. The results of the discharge characterization experiments indicate that electromagnetic transients caused by sample discharges produced signals in external sensors indicative of transient electric field changes of tens of kV/m at locations several inches from the sample boundaries. These transient electromagnetic signals can therefore be considered as extremely energetic sources of possible electromagnetic interference on spacecraft. GRA

A ROCKET-BORNE ENERGY SPECTROMETER USING MULTIPLE SOLID-STATE DETECTORS FOR PARTICLE IDENTIFICATION
K. L. Fries, L. G. Smith, and H. D. Voss 1 Dec. 1979 167 p refs

(Grant NGR-14-005-181)
(NASA-CR-153183; UILU-ENG-79-2510; Aeronomy-91;
ISSN-0568-0581) Avail: NTIS HC A08/MF A01 CSCL 14B

A rocket-borne experiment using energy spectrometers that allows particle identification by the use of multiple solid-state detectors is described. The instrumentation provides information regarding the energy spectrum, pitch-angle distribution, and the type of energetic particles present in the ionosphere. Particle identification was accomplished by considering detector loss mechanisms and their effects on various types of particles. Solid state detectors with gold and aluminum surfaces of several thicknesses were used. The ratios of measured energies for the various detectors were compared against known relationships during ground-based analysis. Pitch-angle information was obtained by using detectors with small geometrical factors mounted with several look angles. Particle flux was recorded as a function of rocket azimuth angle. By considering the rocket azimuth, the rocket precession, and the location of the detectors on the rocket, the pitched angle of the incident particles was derived. R.E.S.

COOLING OF HIGH PRESSURE ROCKET THRUST CHAMBERS WITH LIQUID OXYGEN
H. G. Price 1980 15 p refs Proposed for presentation at the 16th Joint Propulsion Conf., Hartford, 30 Jun. - 2 Jul. 1980; cosponsored by AIAA, ASME and SAE
(NASA-TM-81503; E-441) Avail: NTIS HC A02/MF A01 CSCL 21H

An experimental program using hydrogen and oxygen as the propellants and supercritical liquid oxygen (LOX) as the coolant was conducted at 4.14 and 8.274 MN/square meters (600 and 1200 psia) chamber pressure. Data on the following are presented: the effect of LOX leaking into the combustion region through small cracks in the chamber wall; and verification of the supercritical oxygen heat transfer correlation developed from heated tube experiments. A total of four thrust chambers with throat diameters of 0.066 m were tested. Of these, three were cyclically tested to 4.14 MN/square meters (600 psia) chamber pressure until a crack developed. One had 23 additional hot cycles accumulated with no apparent metal burning or distress. The fourth chamber was operated at 8.274 MN/square meters (1200 psia) pressure to obtain steady state heat transfer data. Wall temperature measurements confirmed the heat transfer correlation. SURVEILLANCE REPORT. STAGE 1, DISSECTED MOTORS, PHASE 11: PROPELLANT COMPONENT TESTING Semiannual Report
John A. Thompson Nov. 1979 96 p
(AD-A081535; MANCP-427(79)) Avail: NTIS HC A05/MF A01 CSCL 21/9

Testing was performed to determine the useful shelf/service life for LGM-30 Stage 1 Rocket Motors. A three year storage program for propellant and components was started in May 1961. This program was then extended to a ten year study and later continued indefinitely to assure that a deterioration in motor physical characteristics could be detected in time to take some corrective actions before the weapon system performance deteriorated below an acceptable level. This report covers only propellant data and limited case bond data. The malfunction of an environmental chamber destroyed component samples that had originally been part of this testing program (and the inadvertent burning of some motors during dissection reduced the material available for testing). Planned dissection of selected motors in the future will provide samples for continued component testing. The data from this test period was combined with data from previous testing and entered into the G085 computer for storage, analysis, and regression analysis. From the statistical analysis of all data tested to date, significant degradation of the propellant does not appear likely for at least two years past the oldest data point. GRA

DEVELOPMENT OF A MICROPROCESSOR-BASED INSTRUMENT FOR STATIC TESTING SMALL ROCKET ENGINES M.S. Thesis
Arthur Houghton Barber, III Sep. 1979 105 p refs
(AD-A081083) Avail: NTIS HC A06/MF A01 CSCL 14/2

A microprocessor-based instrument was developed for static testing solid-fuel rocket engines having peak thrusts of 130 Newtons or less and total impulses of up to 100 Newton-seconds. It measured peak thrust, total impulse, burn time, pyrotechnic delay time, and maximum casing external temperature, all to relative accuracies of two percent of the smallest expected values. This corresponds to better than 0.1 percent of full scale. The instrument was designed for minimum parts cost and for portable operation from two twelve-volt batteries. It may be easily modified to test engines with five to ten times greater thrusts and total impulses. GRA

ROOM TEMPERATURE CURING RESIN SYSTEMS FOR GRAPHITE/EPOXY COMPOSITE REPAIR Final Report, Jan. - Dec. 1979
D. J. Crabtree Dec. 1979 83 p
(Contract N62269-79-C-0224)
(AD-A081738; NOR-80-46; NADC-78101-60) Avail: NTIS HC A05/MF A01 CSCL 11/4

Adhesive formulations were developed for the repair of damaged graphite/epoxy structures on board ship. These adhesives cure at 24 C (75 F) or in the moderate temperature range of 67 to 121 C (150 to 250 F). The formulations which gave the best results in lap shear testing were formulated from high molecular weight and high functionality epoxy resins and a polyamine curing agent. A typical formulation is composed of a cresol novalac epoxy, (Ciba-Geigy ECN 1299), the triglycidyl ether of p-aminophenol, (Ciba-Geigy 0510), and diethylenetriamine, a polyamine curing agent. After a 72 hour cure at 24 C (75 F) an adhesive compounded from this formulation had much higher lap shear strength at 121 C (250 F) than did commercially available epoxy, acrylic, and anaerobic adhesives. Aluminum/aluminum bonds tested in a rapid heat-up to 121 C (250 F) (at 150 F/min) and immediate application of load at 121 C (250 F) had lap shear strength of 1400 psi whereas the commercial adhesives had 500-700 psi strength in the same test. The formulation when cured at 121 C (250 F) had lap shear strength at 121 C (250 F) of 2700 psi. Another promising system is the vinyl ester resin system as a moderate temperature, 66 C to 121 C (150 F to 250 F), curing adhesive. It has good environmental durability and methodological research. This investigation concentrates on the damage produced in chemically vapor deposited (CVD) zinc sulfide (ZnS) by water drop impacts on the order of 1 mm in diameter impinging over a velocity range from 222 to 684/ms (730 to 2240 fps). A combined experimental and analytical approach was pursued to determine the relationships between water drop impact damage and the material properties of CVD ZnS in order to evaluate and guide efforts to develop erosion resistant window materials for use at 8-12 micrometer wavelengths. Microscopic observations of the damage produced in three formulations of CVD ZnS representing variations in grain size, grain shape, and inclusion content indicated the fracture trajectories and penetration depths were essentially insensitive to the range of microstructural features which were investigated. The quality of the surface finish was found to be the dominant contribution to the fracture response of CVD ZnS. Further modification of the bulk material properties does not appear warranted; the present production material is satisfactory. Considerably greater latitude for increased resistance to rain erosion can be gained from improved polishing procedures and subsequent maintenance of the initial surface finish. GRA

HIGH-TEMPERATURE MECHANICAL PROPERTIES OF SINTERED ALPHA SILICON CARBIDE (13 OCTOBER 1978 - 13 OCTOBER 1979)
David M. Kotchick 19 Feb. 1980 94 p refs
(Contract N00014-76-C-0249)
(AD-A081824; AiResearch-80-16772) Avail: NTIS HC A05/MF A01 CSCL 07/1

Failures on tensile-stressed, as-fired samples were caused primarily by processing defects and did not appear to be associated with compositional changes (amount of sintering agent) in the material. At high testing temperatures (above 1340 C), the occurrence of processing defects appears to control strength, making it impossible to speculate on the effect of salt and oxidation during slow crack growth in these specimens. Over the variety of conditions tested such as salt, oxidation, and their combinations, strength did not vary greatly. Therefore, the defects from processing represents the reasonable lower limit of strength under the imposed testing conditions. The determined strength values probably represent reasonable design data for components with as-fired, as-formed surfaces of similarly processed SASC. Since these strength values represent a reasonable lower limit for as-fired, as-formed surfaces of SASC, the potential is good for improvement by processing improvements to eliminate defects. SASC continues to show promise as a viable engineering material. It will become more attractive for heat exchanger applications in aggressive environments as processing becomes more sophisticated. DEFINITION AND MODELING OF CRITICAL FLAWS IN GRAPHITE FIBER REINFORCED RESIN MATRIX COMPOSITE MATERIALS Final Report, 28 Jul. 1978 - 28 Aug. 1979
S. N. Chatterjee, Z. Hashin, and R. B. Pipes 28 Aug. 1979 121 p refs
(Contract N62269-78-C-0111)
(AD-A080893: MSC/TFR/1105/1008) Avail: NTIS HC A06/MF A01 CSCL 11/4

An analytical and experimental study was conducted to determine criticality of interlaminar disbonds by NDE methods. Criticality of such flaws in a shear environment (action of shear near support) was defined in terms of crack propagation and was analyzed by principles and methods of fracture mechanics. Growth of disbonds under cylic loading was also studied. Failure under compressive loading in presence of a disbond was defined in terms of buckling and an elastic stability analysis was utilized for assessing criticality. Analytical predictions were compared with experimental results in both cases. Utrasonic 'C' scans were used for detection and tracking of the flaws. Preliminary wave propagation studies were conducted for estimating changes in storage and loss moduli induced by moisture conditioning to examine the possibility of using such measurements as NDT techniques for damage assessment. The following four problems have been analyzed in detail. First, the effective heat removal rate for a conducting material perforated with many small holes is computed. Second, for a conducting material impregnated with nonconductors occupying a large fraction of the medium and randomly dispersed the effective conductivity is obtained. Third, for a material with a random rough boundary, a theory of effective boundary impedance has been developed. Fourth, the effects of random structural imperfections on buckling loads of beams have been computed. GRA

PROGRAM TO STUDY SIC FIBER REINFORCED GLASS MATRIX COMPOSITES Annual Report, Jul. 1978 - Jul. 1979
J. J. Brennan Aug. 1979 36 p refs
(Contract N00014-78-C-0503; NR Proj. 032-589)
(AD-A077638; UTRC/R79-914401-2) Avail: NTIS HC A03/MF A01 CSCL 11/4

Glass-ceramic composites reinforced with SiC fibers have been fabricated that exhibit good strength properties from RT to 1000 C. In particular, a lithium-aluminum-silicate (LAS) matrix reinforced with SiC yarn has been shown to possess bend strengths of over 690 MPa (100 ksi) from RT to 800 C. However, the TiO_2 nucleating agent present in the usual LAS materials can cause matrix crystallization during hot-pressing and fiber-matrix interactions, making the fabrication of consistently high strength composites extremely difficult. The substitution of ZrO_2 for the TiO_2 appears to have eliminated this problem. Composites fabricated from SiC monofilament with a magnesium-aluminum-silicate (MAS) matrix have also exhibited high strengths from RT to 1000 C. Again, however, consistent fabrication of reproducibly high strength composites has been difficult due to lack of wetting and bonding between the SiC fibers and the matrix. GRA

N80-23380# General Dynamics Corp., San Diego, Calif. Convair Div.
APPLICATION OF GRAPHITE/EPOXY COMPOSITES FOR THE SPS-10 RADAR REFLECTOR Final Report, Jan. 1978 - Oct. 1979
Gary A. Tremblay Oct. 1979 82 p
(Contract N00024-78-C-5332; SF12141404)
(AD-A077530; GDC-SPS-79-001) Avail: NTIS HC A05/MF A01 CSCL 11/4

The General Dynamics Convair Division was contracted to evaluate the applicability of graphite/epoxy on the SPS-10 reflector. This task was a result of the Navy's study to reduce life cycle costs, acquisition costs, and structural weight of Naval antenna systems. The Convair effort began with a study of the RF performance of a graphite/epoxy grating panel, which proved to perform as well as its metal counterpart. We designed, fabricated, and tested a composite prototype unit of the reflector unit for performance approval. The graphite/epoxy reflector was mounted on a Navy-furnished SPS-10 spider and pedestal for structural (wind and vibration) and RF pattern range testing. All performance test results met or exceeded Navy specifications. Following testing at General Dynamics, the antenna was sent to the Naval Ocean Systems Center (NOSC), San Diego, California, for extended RF and environmental testing prior to shipboard evaluation. The Convair prototype SPS-10 reflector weighs 66.9 pounds (a 14% weight reduction compared to the metal SPS-10). An applications evaluation study during the program showed that a significantly greater weight savings, i.e., a 20.1-pound weight reduction for a 26% weight savings, and reduced fabrication costs could be realized for a production design of the SPS-10 reflector. GRA

FABRICATION AND PROPERTIES OF A PRESSURELESS SINTERED SILICON NITRIDE BASED ON Y2O3 AS SINTERING AID
A. Giachello, P. C. Martinengo, G. Tommasini, and P. Popper (British Ceram. Res. Assoc.) 1979 17 p refs Submitted for publication
Avail: NTIS HC A02/MF A01

A powder mixture 91% Si_3N_4 + 8% Y_2O_3 + 1% MgO was sintered at 1800 C in nitrogen at atmospheric pressure to a density of 3.25 Mg/cu m. The strength at room temperature was 585 MPa and at 950 C it was 560 MPa. Devitrification of an amorphous phase increased the strength at 1125 C by 44%. The linear shrinkage during sintering was 16%; thus it should be possible to fabricate complex shapes to high dimensional accuracy. The proposed sintering process overcame some of the disadvantages of the reaction-sintering and hot pressing processes. Various mechanical and thermal properties were determined. Author (ESA)

N80-23382# Fiat Research Center, Orbassano (Italy).
SINTERING OF SILICON NITRIDE IN A POWDER BED
A. Giachello, P. C. Martinengo, G. Tommasini, and P. Popper (British Ceram. Res. Assoc.) 1979 8 p refs Submitted for publication
Avail: NTIS HC A02/MF A01

Silicon nitride with the addition of MgO as a sintering aid can be sintered at atmospheric pressure by embedding the powder compacts in a loose powder mixture. By choosing a suitable composition of the powder in the bed, it is possible to control both the decomposition of the silicon nitride and the loss by volatilization of the MgO. In this way one can obtain homogeneously sintered articles of complex shapes of density greater than 3.0 Megagrams per cu m. Author (ESA)

Chromatographic materials were developed to serve as the stationary phase of columns used in the separation of atmospheric gases. These materials consist of a crosslinked porous polymer matrix, e.g., a divinylbenzene polymer, into which has been embedded an inorganic complexed ion such as N,N'-ethylene-bis-(acetylacetoniminato)-cobalt (2). Organic nitrogenous bases, such as pyridine, may be incorporated into the chelate polymer complexes to increase their chromatographic utility. With such materials, the process of gas chromatography is greatly simplified, especially in terms of time and quantity of material needed for a gas separation.

DEVELOPMENT OF DYNAMIC NMR PULSE TECHNIQUES AND APPLICATIONS TO MEMBRANE PERMEATION AND PEPTIDE BOND ROTATION KINETICS Ph.D. Thesis
Jeffry Roy Alger 1979 311 p
Avail: Univ. Microfilms Order No. 8011521

Nuclear magnetic resonance (NMR) techniques were developed for the measurement of phospholipid membrane permeation by small molecules. A magnetization transfer NMR pulse technique termed selective population transfer (SPT) was developed for this purpose. Membrane permeation was studied when the NMR signal arising from a solute entrapped within a limiting membrane was resolved from the signal arising from excluded solute permeation exchanges entrapped and excluded solute and introduced exchange effects into the NMR spectrum. When the permeation rate was similar to the nuclear relaxation rate, permeation was measured with SPT. Faster permeation rates were measured with classical techniques involving lineshape analysis. The longitudinal relaxation of the exchanging nuclear resonances was observed after one resonance was selectively inverted. Iterative nonlinear least squares curve fitting of the observed relaxation to the theoretical relaxation curves was employed to determine the exchange rates. Initially the SPT technique was tested by measuring the interconversion rate between the cis and trans peptide bond conformations for the dipeptide, glycylsarcosine. Dissert. Abstr.

A STUDY OF THE HYDROGEN ASSOCIATED WITH SUPPORTED AND UNSUPPORTED MOLYBDENUM OXIDE. 1: MOLYBDENA-ALUMINA CATALYSTS. 2: HYDROGEN MOLYBDENUM BRONZES Ph.D. Thesis
Alexander Carl Cirillo, Jr. 1979 268 p
Avail: Univ. Microfilms Order No. 8009232

Nuclear magnetic resonance (NMR) techniques were used to investigate the dehydroxylation of alumina and molybdena-alumina catalysts. The decrease in the percentage of hydroxyls observed by NMR with increasing temperature of dehydroxylation suggested a strong interaction between the unobservable hydroxyls, shown to be present by D2 exchange, and the Al(+3) ions exposed on the surface. The hydroxyls were restored to detection by NMR upon adsorption of D2O. The hydrogen spillover technique was used to form hydrogen molybdenum bronzes at 60 C by exposing platinized MoO3 to H2. Attempts to form lower bronzes, viz. H0.5MoO3, resulted in heterogeneous samples. The NMR lineshape observed at room temperature exhibited a total anisotropy of -23 ppm and was postulated to result from the extensive proton mobility in the irregularly shaped particles of the conducting oxide. Below 200 K, the proton mobility deceased and the homonuclear dipolar interaction became important; the lineshape became Lorentzian suggesting residual rotational motion. Dissert. Abstr.

AN ELECTRON SPECTROSCOPIC INVESTIGATION OF THE INTERACTION OF METHANOL AND AMMONIA WITH CLEAN AND PARTIALLY OXIDIZED ALUMINUM SURFACES Ph.D. Thesis
James William Rogers, Jr. 1979 281 p
Avail: Univ. Microfilms Order No. 8009920

The oxidation of clean polycrystalline Al and the interaction of CH3OH and NH3 with clean and oxidized Al surfaces were studied using both ultraviolet and X-ray photoelectron spectroscopy as well as X-ray excited Auger electron spectroscopy. Ultrahigh vacuum conditions in the temperature range 106-673 K were used. Low exposure of O2 at 128 K caused dissociation and subsequent incorporation of oxygen below the surface leaving a depletion layer rich in Al(delta +). Sorption at intermediate exposures led to the formation of amorphous Al2O3 islands while high exposures formed a thin layer of amorphous Al2O3 which covered the entire surface. The D2O initially dissociated and oxidized clean Al at 128 K followed by condensation at higher exposures. An increase in surface temperature led to the desorption of the condensed multilayer beginning near 180 K, leaving the surface partially hydroxylated at 200-270 K. Further increases in temperature converted the hydroxide to surface oxide (Al2O3) as did D2O adsorption at 300 K. Dissert. Abstr.

N80-23387 Ohio Univ., Athens.
THE IDENTIFICATION OF CHROMATOGRAPHICALLY SEPARATED FRACTIONS BY FOURIER TRANSFORM INFRARED SPECTROSCOPY Ph.D. Thesis
Donald Kuehl 1979 184 p
Avail: Univ. Microfilms Order No. 8010855

Improvements in the sensitivity and versatility of both a gas chromatography-Fourier transform infrared (GC/FT-IR) interface and a high performance liquid chromatography-Fourier transform infrared spectroscopy (HPLC/FT-IR) interface to aid in the identification of chromatographically separated fractions are described. The sensitivity of the FT-IR spectrometer was improved by using a dual beam optical subtraction technique which decreased the signal-to-noise ratio of the interferogram about zero retardation. This allowed a more sensitive mercury cadmium detector to be substituted for the conventional triglycine sulfate detector. This system was applied to support coated open tubular column GC/FT-IR measurements using a lightpipe which was optimum for these columns. This system was used to measure spectra of low nanogram quantities of sample, separated by SCOT columns. To lower the detection for compounds separated by HPLC below the microgram range, a microprocessor controlled HPLC/FT-IR interface was designed and constructed which used a diffuse reflectance sampling technique and automated solvent elimination. Dissert. Abstr.

N80-23388 Utah Univ., Salt Lake City.
NUMERICAL STUDIES OF PHYSICAL VAPOR TRANSPORT Ph.D. Thesis
David William Greenwell 1980 199 p

Avail: Univ. Microfilms Order No. 8011589

The viscous and gravitational influences on the mass transport formulations for vapor are studied. The treatment is limited to binary physical vapor transport in vertical right circular cylinders. Numerical solutions were obtained for the coupled mass momentum, and chemical species (diffusion) transport equations. Since gravitational influences were of interest, calculations were made with the assumption that the two components differed in molecular weight. The relation between the Reynolds number and the aspect ratio is discussed and the effect of the convective component of mass flow on the concentration gradients is described. Dissert. Abstr.

N80-23389 Pennsylvania State Univ., University Park.
THEORETICAL AND EXPERIMENTAL STUDIES ON THE DIELECTRIC AND OPTICAL PROPERTIES OF FLUIDS UNDER HIGH PRESSURE Ph.D. Thesis
Chung Chih Chen 1979 231 p
Avail: Univ. Microfilms Order No. 8010037

The variation of the refractive index of liquid with pressure to 14 kbar was determined by an optical interferometric method. The liquids studied were chloroform, carbon disulfide, o-xylene, n-xylene, 1-3-5 trimethyl benzene, cumene, methyl cyclohexane, ethyl bromide, ethyl iodide, i-butyl alcohol, ethyl alcohol, and deuterium oxide at room temperature. Since some of these liquids freeze at room temperature even before 14 kbar is reached, the measurements were carried out up to the freezing point or 14 kbar, whichever pressure is lower. In every case the refractive index increased with pressure with pronounced nonlinearity, particularly at high pressure. This nonlinearity was reduced considerably when the same data on delta n were considered as a function of the volume strain indicating that the nonlinear piezo-optic behavior of liquids was just a manifestation of nonlinear P-V relationship. Further, it is found that the slight nonlinearity noticed in the delta N-delta V/V sub o relationship could be still further reduced when the variation in refractive index is treated as a function of the Lagrangian and Eulerian strains. Other significant results are reported. Dissert. Abstr.

N80-23390 Iowa State Univ. of Science and Technology, Ames.
OXYGEN REDUCTION OF A GRAPHITE PASTE AND A CATALYST LOADED GRAPHITE PASTE ELECTRODE Ph.D. Thesis
Dennis Michael DiMarco 1979 164 p
Avail: Univ. Microfilms Order No. 8010226

Oxygen reduction was studied in basic solution at graphite paste electrode (GPE). The GPE was used as the disk of a rotating ring disk electrode (RRDE) and experiments were done using the voltage scan technique. The enhancements afforded by catalysts applied to the GPE were also studied. Oxygen reduction on a GPE was shown to be a two electron process resulting in the formation of peroxide. The Tafel slope was 180 mV. The presence of gold, silver, or platinum on the GPE shifted the oxygen reduction wave approximately 800 mV in the anodic direction. Comparison of the data on a metal catalyzed GPE to the solid metal electrode showed that the former electrode produced a greater fraction of peroxide as product than did the latter. Silver and gold catalyzed GPEs gave Tagel slopes of about 120 mV. The intermediate catalysis of iron and cobalt porphyrin was also examined. While the cobalt porphyrin catalyzed oxygen reduction at a more anodic potential than the iron porphyrin, the latter appeared more active in reacting the peroxide formed as the product of the disk reaction. Dissert. Abstr.

N80-23391 Georgia Inst. of Tech., Atlanta.
IMPROVEMENTS IN DETECTION CAPABILITIES IN ATOMIC SPECTROSCOPY Ph.D. Thesis
John William Novak, Jr. 1979 175 p
Avail: Univ. Microfilms Order No. 8010004

High powered pulsed, ratio frequency (RF) - excited, electrodeless discharge lamps (EDLs) were characterized as possible sources for atomic spectroscopy. Novel behavior of the lamps was observed when they were operated in a pulsed mode. The radiant output of the EDLs was found to increase rapidly when short pulses were used, at incident powers where continuous wave (CW) operation of the lamps often resulted in decreased radiant output, thus indicating different excitation processes in the two modes of operation. The behavior of RF-excited Ar, Hg, Cd and Zn EDLs were compared with microwave excited lamps for the same elements. The process of liquid sample introduction into flames and plasmas was evaluated. An aerosol monitoring system was developed capable of measuring size distributions of spray droplets produced from common nebulizers used for analytical atomic spectrometry. The system provided a means for the systematic characterization of droplet sizes of the various sprays in the diameter range 0.10 to 10 micrometers. Droplet distributions were obtained using a cascade impactor operated in series with an electrical aerosol analyzer. Results are presented. Dissert. Abstr.

N80-23392 American Univ., Washington, D. C.
ELECTRO-OXIDATION OF HYDROGEN AND PROPANE IN STRONG ORGANIC ACID ELECTROLYTES Ph.D. Thesis
Jalil Ahmad 1980 128 p
Avail: Univ. Microfilms Order No. 8010687

The electrochemical behavior of methane sulfonic acid, ethane sulfonic acid, and sulfoacetic acid as fuel cell electrolytes was studied in a half cell at various temperatures. The methane sulfonic acid and ethane sulfonic acid have shown no promise with propane and therefore cannot be used as potential electrolytes for the hydrocarbon-air fuel cell. Adsorption on the platinum electrode surface and decomposition during electrolysis of these acids was also observed. Sulfoacetic acid with H2 supported about two times higher current density than trifluoromethane sulfonic acid monohydrate. It is concluded that the sulfonic acids containing unprotected C-H bonds are strongly adsorbed on the platinum surface, and decompose easily during the electrolysis; thus, a preferred electrolyte should be substituted sulfonic acid. Dissert. Abstr.

(NASA-TM-80666) Avail: NTIS HC A02/MF A01 CSCL 07D

Absolute rate constants for the reaction OH + H2CO measured over the temperature range 228-362 K using the flash photolysis-resonance fluorescence technique are given. The results are independent of variations in H2CO concentration total pressure Ar concentration, and flash intensity (i.e., initial OH concentration. The rate constant is found to be invariant with temperature in this range, the best representation being k sub 1 = (1.05 + or - 0.11) x 10 to the 11th power cc molecule (-1) s (-1) where the error is two standard deviations. This result is compared with previous absolute and relative determinations of k sub 1. The reaction is also discussed from a theoretical point of view. M.G.

(AD-A081516; AFGL-TR-79-0092) Avail: NTIS HC A04/MF A01 CSCL 11/6

An experiment attempting to measure the thermal and near-thermal rate coefficients for reactions of metal ions with O and O3 is summarized. The method involves a new type of drift tube made of a fully oxidized leaky dielectric material (Cerramag C-11) which permits placing of the drift field without metallic electrodes which could degrade O and O3 into O2 in surface reactions. In the experiments Al(-) from an external surface ionization source was used, the drift gas was argon to which the reactant gas was added, and ions emerging from the drift tube were mass spectrometically detected. It was found by modulated beam mass spectrometry that ozone was not degraded in the drift tube; the atom content in partially dissociated oxygen admitted to the tube was too low to get unequivocal data on the integrity of O in the tube. This report summarizes current research into the application of infrared and Raman spectroscopy to the study of passive films on metals. One section of the report discusses the results of computer interfacing of the Raman spectrometer with a minicomputer to produce signal averaged spectra. The signal-averaged Raman spectra reveal spectral details undistinguishable in a single spectrum. A parallel study involved exposure of iron, chromium, and two commercial iron-chromium alloys. GRA

MICROWAVE SPECTROMETER FOR THE DETECTION OF TRANSIENT GASEOUS SPECIES
W. F. Kolbe, Wolf-Dieter Zoellner, and B. Leskovar 1 Jun. 1979 30 p refs
(Contract W-7405-eng-48)
(LBL-7293) Avail: NTIS HC A03/MF A01

A microwave spectrometer and the associated apparatus used to detect unstable free radical species is described. The spectrometer, which operates over a frequency range from 66 to 73 GHz consists of a tunable Fabry-Perot resonator followed by superhetrodyne detection for high sensitivity at low power levels. The resonator tuning is accomplished by means of a computer controlled stepping motor and by a piezoelectric transducer which also permits the use of source modulation and phase sensitive detection at 100 Hz. The operations of the spectrometer is

demonstrated by the detection of the two free radical species OH and SO. In the case of OH, a number of lambda doubling transitions, previously unobserved, are reported. DOE

COHERENT ANTI-STOKES RAMAN SCATTERING AT ELECTRONIC RESONANCE: APPLICATION TO IODINE Thesis - Paris-Sud Univ.
Brigitte Attal 1979 91 p refs IN FRENCH; ENGLISH summary Report will also be announced as translation (ESA-TT-608)
(ONERA-NT-1979-4) Avail: NTIS HC A05/MF A01

The main properties and application of Coherent Anti-Stokes Raman scattering (CARS) are first detailed and the advantages of resonant excitation pointed out. In particular, the intensities of the Raman lines must be enhanced by several orders of magnitude. Specificity is thus improved and detection of trace pollutants in mixtures becomes possible. Results of experiments with NO2 and I2 are presented, and a study of iodine (partial pressure of 1 mb) in air in normal conditions is made. Two spectra were plotted for two distinct values of the laser frequency omega L in the proximity of the B-X transition absorption lines. Enhancement of the intensities of the CARS lines by one photon resonance is experimentally confirmed in iodine. Author (ESA)

Reactions of NH2 radicals with nitrogen-oxygen compounds and hydrocarbons were investigated in a flow reactor at temperatures between 203 K and 505 K and pressures between 0.8 mbar and 21 mbar. In [illegible] ases, reaction products were detected using mass spectroscopy. NH2 radicals were produced in the reaction F + NH3 yields NH2 + NF and were monitored by laser induced fluorescence. Temperature dependencies at 1.3 mbar were determined for the reactions of NH2 with NO, NO2 and C2H2. The rate constant of the reaction NH2 + C2H4 was independent of temperature within experimental error. Author (ESA)

GRAVIMETRIC DETERMINATION OF GAS SORPTION BY MEANS OF AN ELECTRONIC MICRO-BALANCE
G. Sandstede (Battelle Inst.) and E. Robens (Battelle Inst.) 1979 15 p refs Transl. into ENGLISH from Chem.-Ing.-Tech. (West Germany), no. 6, 1960 p 413-417 In ENGLISH and GERMAN
(PNR-90009; Trans-14483) Avail: NTIS HC A02/MF A01

A vacuum apparatus for the gravimetric measurement of sorption, in which pressure and quantity of sorbate are determined independently of each other (the quantity of sorbate by weighing), is described. Using a electronic microbalance, the apparatus enables the sorption of gases and vapors at pressures between .000005 Torr and 1 at m to be measured, and the shape of complete sorption isotherms to be recorded with a constant degree of accuracy. The lower limit of the surface of a weighed sorption sample for surface determination by the BET method is approximately 100 sq cm. Measurements were made of the adsorption of nitrogen and krypton on aluminum foil and aluminum powder, as well as on aluminum oxide and glass spheres, in order to compare the results of the BET surface determination with measured geometric surface values, as well as to determine the surface loading of a krypton atom and the pore radius distribution from description isotherms. In addition, the effect of various surface finishes on the shape of the isotherms was investigated for aluminum. Author (ESA)

The theoretical schemes determining the early NO concentrations were verified by comparison with experimental results obtained in a stirred combustor. The influence of water vapor on early NO formation, from both the experiment and theoretical viewpoints, is also emphasized. The experimental early NO concentration, obtained in a Longwell type combustor, was determined to be the difference between the experimental NO and the thermal NO calculated using the Zeldovich mechanism, while taking into account an over-equilibrium of O. A process involving HCN is suggested as a explanation of the phenomenon. The Miyauchi model, complemented by the Jachimowski reactions, accounts exactly for the experimental early NO with a residence time on the order of 1 ms; for higher residence times, the calculation is much more complex. Results on the influence of water on nitrogen oxides are presented. Calculations made it possible to determine this effect, which is essentially thermal for lean mixtures; it is more complex for rich mixtures.

CHEMICAL REACTIONS IN A TURBULENT MEDIUM Thesis - Paris VI Univ.
Roland Borghi 1979 99 p refs In FRENCH; ENGLISH summary
Report will also be announced as translation (ESA-TT-638)
(ONERA-NT-1979-2; ISSN-0078-379X) Avail: NTIS HC A05/MF A01

Different aspects of reactive turbulent flows are discussed including: the turbulent diffusion of possibly reactive species in a medium with variable density, the analysis of fluctuations of species concentrations, and the calculation of the mean reaction rate. Using partial differential equations for the moments of fluctuations together with particular closure assumptions, solutions for these problems are proposed. Two applications are highlighted. The first deals with the development of a high velocity premixed flame in a constant area duct. The second is devoted to the combustion in a fixed volume burner. The influence of such small scale disturbances on the rate of energy release and on the production of pollutant species NOx is discussed.

HEROP: A COMPUTER PROGRAM FOR THE THERMODYNAMIC AND THERMOPHYSICAL PROPERTIES OF HELIUM, THIRD EDITION
B. A. Hands Apr. 1979 69 p refs
(OUEL-1289/79) Avail: NTIS HC A04/MF A01

A set of FORTRAN subprograms called HEPROP used to calculate the thermophysical properties of helium are presented. The thermodynamic properties are derived from the equation of state which is valid from about 2 K to 1700 K, and up to about 100 MPa. By analytical differentiation and integration, pressure (P), enthalpy (h), entropy (s), (delta P/delta T) sub rho, (delta P/delta rho) sub T and C sub v are calculated as a function of density (rho) and temperature (T). Equations are provided for pressure, liquid density and vapor density at saturation. In addition, programs are given for C sub p, h sub fg, s sub fg, the velocity of sound and the Joule-Thomson coefficient. Programs are also devised to calculate T as a function of (rho, P), (P, h), (rho, h), (rho, s) and (P, s); and rho as a function of (P, T) (T, s), (P, h) and (R, s). Subprograms for calculating rho as a function of (P, H), H as a function of (P, S), S as a function of (P, H), and T as a function of (P, H) and for saturation enthalpy are also included. Equations for surface tension, viscosity, refractive index thermal conductivity and dielectric constant are included in HEPROP.

(Contract DI-14-34-0001-7510)
(PB80-126204; W80-02296; OWRT-7510(1); Rept-1093-25)
Avail: NTIS HC A03/MF A01 CSCL 07D

Chemcially stable noncellulosic desalination membranes were developed with reverse osmosis properties at pressures of 250 psi or less that are equivalent to those of currently available cellulosic membranes operating at 400 psi. Several membranes were investigated. One membrane consisted of a thin layer of sulfonated polyfurfuryl alcohol on a microporous polysulfone as a support (SPFA). This membrane exhibited water flux values up to 50 gfd at 98% salt rejection when tested at 250 psi with 0.5% sodium chloride. Subsequent long term testing of the membrane in element form at 100 to 300 psi showed that it was unstable to simulated Yuma feedwater. Another membrane of interest was asymmetric and was fabricated from a sulfonated polysulfone.

DETERMINATION AND ESTIMATION OF IONIC ACTIVITIES OF METAL SALTS IN WATER
N. A. Gokcen 1979 29 p refs
(PB80-112212; BM-RI-8372) Avail: NTIS HC A03/MF A01 CSCL 07D

Appropriate equations correlating the activity of water with the activities of electrolytes in binary and multicomponent solutions were derived for computer calculation. It was found that the half-integer power series are far superior to the integer power series, for both types of series having the same number of terms. The proposed method of calculation is capable of accurately yielding the activities of all components from the measurements of the activity of a single component at various concentrations. This method replaces the cumbersome and objectionable method of graphical integration of the Gibbs-Duhem equation.

PREPARATION OF MONOTECTIC ALLOYS HAVING A CONTROLLED MICROSTRUCTURE BY DIRECTIONAL SOLIDIFICATION UNDER DOPANT-INDUCED INTERFACE BREAKDOWN Patent
Richard A. Parr, Mary H. Johnston, and John C. McClure, inventors (to NASA) Issued 15 Apr. 1980 8 p Filed 29 Dec. 1978 Supersedes N79-16943 (17 - 08, p 0953)
(NASA-Case-MFS-23816-1; US-Patent-4,198,232; US-Patent-Appl-SN-974292; US-Patent-Class-75-135; US-Patent-Class-75-138; US-Patent-Class-75-178R; US-Patent-Class-148-32) Avail: US Patent and Trademark Office CSCL 11F

Monotectic alloys having aligned spherical particles of rods of the minor component dispersed in a matrix of the major component are prepared by forming a melt containing predetermined amounts of the major and minor components of a chosen monotectic system, providing in the melt a dopant capable of breaking down the liquid solid interface for the chosen alloy, and directionally solidfying the melt at a selected temperature gradient and a selected rate of movement of the liquid-solid interface (growth rate). Shaping of the minor component into spheres or rods and the spacing between them are controlled by the amount of dopant and the temperature gradient and growth rate values. Specific alloy systems include Al Bi, Al Pb and Zn Bi, using a transition element such as iron.

INVESTIGATIONS INTO THE GRAIN REFINEMENT OF COPPER Ph.D. Thesis
Bruce Lee Tuttle 1979 174 p
Avail: Univ. Microfilms Order No. 8010106

Special melting procedures were established to control the as-melted constitution of copper. A series of criteria were developed to characterize those compounds that would be suitable inoculants for copper. A model was designed to characterize the growth restricting potential of individual element in copper. A thermal analysis testing procedure was developed to instantaneously evaluate the degree of grain refinment in castings. A testing system was also developed utilizing a commercially available thermal analysis mold and a customized potentiometric recorder to produce a temperature vs time curve. Dissert. Abstr.

STRESS CORROSION CHARACTERISTICS OF AL-Zn-Mg ALLOYS WITH COPPER ADDITIONS Ph.D. Thesis
Bhaskar Sarkar 1979 123 p
Avail: Univ. Microfilms Order No. 8010006

Four Al-6Zn2Mg-xCu alloys with similar microstructures but different copper contents were chosen to investigate the effect of copper in the stress corrosion cracking characteristics in an aqueous solution of 3.5% NaCl. The nominal copper contents were 0%, 1%, 1.6% and 2.1%. Stress corrosion cracking in this alloy system is intergranular and both anodic dissolution of grain boundary precipitates and hydrogen embrittlement are possible mechanisms. Precracked double cantilever beam specimens, loaded to constant crack opening displacements were used to determine the stress corrosion crack growth kinetics as a function of stress intensity. Increasing the copper content of the Al-Zn-Mg alloys in the -T651 condition was found to improve the SCC resistance. An overaging treatment improves the SCC characteristics of the copper-free alloy by increasing the homogeneity of deformation. The improvement in the copper-containing alloys is attributed to the eta phase becoming still less anodic (as compared to that in -T651 condition) because more copper enters the eta phase from solid solution during overaging. This further reduces the rates of electrochemical dissolution and/or hydrogen embrittlement. Dissert. Abstr.

N80-23422 Clarkson Coll. of Technology, Potsdam, N.Y.
DIRECTIONAL SOLIDIFICATION OF MANGANESE-BISMUTH/BISMUTH ALLOYS Ph.D. Thesis
P. S. Ravishankar 1980 227 p
Avail: Univ. Microfilms Order No. 8011197

Eutectic and off-eutectic alloy of MnBi/Bi were directionally solidified in a Bridgman-Stockbarger apparatus to determine the dependence of the fiber spacing on the growth parameters growth rate and interfacial temperature gradient. The growth rate was varied from 0.6 cm/hr to 30 cm/hr. Techniques were developed to measure the temperature profile in the melt and hence obtain the interfacial temperature gradient. Transverse sections of the solidified alloys were examined in a optical or scanning electron microscope and the fiber spacing measured. Fiber spacing varied as the inverse square root of growth rate as predicted by theory. The temperature gradient did not influence fiber spacing. This contradicts those claims that all faceted/non-faceted class of eutectics should show a temperature gradient influence. For the cases where such an influence was observed in the literature, a new hypothesis is proposed. The actual fiber spacing adjustment mechanism is not clear. Interface position measurements resulted in good agreement with the existing one dimensional heat transfer models. Dissert. Abstr.

N80-23423 Georgia Inst. of Tech., Atlanta.
THE EFFECTS OF DEFORMATION MODE ON THE BEHAVIOR OF Ti-28%V AND Ti-32%V ALLOYS Ph.D. Thesis
Tapas Kumar Mukhopadhyay 1979 99 p
Avail: Univ. Microfilms Order No. 8010566

Low cycle and high cycle fatigue tests were performed to determine the fatigue performance of Ti-28%V and Ti-32%V alloys in the metastable b.c.c. states under total strain and total load control modes. Effects of strain rate variation and spiked loading were also monitored. The planar slip Ti-32%V exhibited fatigue softening at low strain amplitudes and fatigue hardening at high strain amplitudes. The multiple (wavy) slip Ti-28%V alloy exhibited fatigue hardening at all strain amplitudes tested. A break in the Coffin Manson plot was observed at a strain amplitude of -0.0035 for both of the alloys. A similar break was also observed in the cyclic stress-strain plot. A reduction in the strain rate by an order of magnitude affected the two alloys differently. The Ti-32%V planar slip material exhibited increased hardening with decreased strain rate, whereas Ti-28%V alloy with its higher twin fault probability exhibited a typical b.c.c. behavior. The multiple (wavy) slip Ti-28%V alloy exhibited a diminished fatigue life at all strain amplitudes as compared to that of the planar slip Ti-32%V alloy. Within the scatter-band, the high cycle fatigue life for the planar slip material and the multiple (wavy) ship material was found to be similar. This suggests that the macroscopic deformation mechanism does not dictate the high cycle fatigue life. Dissert. Abstr.

N80-23424 Georgia Inst. of Tech., Atlanta.
THE EFFECT OF MICROSTRUCTURE ON THE FATIGUE BEHAVIOR OF AN ALUMINUM-LITHIUM ALLOY Ph.D. Thesis
Edward James Coyne, Jr. 1979 145 p
Avail: Univ. Microfilms Order No. 8010565

The monotonic and fatigue behavior of an aluminum-lithium-manganese alloy was investigated. The properties of an aluminum-copper-lithium alloy, were examined in order to have a lithium alloy as a base for comparison. The Al-Li-Mn material was studied in an underaged, peak aged and overaged condition. The grain structure of the three heat treatments were the same while the different size precipitates were responsible for differences in deformation characteristics. The underaged and peak aged alloys deformed by planar slip. The larger particle size and interparticle spacing of the overaged condition resulted in a combination of planar slip and Orowan looping. The Al-Cu-Li alloy deformed primarily by planar slip. The fatigue crack propagation data show that the crack propagation rates of Al-Li-X alloys are less than those of other aluminum alloys at low stress intensity factors due to the high modulus and low crack opening displacement of these alloys. Dissert. Abstr.

A SURFACE ANALYSIS STUDY OF CARBON MONOXIDE AND HYDROGEN ABSORPTION AND DESORPTION OF

Ni(3) CRYSTALS Ph.D. Thesis
James Lih-Ren Chao 1979 194 p
Avail: Univ. Microfilms Order No. 8011118

Low energy electron diffraction and Auger electron spectroscopy were used to analyze nickel single crystal surfaces in order to understand nickel catalytic reactivity. The adsorption and desorption of CO and H2 were investigated. An additional nickel sample with small angle boundaries was used to examine the effect on the reactivity of the discontinuity caused by the boundary lines. The sulfur poisoning problem was also investigated. Results discussed include desorption states, activation energy, and temperature and pressure effects. Dissert. Abstr.

N80-23426 Rensselaer Polytechnic Inst., Troy, N. Y.
FATIGUE CRACK PROPAGATION IN A DIRECTIONALLY SOLIDIFIED COBALT-BASE EUTECTIC Ph.D. Thesis
Curtiss Mitchell Austin 1979 153 p
Avail: Univ. Microfilms Order No. 8011496

Fatigue crack propagation (FCP) in a Co-base aligned eutectic, Cotac (Co-10Ni-10Cr-15TaC), was investigated extensively, with temperature, environment, frequency and load waveform and load waveform as experimental variables. Emphasis was directed toward the determination of the role of fibers, using interfiber spacing, fiber orientation, fiber integrity, and the absence of fibers as material variables. The FCP rates at high delta K are affected by most of these material variables, but are not affected by pre-existing fiber failure produced by prestraining. The FCP rates at low delta K are not affected by any of the material variables. Results indicate that fatigue crack propagation in Cotac is generally matrix controlled, provided that it is understood that at high delta K the matrix is influenced by the presence of fiber segments. At high delta K, the critical crack advance event occurs within a plastic zone containing only segmented fibers.

Gary Max Michal 1980 295 p
Avail: Univ. Microfilms Order No. 8011682

Various techniques of high resolution transmission electron microscopy to obtain a more thorough characterization of the premartensitic and martensitic transformations in TiNi than previously obtainable. Using an electron microscope equipped with a LaB6 filament detailed aspects of the structure were obtained through structure and high resolution dark field imaging, in situ heating and cooling experiments and 2 1/2 D microscopy. The technique of 2 1/2 D electron microscopy is shown to have a much greater potential than previously thought in determining the orientation changes or difference in lattice plane spacings in crystalline solids. A theoretical model and experimental evidence are presented to determine the limit of how closely spaced diffraction vectors are and still be correlated with their microstructural features. The results indicate that diffraction spot separations of 0.5nm-1 can be measured and unambiguously correlated with features in the dark field stereo pair while maintaining an image resolution of lnm.Dissert. KINETIC AND THERMODYNAMIC STUDIES OF LIQUID METAL-OXYGEN SYSTEMS USING SOLID STATE ELECTROCHEMICAL TECHNIQUES Ph.D. Thesis
Bahman Heshmatpour 1980 333 p
Avail: Univ. Microfilms Order No. 8011647

The influence of small additions of the solutes tin, lead, copper, silver and titanium on the diffusivity, the solubility, the activity and the activity coefficient of oxygen in liquid indium was studied for the temperature range 750 to 950 C using solid state electrochemical techniques. Sharp increases in oxygen diffusivity and decrease in oxygen solubility were observed in all cases when these solutes were added to indium. Modest increases in oxygen diffusivity were observed for higher solute concentrations. Oxygen showed Henrian behavior up to the maximum oxygen solubility for all the temperatures and solute concentrations. The results indicated that the addition of a less reactive metal to a more reactive metal increases the oxygen diffusivity and decreases the oxygen solubility in the more reactive metal. A solubility diffusivity correlation proved to be valid for all the indium-solute-oxygen systems. The thermodynamics of liquid binaries of indium-solutes were also studied using a solid oxide electrochemical method up to 10 atomic percent of these solutes. Dissert. Abstr.

CRYSTALLOGRAPHY IN FUSION-WELD-METAL SOLIDIFICATION MECHANICS Ph.D. Thesis
Jay Morris Samuel 1979 186 p
Avail: Univ. Microfilms Order No. 8011510

Extensive X-ray diffraction work and metallographic examination of bead-on-plate fusion welds in cube-on-face oriented silicon iron revealed the the substructure characteristics were controlled to a large extent by crystallographic considerations. It was observed that the substructure width increased with increasing angular deviation between the direction of G sub L and the nearest < 100 > crystallographic direction in the solid. Furthermore, it was also noted that the substructure growth mode gradually changed in appearance from a cellular to a cellular dendritic geometry as the angular deviation increased. These changes in substructure characteristics were attributed to a modification of the effective constitutional supercooling experienced at the growing cell tips as a result of the orientation of the cell axes with respect to the direction of G sub L.

PRACTICAL APPLICATIONS OF SURFACE ANALYTIC TOOLS IN TRIBOLOGY
John Ferrante 1980 45 p refs Presented at the Intern. Lubrication Conf., San Francisco, 18-21 Aug. 1980; sponsored by ASME and ASLE
(NASA-TM-81484; E-422) Avail: NTIS HC A03/MF A01 CSCL 20K

A brief description of many of the widely used tools is presented. Of this list, those which have the highest applicability for giving elemental and/or compound analysis for problems of interest in tribology along with being truly surface sensitive (that is less than 10 atomic layers) are presented. The latter group is critiqued in detail in terms of strengths and weaknesses. Emphasis is placed on post facto analysis of experiments performed under real conditions (e.g., in air with lubricants). It is further indicated that such equipment could be used for screening and quality control. R.C.T.

QUANTITATIVE FRACTOGRAPHY OF A FATIGUED TI-28 W/O V ALLOY
Ervin E. Underwood and Saghana B. Chakrabortty 27 Nov. 1979 35 p refs
(Contract N00014-75-C-0349)
(AD-A079813; GIT-TR-79-1) Avail: NTIS HC A03/MF A01 CSCL 11/6

A quantitative fractographic analysis was undertaken to study the microstructural features important in the understanding of the mechanisms of fatigue crack growth and in the prediction of fatigue crack propagation rates. Special emphasis in this work is placed on the facet characteristics and sub-surface cracking. The stereological treatment of this problem develops methodologies and relationships based primarily on vertical sections through the fracture surface and parallel to the crack propagation direction. The evaluation of fracture profiles (in terms of true length, roughness, and degree of orientation) permits calculation of fracture surface characteristics (such as true surface area, roughness, and type of surface - the latter through an upper-lower bound approach). ADHESIVE BONDING EXPERIMENTS FOR TITANIUM 6 ALUMINUM 4 VANADIUM (Ti6Al4V). PART 1: ANODIZATION TREATMENTS Final Report, Jul. 1978 - Aug. 1979
William L. Baun Dec. 1979 42 p refs
(AF Proj. 2419)
(AD-A081538; AFML-TR-79-4172-Pt-1) Avail: NTIS HC A03/MF A01

Evaluations of surface treatments for adhesive bonding of Ti6Al4V were carried out using lap shear, peel and thick-thin wedge tests. Anodization to form dense oxides from 100-3000 A in thickness had little effect on bond strength or durability. Properties were governed by chemical pretreatments. Fluorine present in the anodization bath can cause oxide/alloy failures and should be avoided. GRA

A borax-nitrite based inhibitor has been developed for incorporation into the Air Force Rinse Facility at MacDill Air Force Base. Chromate-based products, in combination with polyphosphates, have been reasonably effective against corrosion of ferrous and nonferrous metals and alloys and are presently the most widely used inhibitors. However, the use of chromates has been the subject of ecological concern, and the investigation discussed herein involves alternatives to chromates. The performance of nonchromate commercial inhibitors has been tested and a borax-nitrite based formulation developed which inhibits the corrosion of several ferrous and nonferrous metals and alloys. This mixture contains no chromates and offers important advantages over the chromate-polyphosphate combination. Corrosion-fatigue and crack-growth studies on aluminum alloys have shown a reduction of more than one order of magnitude in crack-growth rate in the presence of this inhibitor. In fact, the crack growth decelerates to the air-sample level with the use of the inhibitor, even in an aqueous environment of 0.1M NaCl solution. GRA

INHOMOGENEOUS BROADENING EFFECTS IN CW CHEMICAL LASERS Interim Report
Harold Mirels Los Angeles SAMSO Sep. 1979 66 p refs
(Contract F04701-78-C-0079; DARPA Order 2843)
(AD-A077319; TR-0079(4764)-1; SAMSO-TR-79-85) Avail: NTIS HC A04/MF A01 CSCL 20/5

The effects inhomogeneous broadening on the performance of CW chemical lasers were investigated. A simple two level vibrational model and a Fabry-Perot resonator were assumed. Laser performance was found to depend on certain parameters. The numerical results are given for a CW chemical laser with laminar diffusion and with a single longitudinal optical mode. The variation of differential number density with local lasing intensity and streamwise distance and the variation of net laser output power with tuning frequency are presented. The latter exibits a lamp dip near line center. Other significant results are presented. R.C.T.

SUPERPOSITION OF ALLOY HARDENING, STRAIN HARDENING, AND DYNAMIC RECOVERY
U. F. Kocks 1979 22 p refs Presented at the 5th Intern. Conf. on Strength of Metals and Alloys, Aachen, West Germany, Aug. 1979 Sponsored in part by Federal Republic of Germany
(Contract W-31-109-eng-38)
(CONF-790801-6) Avail: NTIS HC A02/MF A01

The principles and heuristics of flow stress superposition are illustrated for the case that one of the components is due to dislocation/dislocation interactions and is the only one that changes with strain. A simultaneous investigation of the flow stress and its rate sensitivity as a function of strain is described. It is shown that the slope of the observed stress strain curve depends on the form of the superposition law even if there is no physical influence of alloying on the dislocation storage rate; the frequently observed low initial strain hardening associated with a higher yield stress may in some cases be merely a consequence of a nonlinear superposition. It is also shown that higher strains, the influence of alloying a dynamic recovery becomes the predominant effect; it also controls the high temperature creep strength. When dynamic recovery plays an important role, it provides a further straining mechanism which, however, is not additive to the low temperature strain rate; a form of the superposition law for long range slip and this dynamic recovery strain is proposed. An application of these principles has demonstrated that dynamic strain aging is due to an effect of mobile solute atoms on the strain hardening component of the flow stress, not on the friction stress. MECHANICAL PROPERTIES OF COLD-WORKED 5083 ALUMINUM
M. E. Prado and J. J. Scott 6 Mar. 1979 16 p refs
(Contract W-7405-eng-48)
(UCID-18179) Avail: NTIS HC A02/MF A01

Tensile and fracture toughness tests of 25% cold worked 5083 aluminum and weld material were conducted. The tests showed that the aluminum is highly nonhomogeneous; its fracture toughness, elongation, and percent reduction in area varied greatly from point to point. This characteristic could significantly affect the design of 5083 applications. The weld material exhibited more uniform mechanical properties throughout the weld. However, its fracture toughness varied from 19 to 43 ksi in./sup 1/2/. The weld-joint geometry affects the fracture characteristics of the joint. DOE

METASTABLE PHENOMENA IN HYDROGEN DEGRADATION OF LOW CARBON ALLOY STEELS Interim Report, Dec. 1977 - Nov. 1978
L. S. Darken and E. R. Ryba EPRI Palto Alto, Calif. Sep. 1979 39 p refs
(EPRI-AF-1176) Avail: NTIS HC A03/MF A01

According to thermodynamic calculations, The inclusion of chromium and other strong carbide-forming elements in steels should significantly lower the activity of carbon so that methane does not form in hydrogen atmospheres at moderate temperatures. However, degradation of low alloy steels does occur, and it is suggested that a metastable equilibrium condition exists in which the carbon atoms cluster around the atoms of the alloying elements in the ferrite phase and assume a higher activity. This suggestion has now been substaniated by the results of carbonization experiments in which pure iron and iron-chronium alloys have been exposed to atmospheres of varying carbon activities at 600 C and 700 C. Measurement of weight changes by thermogravimetry clearly shows that the solubility of carbon in the alloy ferrite is in excess of that in pure iron. DOE

HYDROGEN ATTACK OF STEEL Progress Report, 1 Apr. 1979 - 31 Mar. 1980
Paul G. Shewmon 2 Jan. 1980 9 p refs
(Contract EY-76-S-02-2872)
(COO-2872-04) Avail: NTIS HC A02/MF A01

The atomic processes by which the hydrogen attack of pressure vessel steel occurs were investigated by the following: the growth kinetics using an exceptionally sensitive dilatometer.

These data were compared with the predictions of models based on the postulated mechanisms. Scanning electron microscope studies were conducted to establish the geometry and location of the growing methane bubbles. The steels used were various commercial alloys because of the new confirmed suspicion that trace impurities, e.g., from dioxidation practice, play a central role in determining the nucleation and growth geometry of the bubbles or fissures. CREEP-RUPTURE BEHAVIOR OF 2-1/4Cr-1 Mo STEEL, ALLOY 800H AND HASTELLOY ALLOY X IN A SIMULATED HTGR HELIUM ENVIRONMENT
G. Y. Lai and R. J. Wolowowicz Dec. 1979 75 p refs
(Contract DE-AT03-76ET-35300)
(GA-A-15572) Avail: NTIS HC A04/MF A01

Testing was conducted in flowing helium containing nominal concentration of following gases: 1500 micron atm H2, 450 micronatm CO, 50 micronatm H2O and 5 micronatm CO2 to represent maximum permissible levels of impurities in the primary coolant for the steam-cycle system of a high-temperature gas-cooled reactor (HTGR) when it is operating continuously with a water and/or steam leak at technical specification limits. Two or three heats of material for each alloy were investigated. Tests were conducted a 482 C and 760 C (1200 F and 1400 F) for Alloy 800H, and at 760 C and 871 C (1400 F and 1600 F) for Hastelloy Alloy X for times up to 10,000 h. Selected tests were performed on same heat of material in both air and helium environment to make a direct comparison of creep-rupture behaviors between two environments. Metallurgical evaluation was performed on selected post test specimens with respect to gas-metal interactions which included oxidation, carburization and/or decarburization. Correlation between gaseous corrosion and creep-rupture behavior was attempted. Limited tests were also performed to investigate the specimen size effects on creep-rupture behavior in the helium environment. DOE

CHEMICAL DECONTAMINATION OF METALS
Jerry A. Partridge and Ronald E. Larch Oct. 1979 22 p refs Presented at the Am. Nucl. Soc. Meeting, San Francisco, 11-15 Nov. 1979
(Contract EY-76-C-14-2170)
(HEDL-SA-1880; CONF-791103-66) Avail: NTIS HC A02/MF A01

A metal decontamination process based upon removal of contamination by treatment with a cerium (4) nitric acid solution (or other redox agent in nitric acid) is feasible and highly promising. The technique is effective in dissolving the surface layer of stainless steel. Dissolution rates of approximately 1.5 mils/h were demonstrated with cerium (4) nitric acid solutions. Removal of plutonium contamination from stainless steel was demonstrated in laboratory tests, in which activity levels were reduced from greater than 500,000 counts per minute to nondetectable levels in approximately one hour at 90C. Removal of paint from stainless steel surfaces was also demonstrated. Advantages of this process include: (1) There is potentially less waste generated; (2) cerium 4 in nitric acid is a good dissolution agent for plutonium oxide; (3) regeneration of Ce4 during the decontamination is accomplished by electrolysis; (4) the process should be effective for irregularly shaped equipment; (5) it could be effective as a spray or a flow-through system. ANALYSIS OF POSSIBLE IMPROVEMENTS OF ALLOYS DUE TO DIRECTIONAL EUTECTIC SOLIDIFICATION IN ZERO GRAVITY CONDITIONS
Hans Ahlborn and Ruediger Rothe Nov. 1979 57 p refs Transl. into ENGLISH of "Analyse der Erreichbaren Verbesserungen bei Legierungen Aufgrund Gerichteter Eutektischer Erstarrung unter Weltraumbedingungen", Rept. BMFT-FB-W-77-15 BMFT and Hamburg Univ., Bonn., Dec. 1977 Original report in GERMAN previously announced as N79-30371
(ESA-TT-575; BMFT-FB-W-77-15) Avail: NTIS HC A04/MF A01; ZLDI, Munich DM 13.50

Eutectic alloys having undergone directional solidification in a temperature gradient already in use, being developed, and/or known from the literature were analyzed for their mechanical, electrical, magnetic, and optical properties. These characteristics were evaluated with respect to possible improvement through production in space. Results show that with the absence of thermal convection which affects the formation of structures on Earth, an improvement in the microstructure and hence in the properties of the alloys can be expected from zero gravity manufacture. It is anticipated that space processing will in particular bring advantages for eutectics whose properties are substantially influenced by the regularity of the structure, e.g., eutectics intended for optical applications. STRESS-BIREFRINGENCE-STRAIN RELATIONS IN POLYMER NETWORKS WITH SPECIALLY DESIGNED STRUCTURES Ph.D. Thesis
Hsin-Chia Kan 1979 344 p
Avail: Univ. Microfilms Order No. 8004724

Strips of linear 1,2-polybutadiene were cross-linked near its glass transition temperature by gamma irradiation while strained in uniaxial extension with a stretch ratio gamma sub o, with very little relaxation at gamma sub o before cross-linking. After release and warming, the sample retracts to a state of ease gamma sub s. The stress-strain relation in uniaxial extension from the state of ease is accurately represented by a two network model with cross-links and trapped entanglements; the first with neo-Hookean elasticity and the second with a Mooney-Rivlin stress-strain relation. The corresponding birefringence-strain relation is also accurately described by the two network model with respective stress-optical coefficients for the two individual networks. Dissert. Abstr.

PRELIMINARY STUDY OF METHODS FOR PROVIDING THERMAL SHOCK RESISTANCE TO PLASMA-SPRAYED CERAMIC GAS-PATH SEALS
Robert C. Bill (AVRADCOM Res. and Technol. Labs.), Donald W. Wisander, and David E. Brewe (AVRADCOM Res. and Technol. Labs.) May 1980 24 p refs
(NASA-TP-1561; E-9941; AVRADCOM-TR-79-28) Avail: NTIS HC A02/MF A01 CSCL 11G

The cyclic thermal shock resistance of several outer air, gas path seal systems for high pressure turbines was evaluated. In all these systems, plasma sprayed, yttria stabilized ZrO2 was the ceramic constituent. The most promising approaches were those that had a porous-metal, low modulus pad as a strain isolator between the ceramic layer and the dense metal substrate. Cooling pins extending into the low modulus pad significantly reduced the oxidation rate of the porous metal and the extended seal life. The thermal shock resistance of ceramic layer was improved by increasing its porosity and by precracking it before thermal shock testing. Microstructural and probe studies suggested that the long term durability of the high-pressure turbine seal systems would be adversely affected if the metal ceramic interfaces exceeded about 800 C because some metallic species would rapidly diffuse. ADJUSTABLE HIGH EMITTANCE GAP FILLER Patent Application

Howard E. Goldstein, Carlos Estrella, Marnell Smith, David A. Stewart, and Daniel B. Leiser (Stanford Univ.) Filed 7 May 1980 17 p
(NASA-Case-ARC-11310-1; US-Patent-Appl-SN-147700) Avail: NTIS HC A02/MF A01 CSCL 11G

A flexible, adjustable refractory filler is disclosed for filling gaps between ceramic tiles forming the heat shield of a space shuttle vehicle, to protect its aluminum skin during atmospheric re-entry. The easily installed and replaced filler consists essentially of a strip of ceramic cloth coated, at least along both its longitudinal edges with a room temperature vulcanizable silicone rubber compound with a high emittance colored pigment. The filler may have one or more layers as the gap width requires. Preferred materials are basket-weave aluminoborosilicate cloth, and a rubber compounded with silicon tetraboride as the emittance agent and finely divided borosilicate glass containing about 7.5% B203 as highly temperature binder. The filler cloth strip or tape is cut to proper width and length, inserted into the gap, and fastened with previously applied drops of silicone rubber adhesive. NASA

FORMATION OF POROUS SURFACE LAYERS IN REACTION BONDED SILICON NITRIDE DURING PROCESSING
N. J. Shaw and T. K. Glasgow 1979 24 p refs Presented at the Fall Meeting of the Basic Sci. and Nucl. Div. of the Am. Ceramic Soc., New Orleans, 14-17 Oct. 1979
(NASA-TM-81493; E-431) Avail: NTIS HC A02/MF A01

An effort was undertaken to determine if the formation of the generally observed layer of large porosity adjacent to the as-nitride surfaces of reaction bonded silicon nitrides could be prevented during processing. Isostatically pressed test bars were prepared from wet vibratory milled Si powder. Sintering and nitriding were each done under three different conditions:(1) bars directly exposed to the furnance atmosphere; (2) bars packed in Si powder; (3) bars packed in Si3N4 powder. Packing the bars in either Si of Si3N4 powder during sintering retarded formation of the layer of large porosity. Only packing the bars in Si prevented formation of the layer during nitridation. The strongest bars (316 MPa) were those sintered in Si and nitrided in Si3N4 despite their having a layer of large surface porosity; failure initiated at very large pores and inclusions. The alpha/beta ratio was found to be directly proportional to the oxygen content; a possible explanation for this relationship is discussed. R.C.T.

PROCESSING MECHANISMS, STRUCTURE AND MORPHOLOGY OF HIGH TEMPERATURE POLYMERIC ALLOYS, PART 2 Final Technical Report, 1 Feb. 1977 - 31 Jan. 1979
Ian L. Hay, Jay R. Shaner, Peter Sullivan, Ted T. L. Chang, and Richard R. Kemmerer Mar. 1979 64 p refs
(Contract F49620-77-C-0046; AF Proj. 2303)
(AD-A080068; AFOSR-78-0954TR-Pt-2) Avail: NTIS HC A04/MF A01 CSCL 11/9

The processing conditions expected to optimize interactions at a molecular level between poly (bisbenzimidazobenzophenanthroline) (BBB) and polybenzimidazole (PBI) have been investigated and the reaction products evolved under these conditions examined. Studies of the mechanical properties and the morphology indicate that binary interactions between BBB-BBB, PBI-PBI and BBB-PBI may all be occurring. The BBB-BBB interactions occur at temperatures greater than 500 C but PBI-PBI and BBB-PBI interactions arise at temperatures more than 100 C lower. Mass spectroscopic studies indicate that the principal reaction products in the presence of PBI are water and phenol whereas with BBB alone only water is evolved. Moreover in the mixture of BBB-PBI, phenol is evolved at lower temperatures than is the case with PBI alone. Possible end group reactions and reactions with partially cyclized rings, consistent with the observed evolution of water and phenol, are proposed for the improved processability of BBB in the presence of PBI. Further work to confirm the proposed reactions and the use of other additives to enhance these reactions is recommended. GRA

DEVELOPMENT OF HIGH TEMPERATURE SILICONE BASE FIRE-RESISTANT HYDRAULIC FLUID Final Report
Alfeo A. Conte, Jr. and J. Lee Hammond 5 Feb. 1980 75 p refs
(WF41451208)
(AD-A081597; NADC-79248-60) Avail: NTIS HC A04/MF A01 CSCL 11/8

A candidate silicone-base fire-resistant hydraulic fluid designated Nadraul MS-6 has been developed for future military aircraft hydraulic system design. The lubricating ability of this fluid has been demonstrated in hydraulic pump-loop circuit evaluations at 20.7 MPa (3000 PSI) and 55.2 MPa (8000 PSI) fluid pressures and at a fluid temperature as high as 163C (325F). Chemical and physical properties have been determined to establish both specification and hydraulic system design criteria and are reported herein. GRA

SINTERABLE POWERS FROM LASER DRIVEN REACTIONS Annual Report, 1 Jul. 1978 - 30 Jun. 1979
John S. Haggerty and W. Roger Cannon Jul. 1979 126 p refs
(Contract N00014-77-C-0581; ARPA Order 3449)
(AD-A081709; MIT-EL-79-047; AR-2) Avail: NTIS HC A07/MF A01 CSCL 11/2

Extremely fine, uniform ceramic powders were synthesized from laser heated gas phase reactions. Resulting Si, Si3N4 and SiC powders have been characterized in terms of parameters which are important for densification processes. They are virtually ideal. The spherical particles typically have mean diameters from 120 to 1000 angstrom. The standard deviation is typically 25-45% and the diameter of the largest observed particle is typically less than twice that of the smallest particle. Purities are extremely high. The laser heated process has been modeled in terms of fluid flow and heat transfer criteria. Many fundamental property measurements were made to provide data for these calculations. The process is extremely efficient; approximately 95% of the SiH4 is reacted in a single pass through the laser beam and approximately 2 kwhr. of energy are required per kilo of Si3N4. GRA

SURFACE CONTAMINATION OF ADHESIVE BONDING MATERIALS Final Report, Jan. 1978 - Sep. 1979
W. L. Baun (AFML) and J. S. Solomon Wright-Patterson AFB,

Ohio AFML Dec. 1979 57 p refs Presented at Symp. on Contamination, Washington, D.C., Sep. 1978
(Contract F33615-76-C-5185; AF Proj. 2419)
(AD-A081316; AFML-TR-79-4165) Avail: NTIS HC A04/MF A01 CSCL 11/1

The surface composition of adherend materials, as received, is usually entirely different from the bulk and generally unsuitable for adhesive bonding. Consequently, prebonding treatments of adherend surfaces are usually necessary to remove unwanted chemical species and to modify the surface chemistry and topography in order to produce a strong and durable bond. Auger electron spectroscopy, ion scattering spectroscopy, and secondary ion mass spectroscopy were used to characterize adhesive bonding materials as received and at various prebonding stages. The presence of contaminants or undesirable materials has been traced to manufacturing processes, prebonding treatments, and environment. In many instances the presence of contaminants or unwanted materials has been directly related to poor bond performance. GRA

THE ROLE OF CHEMICAL BONDING IN ADHESION Annual Report
A. N. Gent and P. Dreyfuss Feb. 1980 34 p refs
(Contract N00014-76-C-0408; NR Proj. 092-555)
(AD-A081661; TR-4) Avail: NTIS HC A03/MF A01 CSCL 13/8

Progress in three different phases of our study of the role of chemical bonding in adhesion is summarized in this report. Phase one consisted of an experimental study of the self-adhesion of thin layers of three crosslinked elastomers: namely, cispolyisoprene (natural rubber) and two polybutadienes. For the polybutadienes, the strength of self-adhesion was found to be strongly dependent upon the time of exposure of the two surfaces to air before they were brought into contact. The same phenomenon did not take place on exposure to nitrogen nor for samples of cispolyisoprene and it was reduced or delayed in samples containing antioxidant. It was therefore attributed to surface oxidation reactions that can lead to interfacial covalent bonds with polybutadiene but not with polyisoprene. Phase two consisted of a study of the effect of the number of chemical bonds at an interface between glass and polybutadiene on the joint strength of the adhesive bond formed between them. GRA

COMPARATIVE RAMAN STUDY OF MIXED-ALKALI AND SIMILAR ION EXCHANGED GLASSES
Charles Windisch and William M. Risen, Jr. 10 Dec. 1979 39 p refs Submitted for publication
(Contract N00014-75-C-0883; NR Proj. 051-539)
(AD-A080840; TR-79-02) Avail: NTIS HC A03/MF A01 CSCL 11/2

The Raman spectra of analogous ion exchanged and mixed alkali disilicate and aluminodisilicate glasses of the same relative composition of dissimilar cations have been determined and employed to investigate the origin of the similarity of the mechanical loss features exhibited by them. Ion exchange of Na- for Lin Li_2O-Al_2O_3-$2SiO_2$ glasses is shown to yield glasses whose network structure is different from that of the mixed alkali glasses of the same stoichiometry, but to attain that structure upon annealing. The network structure of ion exchanged and conventionally mixed alkali disilicate glasses are apparently identical. These results are interpreted in light of the mechanical loss spectra of the analogous glasses prepared in the two ways. GRA

STRUCTURE MODIFICATION OF FLUOROCARBON ETHER BIBENZOXAZOLE POLYMERS TO IMPROVE HYDROLYTIC STABILITY Final Report, Jun. 1975 - May 1978
R. C. Evers, G. J. Moore, and J. L. Burkett Wright-Patterson AFB, Ohio AFML Oct. 1979 37 p refs
(Contract F33615-75-C-5095; AF Proj. 2419)
(AD-A078954; AFML-TR-79-4149) Avail: NTIS HC A03/MF A01

Hydrolytically and thermooxidatively stable fluorocarbon ether bibenzoxazole (FEB) polymers were synthesized by the acetic acid-promoted polycyclocondensation of fluorocarbon ether bis (o-aminophenol) monomers with novel fluorocarbon ether dithioimidate ester monomers. The dithioimidate esters were derived from hexafluoropropylene oxide (HFPO) or, preferably, from a combination of tetrafluoroethylene oxide (TFEO) and HFPO. The latter class of TFEO:HFPO-derived dithioimidate esters was tailored to impart improved hydrolytic stability to the resultant FEB polymers while minimizing undesirable, concomitant increases in polymer glass transition temperatures (Tg). The polymers were obtained in moderate-to-high molecular weight and exhibited inherent viscosities in the range of 0.20 to 0.41 dl/g. Polymer structures were verified by elemental and infrared spectral analysis. Lower polymer Tg's were obtained with increased fluorocarbon ether content, a minimum value of -48 C (-55 F) being achieved. High thermooxidative stability of the HFPO- and TFEO:HFPO-based FEB polymers was substantiated by thermogravimetric analysis and isothermal aging studies in air. After isothermal aging in air for 200 hours at 288 C (550 F) and 260 C (500 F), respresentative polymers exhibited weight losses of 17 and 7 percent, respectively. Hydrolytic stability of the polymers was evaluated by exposure to a 95 percent relative humidity, 93 C (200 F) environment for prolonged periods of time. Based on comparative polymer Tg, inherent viscosity and infrared spectral data, the HFPO- and TFEO:HFPO-based FEB polymers exhibited vastly improved hydrolytic stability over analogous TFEO-based FEB polmers. DYNAMIC MECHANICAL MEASUREMENT OF POLYPHENYLSULFONE (RADEL) Interim Report, Jul. - Dec. 1978

C. Ying-Cheung Lee, Jacque D. Henes, and Thomas E. Grossman Wright-Patterson AFB, Ohio AFML Jun. 1979 37 p refs (Contract F33615-78-C-5126; AF Proj. 2419)
(AD-A077281; UDR-NM-TR-79-07; AFML-TR-79-4062) Avail: NTIS HC A03/MF A01 CSCL 11/9

The dynamic response of Polyphenylsulfone (Radel) was measured with the Rheometrics Mechanical Spectrometer in different modes: Torsional Bar, Tensile, 3 Point-Bending, and Parallel Plates. The measurements cover a temperature range from -150 C to 380 C. Two secondary transitions below the glass transition have been identified and their relaxation activation energies are evaluated. The region above the glass transition temperature was characterized by Parallel Plates measurement and a maximum similar to the liquid-liquid transition was observed. Viscosity in this region was also measured as a function of frequencies. A Master Curve was constructed from the Torsion and Parallel Plates data, and the frequency shift parameters were fitted to the WLF equation. GRA

SHOCK AND VIBRATION PERFORMANCE OF AN EPOXY CHOCKING COMPOUND Final Report, Oct. 1977 - Sep. 1979
E. W. Clements Dec. 1979 47 p refs
(AD-A078496; NRL-MR-4128) Avail: NTIS HC A03/MF A01 CSCL 11/9

For some years, various epoxy compounds have been used to form machinery/equipment chocks on merchant ships. In application, the item to be mounted is located and aligned, and supported in place by some temporary means while the chocking compound is mixed and poured in place. The advantages are speed, economy and intimacy of fit compared to conventional methods. More recently, these compounds have been used to a limited extent on Navy combatants, where shock and vibration environments are much more severe than those encountered in the mercantile fleet. In order to evaluate the ability of poured epoxy chocks to withstand these environments, two structures have been constructed which resemble equipment items which have been so mounted on combatants in terms of mounting footprint, weight and overturning moment. These have been subjected to shock and vibration tests similar to those required by the Navy for acceptance of shipboard equipment. The epoxy chocks were unaffected by the vibration test, while under shock test they sustained minor cracking and spalling, but without significant reduction of load-bearing area and no impairment of alignment function. It was concluded that their performance was satisfactory for the test situations employed. It should be cautioned, however, that other environmental factors (temperature, humidity, contaminants, etc.) than those considered here may also be effective, and that other mechanical situations might modify the results observed. Such factors should be evaluated for any contemplated installation. GRA

PROPELLANT SURVEILLANCE REPORT LGM-30 A AND B STAGE 1, TP-H1011
John A. Thompson Nov. 1979 110 p
(AD-A081493; MANCP-425(79)) Avail: NTIS HC A06/MF A01 CSCL 21/9

This report contains propellant test results from cartons of TP-H1011 bulk propellant representing LGM-30 A and B First Stage Minuteman Motors. Testing was accomplished in accordance with MMWRM Project M82934C-WNL17514. The purpose of testing was to determine and provide early warning of any serious degradation trends in the propellant for service life predictions. An analysis of all parameters indicates that no potential problems are expected in the propellant for at least two years past the oldest data point. Data stored in the GO85 System were plotted utilizing the IBM 360-65 Computer and CAL-COMP Plotter. The data range at any age can be found by suitable inquiry of the GO85 System. Each point on the regression plot represents the mean of all samples at that particular age. The number of specimens at each point is indicated on the sample size summary sheet accompanying each regression plot or group of regression plots. GRA

PERFORMANCE AND PROPERTIES OF EXTRUSION CAST EXPLOSIVES COMPOSED OF HMX, FEFO AND AFNOL
John S. Hallam Oct. 1979 38 p refs
(Contract W-7405-eng-48)
(UCID-18333) Avail: NTIS HC A03/MF A01

The results of a comprehensive program to develop a series of extrusion cast explosives (ECX) are developed composed of HMX and AFNOL, an energetic, cast curable binder that is plasticized with FEFO. Results indicate that an ECX can be extruded into containers of almost any configuration and then cured in place without any shrinkage or loss of homogeneity. The results also show that in the cured state ECXs are extremely insensitive to impact, and their composition can be adjusted to give different energies; a formulation containing 80 wt % HMX has the equivalent energy of PBX 9404. DOE

INITIATION OF GRANULAR EXPLOSIVES BY RAMP WAVES
R. E. Setchell 1979 22 p refs Presented at the CPIA-JANNAF Combust. Conf., Monterey, Calif., 10 Sep. 1979
(Contracts EY-76-C-04-0789; DE-AC04-76DP-00789)
(SAND-79-1169C; CONF-790975-5) Avail: NTIS HC A02/MF A01

Initiation processes in granular explosives experiencing finite-risetime loading, in contrast to shock loading were investigated. Ramp waves having a risetime or either 0.3 microseconds or 0.8 microseconds were transmitted into the explosive PBX-9404, resulting in initial waves having a peak axial stress of 5.1 GPa. The incident waves were generated in discs of a glass-ceramic, pyroceram, by planar impact of copper-faced projectiles using a gas-fired gun facility. Velocity interferometry (VISAR) was used to measure particle velocity histories after the initial wave had propagated through explosive samples having different thicknesses. For comparison, similar measurements were made for the case of shock loading to the same initial peak stress. The slower-rising ramp wave initially loads the explosive at an average rate of 7 GPa microseconds. The VISAR measurements show that initiation processes leading to detonation are strongly inhibited at such a rate of compression. DOE

METHANOL AND METHYL FUEL CATALYSTS Quarterly Report, Mar. - May 1979
Kamil Klier and Richard G. Herman Jun. 1979 14 p
(Contract ET-78-S-01-3177)
(FE-3177-3) Avail: NTIS HC A02/MF A01

Additional preparations of CuO/ZnO catalysts were made, and the materials were examined by X-ray powder diffractions. A series of cerium(IV) containing catalysts was prepared, and it was shown that the CuO/ZnO/CeO2 = 25/65/10 wt percent catalyst precursor contained the copper in the form of (Cu,Zn)2(OH)2CO3, analogous to the binary Cu/Zn = 30/70 sample. Calcination of this material, as well as of a binary ZnO/CeO2 = 87/13 sample, yielded oxides having small

crystallite sizes (< 135 A). The reduced binary Cu/Zn catalysts were examined by diffuse reflectance spectroscopy and by X-ray powder diffraction. It was observed that the amount of noncrystalline copper assayed by X-ray diffraction correlated well with that found dissolved in the zinc oxide phase by an earlier scanning transmission electron microscopy study. The relationship between the optical parameters, such as the emergence of the high intensity visible absorption and the loss of the fundamental absorption edge of the zinc oxide, and the existence of the copper-zinc oxide solid solution were established. DEVELOPMENT OF THE STEAM-IRON PROCESS FOR HYDROGEN PRODUCTION Quarterly Report, 1 Jul. - 30 Sep. 1978
Aug. 1979 95 p
(Contract EX-76-C-01-2435)
(FE-2435-39; QR-9) Avail: NTIS HC A05/MF A01

The data necessary for determining the effects of the major variables on hydrogen production in the steam-iron process were obtained. A number of significant milestones were achieved which furthered the development of the steam-iron process. A total of three highly successful hydrogen producing tests and data analysis for another test were completed. DOE

TEST AND EVALUATE THE TRI-GAS LOW-Btu COAL GASIFICATION PROCESS Quarterly Report, Apr. - Jun. 1979
Jul. 1979 38 p
(Contract ET-78-C-01-2798)
(FE-2798-66; BCR-L-1001) Avail: NTIS HC A03/MF A01

A total of three tests were conducted in the TRI-GAS PEDU. In the last two tests, the system was operated with the char and gas flows integrated in the process design mode. Smooth transfer of both char and gas between reactors was accomplished. Several minor equipment problems were encountered, but these will be alleviated through modifications. Work on the bench-scale equipment continued. DOE

CONCEPTUAL DESIGN OF A COAL-TO-METHANOL-TO-GASOLINE COMMERCIAL PLANT. VOLUME 3: ENVIRONMENTAL Interim Final Report, 31 Aug. 1977 - 1 Mar. 1979
Mar. 1979 216 p
(Contract EX-76-C-01-2416)
(FE-2416-43-Vol-3; IFR-2) Avail: NTIS HC A10/MF A01

The environmental considerations associated with an industrial manufacturing complex are addressed with specific reference to a coal-to-gasoline manufacturing facility. The environmental laws and regulations affecting the design of the coal-to-gasoline facility are summarized. Environmental control methods and equipment are outlined that will yield a zero plant discharge of all process waste water streams. Gaseous emissions are tabulated and methods of treatment and control are also described. Waste disposal by landfill methods are also considered. DOE

RESEARCH AND EVALUATION OF BIOMASS RESOURCES/CONVERSION/UTILIZATION SYSTEMS (MARKET/EXPERIMENTAL ANALYSIS FOR DEVELOPMENT OF A DATA BASE FOR A FUELS FROM BIOMASS MODEL) Quarterly Progress Report, 1 Aug. - 31 Oct. 1979
Y. K. Ahn, Y. C. Chen, H. C. Chen, E. T. Nelson, R. P. Stringer, and Richard C. Bailie 1979 35 p refs Prepared in cooperation with West Virginia Univ., Morgantown, and Environmental Energy Engineering, Inc., Morgantown, W. Va.
(Contract ET-78-C-02-5022)
(COO-5022-9) Avail: NTIS HC A03/MF A01

Biomass characterization procedures were developed to characterize approximately 100 biomass species. Thermal gravimetric analyses were supplemented with a pyrogram and a pyrochromatogram to further characterize each biomass. Tests were run on the PDU in the fluidized bed mode to determine the effects of particle size on reaction time. Thirteen tests were run during this quarter to verify the results from previous testing. The process development unit was modified to accommodate future sustained runs. A mathematical model developed by modifying the Texaco entrained bed pilot plant gasifier model to simulate biomass gasification in an entrained bed. Results were evaluated. A biomass economic program was developed to provide average product fuel costs using 15 thermochemical processes. DOE

RESEARCH AND EVALUATION OF BIOMASS RESOURCES/CONVERSION/UTILIZATION SYSTEMS (MARKET/EXPERIMENTAL ANALYSIS FOR DEVELOPMENT OF A DATA BASE FOR A FUELS FROM BIOMASS MODEL)
R. P. Stringer and R. C. Bailie 1979 17 p Prepared in cooperation with West Virginia Univ., Morgantown, and Environmental Energy Engineering, Inc., Morgantown, W. Va.
(Contract ET-78-C-02-5022)
(COO-5022-8) Avail: NTIS HC A02/MF A01

A market analysis of the need for biomass derived fuels presented and the regional availability of biomass resources on seasonal bases are discussed. Biomass conversion profiles were developed for 100 biomass materials including wood species, bagasse, sugar cane, wheat and rice straw, corn stover, and others. Conversion profiles were developed from thermal gravimetric analyses runs under various conditions of temperature and pressure and in the presence of catalysts. Gasification, pyrolysis, and direct combustion were the modes of conversion. An attempt was made to develop biomass-to-fuel process models and to verify them using process development unit runs. Finally, a linear programming model was developed for selecting the most profitable combination of feedstocks and the conversion processes required to satisfy fuels need under given market conditions. The data banks of market conditions for biomass resources and biomass derived fuels, biomass conversion profiles, and commercial scale process economics were used as input to the model. DOE

DAMPING IN STRUCTURAL JOINTS **c39**
C. F. Beards *In* Shock and Vibration Inform. Center The Shock and Vibration Digest, Vol. 11, No. 9 Sep. 1979 p 35-41 refs (For primary document see N80-23490 14-31)
Avail: NRL, code 8404. Shock and Vibration Inform. Center, Washington, D.C. 20375. Annual rate $100.00

The frictional damping mechanisms that can occur in structural joints are discussed. Linearized theories appear adequate for describing the macroslip range. Optimum joint clamping forces exist for maximum energy dissipation and for minimum structural response and have been experimentally confirmed. Fretting corrosion can be controlled by hardening joint interfaces or using EDM joints. It is suggested that some joints in any structure could allow slight slip without affecting the integrity of the structure, thereby increasing inherent damping and improving vibrational performance. BAYESIAN CONCEPTS FOR RELIABILITY AND STATISTICAL DECISION THEORY FOR STRUCTURAL DESIGN Ph.D. Thesis
Hikmat F. Mahmood 1977 163 p
Avail: Univ. Microfilms Order No. 8010799

A design procedure based on subjective analysis is developed to overcome the lack of information in the design practice. Methods of prediction are presented which are based on information collected about the specific structure to be designed or similar structures. These predictions are described by a likelihood measure. Bayes' theorem provides a formal method of revising probability measures as new information becomes available. The application of Bayesian methods to structural design problems, where there are limited experimental data, is described. Also, theoretical models are developed for structural designs based on the information available about the design variables. An a priori distribution is used to present prior knowledge or relative ignorance. Earthquake data of ground accelerations is presented and a method for predicting future earthquake accelerations is discussed as an application of this technique. Then, based on this information, a frame structure is analyzed and the probability of occurrence of such earthquakes is included. Dissert. Abstr.

N80-23494 Akron Univ., Ohio.
PROGRESSIVE SETTLEMENTS OF FOUNDATIONS ON COHESIONLESS SOILS SUBJECTED TO VERTICAL VIBRATORY LOADINGS Ph.D. Thesis
Sompetch Leelanitkul 1980 121 p
Avail: Univ. Microfilms Order No. 8010682

A governing equation was developed to relate with existing dynamic soil constitutive relationships. A method for progressive settlement analysis was then developed in which the shearing strain amplitude and number of loading cycles was related to the progressive strain. Comparisons of progressive strains observed from different types of dynamic tests at the same shearing strain amplitude show consistency of the method. The procedure and relationships can be used for predicting the progressive settlement of dynamically loaded foundations. An examination of a model test reported in the literature demonstrates the applicability of the developed method. Dissert. Abstr.

MECHANISMS TO DEPLOY THE TWO-STAGE IUS FROM THE SHUTTLE CARGO BAY **c16**
H. Theron Haynie *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 1-8 ref (For primary document see N80-23495 14-31)
(Contract F04701-78-C-0040)
Avail: NTIS HC A15/MF A01 CSCL 22B

The Inertial Upper Stage (IUS) is a two-stage or three-stage booster used to transport spacecraft from the space shuttle orbit to synchronous orbit or on an interplanetary trajectory. The mechanisms which were designed specifically to perform the two-stage IUS required functions while contained within the cargo bay of the space shuttle during the boost phase and while in a low Earth orbit are discussed. The requirements, configuration, and operation of the mechanisms are described, with particular emphasis on the tilt actuator and the mechanism for decoupling the actuators during boost to eliminate redundant load paths. R.E.S.

ORBITER DOOR CLOSURE TOOLS **c37**
William R. Acres *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 19-31 ref (For primary document see N80-23495 14-31)
Avail: NTIS HC A15/MF A01 CSCL 13I

Safe reentry of the shuttle orbiter requires that the payload bay doors be closed and securely latched. Since a malfunction in the door drive or bulkhead latch systems could make safe reentry impossible, the requirement to provide tools to manually close and secure the doors was implemented. The tools would disconnect a disabled door or latch closure system and close and secure the doors if the normal system failed. The tools required to perform these tasks have evolved into a set that consists of a tubing cutter, a winch, a latching tool, and a bolt extractor. The design, fabrication, and performance tests of each tool are described. R.E.S.

THE ACTUATED LATCH PIN AND ITS DEVELOPMENT c37
Patrick J. Lawlor *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 69-78 refs (For primary document see N80-23495 14-31)
Avail: NTIS HC A15/MF A01 CSCL 13I

An actuated latch pin developed to meet the need for a reusable locking device is described. The unit can function as a pin puller or as a pin pusher latch. Initial prototype testing demonstrated the feasibility of the device with the unit being driven from a 28 V dc supply and using 15 W to drive a 12 mm diameter pin through a stroke of 10 mm with a side load of 100 N in 120 ms. High wear rates with a MOS2 lubrication on the ballscrew and angular contact bearings have necessitated the reduction in the duty cycle from 1000 cycles in air and vacuum to 100 in air and 1000 in vacuum. M.G.

BALL BEARING VERSUS MAGNETIC BEARING REACTION AND MOMENTUM WHEELS AS MOMENTUM ACTUATORS c37
W. Auer *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 79-91 refs (For primary document see N80-23495 14-31)
Avail: NTIS HC A15/MF A01 CSCL 13I

Different bearing technologies of momentum actuators for the attitude control of satellites are compared and a guideline for the selection of the suitable momentum actuators or momentum actuator configurations to meet given mission goals with high reliability and low cost is developed. The comparison between ball bearing and magnetic bearing momentum actuators shows that given mission requirements can be economically met by employing the ball bearing technology without decreasing reliability and lifetime. However, for some special mission requirements, such as 'zero friction at zero speed,' fine pointing (met by vernier gimballing), and/or active damping, magnetic bearings may be advantageous. This makes it evident that magnetic bearing technology will not replace ball bearing technology for momentum actuators, but will supplement it for some special mission requirements. M.G.

CENTRIFUGAL REGULATOR FOR CONTROL OF DEPLOYMENT RATES OF DEPLOYABLE ELEMENTS c37
J. C. Vermalle *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 93-99 (For primary document see N80-23495 14-31)
Avail: NTIS HC A15/MF A01 CSCL 13I

The requirements, design, and performance of a centrifugal regulator aimed at limiting deployment rates of deployable elements are discussed. The overall mechanism is comprised of four distinct functional parts in a machined housing: (1) the centrifugal brake device, which checks the payout of a deployment cable; (2) the reducing gear, which produces the spin rate necesary for the braking device; (3) the payout device, which allows the unwinding of the cable; and (4) the locking device, which prevents untimely unwinding. The centrifugal regulator is set into operation by a threshold tension of the cable which unlocks the mechanism and allows unwinding. The pulley of the windout device drives the centrifugal brake with the help of the reducing gear. The centrifugal force pushes aside weights that produce friction of the studs in a cylindrical housing. The mechanism behaved well at qualification temperature and vibrations. M.G.

MECHANISMS OF UK RADIOMETERS FLOWN ON NIMBUS 5 AND 6 WITH PARTICULAR REFERENCE TO BEARINGS, PIVOTS AND LUBRICATION c37
H. Hadley *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 101-110 refs (For primary document see N80-23495 14-31)
Avail: NTIS HC A15/MF A01 CSCL 13I

The mechanisms incorporated in the vertical sounding infrared radiometry experiments which were launched on Nimbus 5 in 1972 and on Nimbus 6 in 1975 are discussed. Both use dry lubricants. The Nimbus 5 radiometer includes a rotating chopper driven via a carbon fiber-acetal resin gearwheel. The driving motor runs at 2000 rpm and has completed over 7 x 10 to the 9th power revolutions. Four gear driven filter wheels powered by stepper motors have each completed 2 x 10 to the 8th power changes. The input calibration mirror mechanism and its field of view compensation mechanisms are also described. All 25 ball races used in the experiment are of the film transfer type. The Nimbus 6 radiometer includes two cells. Each contains a piston supported on diaphragm springs and driven electromagnetically. The pistons are 6 cm in diameter with a stroke of 1 cm and are driven at their mechanical resonant frequency of approx. 15 Hz. The calibrating mirrors rotate periodically to view a target. The support pivots are synthetic sapphire ring stones with separate end thrust stones. The problems of mounting these stones to withstand vibration loads is described. M.G.

N80-23506*# National Aeronautics and Space Administration. Marshall Space Flight Center, Huntsville, Ala.
TRIPLE-AXIS COMMON-PIVOT ARM WRIST DEVICE FOR MANIPULATIVE APPLICATIONS c37
Leendert Kersten and J. Dwight Johnston *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 111-124 ref Prepared in cooperation with Nebraska Univ.-Lincoln (For primary document see N80-23495 14-31)

Avail: NTIS HC A15/MF A01 CSCL 13I

A concept in manipulator development to overcome the 'weak wrist syndrome', a triple-axis common-pivot arm wrist (TACPAW), is presented. It contains torque motors for actuation, tachometers for measuring rate, and resolvers for position measurements. Furthermore, it provides three degrees of freedom, i.e., pitch, yaw, and roll, in a single manipulator joint. The advantages of this development are increased strength, compactness, and simplification of controls. Designed to be compatible with the protoflight manipulator arm, the joints of TACPAW are back-driveable with + or - 45 deg rotation in pitch, + or - 45 deg in yaw and continuous roll in either direction while delivering 20.5 N-m (15 ft-lb) torque in each of the three movements. M.G.

EMERGENCY IN-FLIGHT EGRESS OPENING FOR GENERAL AVIATION AIRCRAFT c03

Laurence J. Bement *In its* Proc. of the 14th Aerospace Mech. Symp. May 1980 p 173-194 refs (For primary document see N80-23495 14-31)

Avail: NTIS HC A15/MF A01 CSCL 01C

An emergency in-flight egress system was installed in a light general aviation airplane. The airplane had no provision for egress on the left side. To avoid a major structural redesign for a mechanical door, an add on 11.2 kg (24.6 lb) pyrotechnic-actuated system was developed to create an opening in the existing structure. The skin of the airplane was explosively severed around the side window, across a central stringer, and down to the floor, creating an opening of approximately 76 by 76 cm. The severed panel was jettisoned at an initial velocity of approximately 13.7 m/sec. System development included a total of 68 explosive severance tests on aluminum material using small samples, small and full scale flat panel aircraft structural mockups, and an actual aircraft fuselage. These tests proved explosive sizing/severance margins, explosive initiation, explosive product containment, and system dynamics. This technology is applicable to any aircraft of similar construction. R.C.T.

N80-23512*# National Aeronautics and Space Administration. Langley Research Center, Langley Station, Va.

A SPIN-RECOVERY PARACHUTE SYSTEM FOR LIGHT GENERAL-AVIATION AIRPLANES c08

Charles F. Bradshaw *In its* Proc. of the 14th Aerospace Mech. Symp. May 1980 p 195-209 refs (For primary document see N80-23495 14-31)

Avail: NTIS HC A15/MF A01 CSCL 01C

A tail mounted spin recovery parachute system was designed and developed for use on light general aviation airplanes. The system was designed for use on typical airplane configurations, including low wing, high wing, single engine and twin engine designs. A mechanically triggered pyrotechnic slug gun is used to forcibly deploy a pilot parachute which extracts a bag that deploys a ring slot spin recovery parachute. The total system weighs 8.2 kg. System design factors included airplane wake effects on parachute deployment, prevention of premature parachute deployment, positive parachute jettison, compact size, low weight, system reliability, and pilot and ground crew safety. Extensive ground tests were conducted to qualify the system. The recovery parachute was used successfully in flight 17 times. R.C.T.

A MECHANICAL ADAPTER FOR INSTALLING MISSION EQUIPMENT ON LARGE SPACE STRUCTURES c37
A. LeFever and R. S. Totah *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 237-245 refs (For primary document see N80-23495 14-31)
Avail: NTIS HC A15/MF A01 CSCL 13I

A mechanical attachment adapter was designed, constructed, and tested. The adapter was was included in a simulation program that investigated techniques for assembling erectable structures under simulated zero-g conditions by pressure-suited subjects in a simulated EVA mode. The adapter was utilized as an interface attachment between a simulated equipment module and one node point of a tetrahedral structural cell. The mating performance of the adapter, a self-energized mechanism, was easily and quickly demonstrated and required little effort on the part of the test subjects. R.C.T.

Requirements for the space fabrication of large space structures are considered with emphasis on the design, development, manufacture, and testing of a machine which automatically produces a basic building block aluminum beam. Particular problems discussed include those associated with beam cap forming; brace storage, dispensing, and transporting; beam component fastening; and beam cut-off. Various critical process tests conducted to develop technology for a machine to produce composite beams are also discussed. A.R.H.

A lightweight extendable structure that can precisely position magnetically sensitive instruments safe distances from magnetic sources in a spacecraft is described as well as the major areas of concern that played dominant roles in its development. Weight, packaging volume, thermal distortion, mechanical misalignments, dimensional instability, launch environments, and low temperature functioning were areas that presented some formidable obstacles. The ways in which these obstacles were dealt with are examined for those involving the development of similar aerospace mechanisms with equally restrictive requirements. A.R.H.

A POLARIMETER FOR THE HIGH RESOLUTION ULTRAVIOLET SPECTROMETER/POLARIMETER c35
John A. Calvert *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 303-310 (For primary document see N80-23495 14-31)
Avail: NTIS HC A15/MF A01 CSCL 14B

The design requirements of the polarimeter were established by the scientific optical objectives of the experiment to be launched aboard the Solar Max Mission which will study active solar regions. The polarization of the light is accomplished by a rotating magnesium fluoride quarter wave plate. The quarter wave plates are rotated in 22 1/2 degree steps about an axis coincidental with the light beam. As the light beam passes through the wave plate, the transformation that occurs can be expressed by mathematical equations. By having the wave plates calibrated, the data obtained from solar flares can be analyzed and meaningful information provided to the investigators. The polarimeter has two wave plates with different optical characteristics to provide both redundancy and versatility. A four mirror polarizer was added behind one wave plate to provide additional polarization. The mechanical design, testing, and operation of the polarimeter for the high resolution ultraviolet spectrometer/polarimeter are described. A.R.H.

THE DESIGN AND APPLICATION OF AN ANTENNA POSITIONER MECHANISM FOR INTELSAT-5 SERIES COMMUNICATION SATELLITE c37
Big Szeto *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 311-322 (For primary document see N80-23495 14-31)
Avail: NTIS HC A15/MF A01 CSCL 13I

In opertion, the East/West spot beam reflectors on the Intelsat-5 series communication satellite are required to satisfy initial precise-pointing to particular Earth locations; and repositioning and pointing to different Earth locations as traffic changes dictate during the seven year mission. Two 2 axis antenna positioner mechanisms (APM) are utiltized in fulfilling these requirements. Each APM is comprised of three components which consist of one center pivot and two linear actuators rather than an integral two axis gimbal design. The step resolution of the APM can be adjusted as required with the present design, at a step resolution of 0.002865 degrees. The design philosophy and considerations, test program, and test results are discussed as well as some major problems encountered during the course of testing and their resolution. A.R.H.

THE MECHANISMS OF THE SAMS EXPERIMENT FLOWN

ON NIMBUS 7 WITH PARTICULAR REFERENCE TO THE 2 AXIS SCANNING MIRROR c37
H. Hadley *In* NASA. Langley Res. Center Proc. of the 14th Aerospace Mech. Symp. May 1980 p 323-333 refs (For primary document see N80-23495 14-31)
Avail: NTIS HC A15/MF A01 CSCL 13I

The stratospheric and mesospheric sounder (SAMS) experiment on Nimbus 7 includes a 2 axis scanning mirror and 7 pressure modulator cells. The SAMS experiment is a limb sounding instrument to measure the temperature profile and minor constituents of the atmosphere. The limb scan requires small mirror steps over a 3 deg range, while the scan in azimuth is in larger steps over a 15 deg range. The mirror is plane, 20 cm in diameter, and of zero expansion glass-ceramic. It is supported on two tilt tables, fitted one on the other, with the axes at right angles. The angle of tilt is adjusted by means of recirculating ball screws which are ion plated with lead for lubrication and driven by stepper motors. The seven gas filled cells are each pressure modulated by a 3 cm diameter, 0.3 cm stroke piston which is supported by diaphragm springs and driven electromagnetically at the system's mechanical resonant frequency. The mean pressure of the filling gas, which is the atmospheric constituent being measured, is changed by varying the temperature of a suitable molecular sieve. Author

A NEW METHOD OF ROUNDNESS MEASUREMENT BY CAPACITIVE DETECTORS Thesis - Paris VI Univ.
Bernard Foulon 1979 86 p refs In FRENCH; ENGLISH summary Report will also be announced as translation (ESA-TT-635)
(ONERA-NT-1979-9; ISSN-0078-3781) Avail: NTIS HC A05/MF A01

A high precision technique for roundness measurements of nearly cylindrical mechanical parts by the use of capacitive detectors was developed. The general problems encountered in roundness measurements and the limitations of existing systems are presented. The apparatus and test results are described. A 3 mm radius cylinder was measured with a relative accuracy of 0.0001. Theoretically the method makes it possible to determine the exact roundness of an unknown section. Author (ESA)

DUAL BAND COMBINER FOR HORN ANTENNA Patent
William F. Williams (JPL) and Seymour B. Cohn, inventors (to NASA) (JPL) Issued 22 Apr. 1980 5 p Filed 31 Jan. 1979 Supersedes N79-17068 (17 - 08, p 0968) Sponsored by NASA
(NASA-Case-NPO-14519-1; US-Patent-4,199,764; US-Patent-Appl-SN-008207; US-Patent-Class-343-786; US-Patent-Class-343-895) Avail: US Patent and Trademark Office CSCL 17B

A corrugated horn antenna, adapted to be coupled to a waveguide at its apex for X-band excitation is further adapted to be connected to waveguides through a circumferential slot for S-band excitation at four distinct phases selected for the desired S-band polarization. The circumferential slot is positioned along the axial length of the horn for good impedance matching and is provided with an X-band choke in the form of two concentric choke slots. For further improvement in impedance matching, the second (outer) choke slot is divided by plugs into four segments that coincide with waveguide ports for the four distinct phases of the S-band.

AN ANALYTICAL AND EXPERIMENTAL INVESTIGATION OF PLANAR DISCONTINUITIES IN COAXIAL WAVEGUIDES Ph.D. Thesis
Michael George Harrison 1979 233 p
Avail: Univ. Microfilms Order No. 8011143

An integral equation approach is developed for treating a large class of planar discontinuities in coaxial waveguides. The technique can effectively treat single and multiple discontinuities with no constraints on frequency or relative location. The integral equations are formulated with the transverse component of electric field in the aperture of each discontinuity as the unknown quantity. A numerical solution procedure is described which allows a choice of both the number of sub-sectional expansion pulses employed in each aperture and the number of terms evaluated in the modified higher-order-mode series. Once a solution for the electric field in each aperature is obtained, straight-forward procedures may be employed to compute the admittance of any discontinuity or the field anywhere in the wavefuige. Two sets of coaxial waveguide/cavity structures were constructed and an extensive program of experimental measurements of cavity admittance and field components at cavity wall was pursued. The measured results are compared to integral equation calculations of the same quantities to verify the accuracy of the approach. Dissert. Abstr.

ELECTROMAGNETIC PENETRATION THROUGH A SLOT IN A SCREEN COVERED BY A DIELECTRIC SLAB Ph.D. Thesis
Robert Dudley Nevels, Jr. 1979 181 p
Avail: Univ. Microfilms Order No. 8011149

The problem of scattering from a slot in a screen covered by a dielectric slab is discussed in terms of its applications in the study of electromagnetic pulse effects as well as the analysis of transmission and reception through apertures located on the surfaces of aircraft. Integral equations are derived in terms of the tangential electric field in the slot for an electromagnetic wave incident upon a simple slot, coupled slots and a notch in a ground screen covered by a dielectric slab. The method of moments is used to solve the various coupled integral equations derived. Results are presented for the electric field in a slot lying in a dielectric covered ground screen as a function of slot width and dielectric thickness. For the problem of multiple slots in a ground screen covered by a pielectric slab, results are given for the electric field in the slot as function of slot width, dielectric thickness and spacing between the slots. The electric field in the aperture of a notch in a ground screen covered by a dielectric slab is presented as a function of the width, dielectric thickness and notch depth. Other pertinent results are reported.

PROBE SIGNALING ON FADING MULTIPATH COMMUNICATION CHANNELS Ph.D. Thesis
Lawrence Elvin Hoff 1979 259 p
Avail: Univ. Microfilms Order No. 8009753

The application of forward probe signaling to unknown, randomly fading multipath communication channels is explained. The essence of the probe concept is that by dedicating part of the transmitted energy to channel probing, the receiver can measure the channel response and then construct an optimum detection scheme for the information waveform. It is shown that the detection efficiency is improved more than enough to compensate for the energy required by the probe measurements. For highly dispersed channels, the probed signaling technique

can reduce the required signal to noise ratio by 10 to 20 dB over unprobed schemes at 0.0001 bit error rate. A mathematical model of the communication problem is given. Dissert. Abstr.

N80-23529 Texas Univ. at Dallas, Richardson.
ATTENUATION OF TELESEISMIC P-WAVES WITHIN GEOTHERMAL SYSTEMS Ph.D. Thesis
Chi-Yuh Young 1979 202 p
Avail: Univ. Microfilms Order No. 8010854

A technique was developed to quantitatively construct a crystal Q model. The reduced spectral ratio method was used to compare the power density spectra of the teleseismic P-wave seismograms and calculated the lateral variation of the differential attenuation factor delta t for each station deployed across the surface of a geothermal area. These data were inverted using a generalized discrete linear inversion technique to construct a quality factor, Q, model of the crust for the geothermal system. The inaccuracies of the inversion result were due to the effect of the observational errors and necessary simplification in applying the method. An empirical relationship was determined between the error involved in the observed differential attenuation factor and the inversion results. It indicated that when the signal to error ratio is above 5, the original model is reproducible, between 5 and 1, there is a dramatic degradation of fidelity and at 1 or below, numerous low Q cells are indentified as high Q and vice versa. Dissert. Abstr.

MEASUREMENT OF INTERFERENCE-TO-NAVIGATION/COMMUNICATION AVIONICS FROM CABLE TELEVISION (CATV) SYSTEMS Final Report, Jan. - Sep. 1978
Edward M. Sawtelle and James G. Dong Dec. 1979 52 p refs
(FAA Proj. 213-662-810)
(AD-A081430; FAA-NA-79-7; FAA-RD-79-104) Avail: NTIS HC A04/MF A01 CSCL 20/14

Airborne measurements of cable television (CATV) leakage, made at selected cities to compile a representative sampling of interference effects are presented and discussed. Different altitudes were used in the flight-grid-type pattern. Ground measurements were also accomplished by the Federal Communications Commission (FCC) at the sites tested to determine any correlation between the ground and air measurements. The cities selected for discussion in this report were chosen to show various CATV effects detected by the data collection systems. A statistical analysis was performed on the data upon finding that direct airborne position correlation to strong ground leak points was not possible. The analysis provided the mean for each run of a grid and a comparison to determine if significant differences existed between runs. Where no significant differences were found, the condition was due to ambient noise exceeding signal level. Laboratory measurements were also made. Recommendations include maximum signal level for CATV leakage that may be tolerated in the communication and navigation bands. A further recommendation is made that the CATV industry use frequencies in the navigation band which are separated from Federal Aviation Administration navigation frequencies by 25 kilohertz. M.G.

A coherent scatter radar system was synthesized and several hundred hours of echo power and line of sight velocity data obtained. The coherent scatter radar utilizes a diode array and components from meteor radar. The receiving system permits a time resolution of one minute in the data. Echo power from the D region shows a high degree of variability from day to day. Examples of changes in power level at shorter time scales are observed. Velocity data show the existence of gravity waves and occasionally exhibit vertical standing wave characteristics. E.D.K.

MODIFICATION OF THE AURORA ELECTROMAGNETIC ENVIRONMENT EXPERIMENT AND INTERPRETATION Progress Report
Roland P. Manriquez, George Merkel, and Daniel J. Spohn Oct. 1979 39 p
(DNA Proj. R99-QAXEB088)
(AD-A080804; HDL-PR-79-5) Avail: NTIS HC A03/MF A01 CSCL 20/14

In a series of experiments, it has been determined that a simple parallel plate transmission line would behave in a predictable manner when subjected to the 13-MeV-thick target bremsstrahlung produced by the AURORA flash X-ray machine. During the experiment, the following parameters were measured: current into the transmission line, current through the matched termination of the transmission line, the electric field at the bottom plate along the center of the transmission line, and a component of the magnetic field at the center of the transmission line. The experimental results were interpreted with a simple lumped parameter model of the transmission line. GRA

(Contract F29601-78-C-0013; AF Proj. 3763)
(AD-A081725; AD-E200458; EG/AG-1394; AFWL-TR-79-115)
Avail: NTIS HC A06/MF A01 CSCL 20/14

This document is the final report of the E-3A EMP Evaluation

Test Program conducted for the AFWL, at Kirtland Air Force Base. The report is divided into four sections: Test Planning, Test Procedures, Data Management and Test Activities. The Test Planning section emphasizes the importance of pretest activities, demonstrates what can happen if critical items (such as connectors) are not identified early, and makes recommendations for future tests. The Test Procedures section gives a step-by-step detailed explanation for performing an EMP test on a large test object. A great number of the problems the test crew encountered on this program are pointed out and solutions are recommended. A brief discussion on power-on testing and breakout box qualification tests are included at the end of the section. The most detailed section in the report is section 4, Data Management. Virtually every function of Data Management is covered in this section; examples of typical response data, 284 calibration data, Daset log sheets and Adset log sheets are given and explained. The final section, Test Activities, explains to the reader the mechanics of performing a test at the HPD facility. GRA

CHANNELS THAT COOPERATIVELY SERVICE A DATA STREAM AND VOICE MESSAGES. 1
D. P. Gaver and P. J. Lehoczky (Carnegie-Mellon Univ.) Nov. 1979 46 p refs 2 Vol.
(Contract N00014-80-WR-00067; Grant NSF ENG-79-05526; R0000110)
(AD-A081616; NPS55-79-027-1) Avail: NTIS HC A03/MF A01 CSCL 17/2

A system of channels cooperatively services both voice and data messages arriving at one node of a communications network. This paper is devoted to the analysis of a particular channel-sharing strategy, in which voice traffic always occupies its channels when available, but data service is allowed to occur on empty voice channels. Voice traffic is taken to be of high priority; voice arrivals that find all voice channels busy are treated as losses. Note that voice traffic will be relatively infrequent as compared to data, and will also exhibit relatively long holding (service) times. Data traffic is taken to be heavy, and exhibits very short holding times (per word unit); compared to voice, data appears to arrive nearly continuously; when all data (and empty voice) channels are filled, queueing occurs. (AD-A081185; IR-3) Avail: NTIS HC A03/MF A01 CSCL 09/5

The increased leakage current in InGaAsP APDs near breakdown is found to be a rather uniform bulk property, not associated with conventional microplasmas, dislocations, or surface effects. Surface effects were eliminated by the fabrication of guard ring APDs, but the increased leakage current persisted. Surface effects were further ruled out by a statistical study of a large sample of APDs, which showed conclusively that the APD leakage current is proportional to diode area, not perimeter. Attempts to overcome the leakage current problem are still being made. GRA

THE 3-V HETEROSTRUCTURE AVALANCHE PHOTODIODE MODULES FOR FIBER OPTIC COMMUNICATION LINKS IN THE 1.0 TO 1.3 MICROMETER SPECTRAL RANGE Interim Technical Report, Aug. 1978 - Feb. 1979
R. Yeats and S. H. Chiao Apr 1979 51 p refs
(Contract DAAB07-78-C-2402)
(AD-A081747; ITR-2) Avail: NTIS HC A04/MF A01 CSCL 17/2

InGaAsP APDs have been fabricated with uniform high-speed gains up to 42 and quantum efficiencies up to 70% at 1.28 micrometers. At high gains increased leakage current leads to excessive shot noise and gain saturation. Noise measurements indicate that the increased leakage current arises from a uniformly multiplied but increasing value of the primary (i.e., premultiplication) leakage current. To try to reduce this leakage current, various procedures for fabricating guard ring APDs have been studied. Preliminary guard ring structures have demonstrated guard ring isolation by exhibiting avalanche gain in the central region only. However, these initial guard ring APDs need further development before a meaningful comparison can be made to APDs without guard rings. GRA

TEST AND EVALUATION OF MK 37 TORPEDO BATTERIES
G. J. Donaldson and William D. Barnes Dec. 1979 27 p refs
(AD-A081642; DREO-TN-79-34) Avail: NTIS HC A03/MF A01 CSCL 10/3

The exercise and warshot batteries for the MK 37 torpedo were tested against the electrical specifications of the manufacturer. Both battery types fail to meet the minimum power requirements during the three second, high rate (130A) portion of the discharge test. The warshot batteries performed as specified for the main part of the discharge test. Due to the limited number of test batteries examined it was not possible to estimate the cycle life expectancy for the rechargeable exercise battery. Electrolyte levels within some cells of the exercise battery were found to decrease over a time interval of several months. Additional

electrolyte should be provided as a routine servicing procedure. Some indication of imminent cell failure is provided by the open circuit voltage after at least a one day stand. It is indicated that low open circuit voltage may be taken as sufficient reason for the replacement of the 4 cell monoblock in the exercise battery. R.C.T.

DEVELOPMENT AND EVALUATION OF ADAPTIVE TECHNIQUES FOR REDUCING IONOSPHERIC-INDUCED RADAR TRACKING ERRORS IN REAL TIME Final Report, 1 Oct. 1978 - 30 Sep. 1979
D. E. Donatelli-DuLong 30 Sep. 1979 52 p refs
(Contract F19628-78-C-0255; AF Proj. 4643)
(AD-A081460; AFGL-TR-79-0256) Avail: NTIS HC A04/MF A01 CSCL 17/9

Adaptive procedures, using real time measurements of ionospheric parameters to reduce r.m.s. errors in predictions, are analyzed, addressing both additive and multiplicative processes as contributors to ionospheric variability. A particular procedure is tested using total electron content data from four stations at solar maximum and three stations at solar minimum. Its impact on radar, navigation and communication systems is evaluated, considering diurnal, seasonal and solar cycle effects. A space-time correlation cell is defined and cell limits established on the basis of temporal and spatial growth rate of r.m.s. residual error. Results indicate that an adapted prediction can significantly improve system performance, particularly in daytime at solar maximum when ionospheric refraction effects are most severe. GRA

A REVIEW OF REPRESENTATION FUNCTIONS FOR PROBABILITY OF DETECTION
Wayne Rivers, J. N. Bucknam, E. N. Khoury, and R. E. Blase 11 Jan. 1980 120 p refs
(Contracts N00921-79-C-A306; N00024-78-C-7065)
(AD-A081734; TSC-W25-180) Avail: NTIS HC A06/MF A01 CSCL 17/9

Simple representation functions that interrelate the primary signal detection variables for the receiver structure of Marcum and Swerling are reviewed in regard to accuracy, complexity and inversion. Functions reviewed include those of Brooks, Neuvy, and Khoury-Bucknam. The first two of these are simple algorithms for computing minimum ratio of signal energy to noise power density as functions of number of samples integrated, the target distribution case, and required probabilities of detection and false alarm. The Khoury-Bucknam functions are analytic and invertable, and they relate probability of detection and signal-to-noise ratio using parameters chosen uniquely for each case, number of samples, and probability of false alarm. The procedures and software that support determination of the coefficients of the Khoury-Bucknam function are documented. GRA

ATMOSPHERIC EFFECTS ON MILLIMETER RADIO WAVES
H. K. Kobayashi Jan. 1980 56 p refs
(DA Proj. 1L1-62111-AH-71)
(AD-A081414; ERADCOM/ASL-TR-0049) Avail: NTIS HC A04/MF A01 CSCL 20/12

This report is a short survey intended to present the atmosphere's effect on millimeter waves. The emphasis is on rain and raindrop-size distributions. This emphasis is appropriate because rain (the most common nongaseous constituent of the lower atmosphere) also has the greatest effect on millimeter waves, and raindrop-size distribution is needed to compute the theoretical and measured extinction of radio waves. The pressing need to acquire short-time data on raindrop-size distribution, particularly in the smallest size classes, is emphasized. Likewise, the acquisition of data on atmospheric fluctuations will determine how well millimeter-wave propagation through turbulence will be understood. GRA

MAXIMUM ENTROPY SPECTRAL ANALYSIS AND RADAR SIGNAL PROCESSING
R. W. Herring Jan. 1980 49 p refs Sponsored by Dept. of Natlional Defence, Ottawa
(AD-A081343; CRC-1330) Avail: NTIS HC A03/MF A01 CSCL 17/9

The theory and derivation of the maximum-entropy method of spectral analysis and the Burg algorithm, and the potential applicability of these techniques to radar signal processing, are reviewed. This material is presented in a readily comprehensible form for assessment by the practicing radar engineer. Topics such as computational complexity, statistical properties, adaptive clutter suppression and angular spectrum estimation are discussed. It is concluded that, at least at present, maximum-entropy spectral analysis is not a panacea for radar signal processing, due to its substantial computational requirements, and the relatively unknown and potentially unfavorable statistical properties of data analyzed using the Burg algorithm. A promising area of applicability appears to be that of adaptive Doppler filtering. GRA

ELECTROMAGNETIC INTERACTION OF COLLIDING BEAMS ON STORAGE RINGS
J. C. Herrera 1979 13 p ref Presented at Symp. on Nonlinear Dyn. and the Beam-Beam Interaction, Upton, N.Y., 19-21 Mar. 1979
(Contract EY-76-C-02-0016)
(BNL-27035; CONF-790318-8) Avail: NTIS HC A02/MF A01

When the beams cross each other in the intersection region of a storage ring, two distinct effects occur. A particle of one beam may undergo a fundamental interaction with a particle of the other beam. The average number of such events is equal to the product of the machine luminosity and the particle-particle total cross section. In contrast to what happens for these fundamental interactions, a particle of one beam passing through the interaction region will always be influenced by the electric and magnetic fields produced by the entire other beam. Clearly, this classical electromagnetic interaction between the two beams will perturb the motion of the particles circulating in the machine. The basic aspects of this beam-particle force are presented. The effect of this electrical force is quite different in the case of continuous (unbunched) proton beams which cross each other at the angle (as in the ISR at CERN and in ISABELLE at Brookhaven), as compared to the case of electron-positron bunches which collide head on (as in the SPEAR 2 ring and in PETRA and PEP). STUDY AND DEVELOPMENT OF A COMPUTER PROGRAM FOR ANALYSIS OF SAR PLANAR ARRAY ANTENNAS Final Report

N. C. Albertsen and P. Balling May 1979 100 p refs (Contract ESA-3693/78-NL-AK(SC))

(S-110-02; ESA-CR(P)-1297) Avail: NTIS HC A05/MF A01

The development of a computer program TOPAS for analysis of planar array antennas, in particular synthetic aperture radar (SAR) antennas, is described. The program is divided into a number of modules, each of which can be used to analyze the antenna at a certain level. It was developed on a PRIME 300 minicomputer. The first calculates the realized element excitations; taking into account mutual coupling; the second module calculates the radiation pattern, taking into account possible degradations of the array. The third module presents the data in user oriented formats such as: theta-phi plots, u-v plots, isogain curves on the ground, along track and across track curves, and integrated side-lobe level.

A STUDY OF SPECTRUM EFFICIENT MODULATION TECHNIQUES FOR DIGITAL SATELLITE COMMUNICATIONS Final Report

P. N. Sargeaunt, ed., M. J. D. Staniforth, B. G. West, G. G. Windus, J. K. Potts, R. J. Millard, and G. R. Brooks Jun. 1979 515 p refs

(Contract ESTEC-3397/77-NL-AK(SC))

(Y/212/5086; ESA-CR(P)-1298) Copyright. Avail: NTIS HC A22/MF A01

The feasibility of achieving an information rate to an occupied bandwidth ratio of 3 bits per Hz in digital satellite systems was studied as a solution to the problem of saturation of the frequency band allocated to satellite communications. Taking the 4 level PSK method as reference, multilevel phase shift keying, hybrid amplitude/phase shift keying, and partial response signaling techniques are discussed. Principles, implementation, the effect of circuit and system imperfections, are discussed, as well as compatibility with typical satellite communication applications. Satellite utilization with 16 PSK, 16 QASK, and 8 DPSK is studied, and consideration is given to the possible use of error correcting codes in signal-to-noise ratio limited situations.

PERFORMANCE OF A VERY LONG 8 GHz MICROWAVE LINK

Nov. 1979 106 p refs Sponsored in part by Electronic Systems Div., Hanscom AFB, Mass.

(PB80-129380; NTIA/REP-79/31) Avail: NTIS HC A06/MF A01 CSCL 17B

Measurement of signals received over a 160 km (100 mile) line-of-sight microwave radio link operating at 8.4 GHz is discussed. The effects of macro-scale meteorological conditions are discussed particularly those which are peculiar to the central European location of the path. The data obtained from this measurement effort are presented both in terms of radio link availability and in terms of long-term propagation performance.

The data were also analyzed to obtain distributions of fade duration for single receivers and for both receivers in a diversity configuration. It is shown that it is possible to achieve reliable propagation at 8 GHz on a link as long as 160 km and with less than normal diversity spacing. GRA

PASSIVE INTRUSION DETECTION SYSTEM Patent

Eric G. Laue, inventor (to NASA) (JPL) Issued 8 Apr. 1980 5 p Filed 9 Feb. 1977 Supersedes N77-19390 (15 - 10, p 1311) Sponsored by NASA

(NASA-Case-NPO-13804-1; US-Patent-4,197,530; US-Patent-Appl-SN-766999; US-Patent-Class-340-602; US-Patent-Class-310-319; US-Patent-Class-331-65; US-Patent-Class-340-604) Avail: US Patent and Trademark Office CSCL 09C

An intrusion detection system is described in which crystal oscillators are used to provide a frequency which varies as a function of fluctuations of a particular environmental property of the atmosphere, e.g., humidity, in the protected volume. The system is based on the discovery that the frequency of an oscillator whose crystal is humidity sensitive, varies at a frequency or rate which is within a known frequency band, due to the entry of an intruder into the protected volume. The variable frequency is converted into a voltage which is then filtered by a filtering arrangement which permits only voltage variations at frequencies within the known frequency band to activate an alarm, while inhibiting the alarm activation when the voltage frequency is below or above the known frequency band.

AN INSULATED-GATE THYRISTOR STRUCTURE: PRINCIPLES OF OPERATION AND DESIGN Ph.D. Thesis

Brad Whitney Scarf 1980 258 p

Avail: Univ. Microfilms Order No. 8011706

A thyristor configuration, developed for high power semiconductor switching functions, with a metal-oxide-semiconductor (MOS) gate that greatly reduces control-circuit power consumption, improves isolation and simplifies the interfacing of low- and high-power segments is discussed. This is not achieved by circuit techniques but by a single merged device that incorporates mechanisms found in both MCS and bipolar transistors. Although the insulated configuration is suitable for many types of thyristors and voltage and current levels, it has been repeatedly fabricated and extensively analyzed in the form of a planar 150 V bilateral switch called TRIMOS which is fully integrable and is based on a double-diffused MOS (DMOS) fabrication process. The overall current-voltage characteristics are described in terms of a simple equivalent circuit of MOS and bipolar transistors that are directly related to the physical structure. Computer analysis of the circuit leads to accurate simulation of TRIMOS characteristics in the nonregenerative region. Finally, a description of TRIMOS fabrication and design relates performance limitations to the present structure and to fundamental material properties.

TWO-DIMENSIONAL KALMAN FILTERING AND ITS APPLICATION TO IMAGE RESTORATION Ph.D. Thesis

Bindinganavle Raghavan Suresh 1979 162 p

Avail: Univ. Microfilms Order No. 8011892

The problem of image restoration was investigated. Image restoration techniques were defined in terms of their capability to mathematically model degrading phenomena and attempt to reverse the corrupting influences. An estimate of the original image was obtained through the use of a two dimensional Kalman filter. The filter was implemented by using the strip filtering technique. Strip filtering provided excellent results. Results indicate that the technique is also capable of handling nonstationary images. Dissert. Abstr.

N80-23562 Georgia Inst. of Tech., Atlanta.

DESIGN, STABILITY AND PERFORMANCE OF TWO-DIMENSIONAL RECURSIVE DIGITAL FILTERS Ph.D. Thesis

Gary Alan Shaw 1979 293 p

Avail: Univ. Microfilms Order No. 8010008

Solution methods and algorithms for problems associated with two dimensional recursive digital filter design are developed. Stability testing, stabilization, and space domain design are specifically addressed. Two aspects of recursive filter performance, their efficiency and susceptibility to instability are also investigated by means of a computer study. The major contribution in the area of stability is an efficient algorithm for testing stability of any recursive filter by phase unwrapping. The algorithm is shown to be reliable and computationally efficient. In the area of stabilization, an algorithm is proposed for stabilizing recursive filters with any type of support while approximately preserving the magnitude response. Two algorithms for space domain approximation of a desired response by a recursive filter are proposed and applied to design numerous filters. The algorithms minimize the sum-of-square error between the desired unit-pulse response and the unit-pulse response of the recursive filter over a finite area of the response plane. Performance of the two algorithms is compared. Dissert. Abstr.

DIGITAL SIMULATION OF DYNAMIC PROCESSES IN RADIOMETER SYSTEMS Contractor Report, 1 Jan. - 31 Dec. 1978

William D. Stanley May 1980 48 p refs

(Contract NAS1-14193)

(NASA-CR-159266) Avail: NTIS HC A03/MF A01 CSCL 09C

The development and application of several computer programs for simulating different classes of microwave radiometers are described. The programs are dynamic in nature, and they may be used to determine the instantaneous behavior of system variables as a function of time. Some of the programs employ random variable models in the simulations so that the statistical nature of the results may be investigated. The programs have been developed to utilize either the Continuous System Modeling Program or the Advanced Continuous System Language. The validity of most of the programs was investigated using statistical tests, and the results show excellent correlation with theoretical predictions. The programs are currently being used in the investigation of new design techniques for microwave radiometers. A.R.H.

A DYNAMIC PROGRAMMING ALGORITHM FOR PHASE ESTIMATION AND DATA DECODING ON RANDOM PHASE CHANNELS

Odile Macchi and Louis L. Sharf Dec. 1979 62 p refs

(Contract N00014-75-C-0518)

(AD-A081314; CSU-TR-DEC79-3) Avail: NTIS HC A04/MF A01 CSCL 09/4

The problem of simultaneously estimating phase and decoding data symbols from baseband data is posed. The phase sequence is assumed to be a random sequence on the circle and the symbols are assumed to be equally-likely symbols transmitted over a perfectly equalized channel. A dynamic programming algorithm (Viterbi algorithm) is derived for decoding a maximum a posteriori (MAP) phase-symbol sequence on a finite dimensional phase-symbol trellis. A new and interesting principle of optimality for simultaneously estimating phase and decoding phase-amplitude coded symbols leads to an efficient two step decoding procedure for decoding phase-symbol sequences. Simulation results for binary, 8-ARY PM, and 16-QASK symbol sets transmitted over random walk and sinusoidal jitter channels are presented, and

compared with results one may obtain with a decision-directed algorithm, or with the binary Viterbi algorithm introduced by Ungerboeck. When phase fluctuations are severe, and the symbol set is rich (as in 16-QASK), MAP phase-symbol sequence decoding on circles is superior to Ungerboeck's technique, which in turn is superior to decision-directed techniques. DESIGN OF SPECIAL-PURPOSE VLSI CHIPS: EXAMPLE AND OPINIONS Interim Report
M. J. Foster and H. T. Kung Sep. 1979 35 p refs
(Contracts N00014-76-C-0370; F33615-78-C-1551; Grant NSF MSC-78-23676)
(AD-A081451; CMU-CS-79-147) Avail: NTIS HC A03/MF A01 CSCL 09/3

This paper identifies important steps in the design of a special purpose VLSI chip, and argues that the most crucial step is the design of the underlying algorithm. Because the algorithm determines the degree of parallelism and pipelining that is possible, it largely determines the performance of the chip. Furthermore, if the underlying algorithm has the right properties such as modularity and regularity, then the rest of the design should be routine and thus takes little effort. These claims are supported by a concrete example--the design of an efficient pattern matching chip, which has been fabricated for testing. GRA

INTERFACE PROPERTIES AND SURFACE LEAKAGE OF HgCdTe PHOTODIODES Interim Report, 30 Aug. 1979 - 9 Jan. 1980
T. S. Sun, S. P. Buchner, and N. E. Byer Jan. 1980 39 p refs
(Contract DAAK70-79-C-0134)
(AD-A081530; MML-TR-80-3C) Avail: NTIS HC A03/MF A01 CSCL 09/1

A program was undertaken to determine the origin of surface leakage associated with Hg sub 1-x Cd sub x TE photodiodes and to seek improved surface passivation techniques. To attain this goal, emphasis was placed on surface spectroscopic analyses and metal-insulator-semiconductor (MIS) characteristics of candidate passivants. During the initial four months of the program, the insulating and interfacial properties of anodic oxides and ZnS on Hg0.8Cd0.2Te were investigated. X-ray photoelectron spectroscopy (XPS) techniques were developed for determining depth profiles of compositional variations in the semiconductor with a minimum materials damage. Using these techniques, we found that (a) the composition of a 1200 angstrom anodic film is 68% TeO2, 27% CdO, and 8% HgO, and (b) the cations, especially the Hg ions in the semiconductor, are significantly depleted near the interface. The capacitance-voltage curves from MIS measurements of the same specimen exhibited a large hysteresis and a characteristic indicative of a high density of surface states. The consequence of these chemical and electrical properties to diode passivation is discussed. GRA

THE PERFORMANCE OF A SAMPLED DATA DELAY LOCK LOOP IMPLEMENTED WITH A KALMAN LOOP FILTER M.S. Thesis. Interim Report, Dec. 1978 - Mar. 1979
H. S. Eilts Griffiss AFB, N.Y. RADC Jan. 1980 99 p refs
(Contract F30602-79-C-0068; AF Proj. 4519)
(AD-A081822; ESL-711679-1; RADC-TR-79-333) Avail: NTIS HC A05/MF A01 CSCL 09/5

The purpose of this study is to evaluate the steady-state and transient (lock-up) performance of a tracking loop implemented with a Kalman filter. Steady-state performance criteria are errors due to measurement noise (jitter) and Doppler errors due to motion of the tracking loop. Trade-offs exist between the two criteria such that increasing performance with respect to either one will cause performance decrease with respect to the other. It is shown that by carefully selecting filter parameters reasonable performance can be obtained for both criteria simultaneously. It is also shown that lock-up performance for the loop is acceptable when these parameters are used. GRA

The object of the program was the establishment of a production capability for surface acoustic wave devices of varied design and material for the purpose of meeting estimated military needs and to establish a base and plans which may be used to meet expanded requirements. The primary requirement was the pilot line production of devices that are reliable, reproducible, and low cost. Phase 3 involved fabrication of a large quantity of confirmatory devices which were sampled at a high rate and subjected to rigorous life and environmental testing. Phase 3 was successfully completed with delivery and acceptance of the confirmatory samples. The device configuration is detailed as it existed for Phase 3 along with assembly details, results and conclusions from the Confirmatory Sample production run. The

Fourth Engineering Phase (Phase 4) of the program was pilot line production effort of 150 each of the devices scheduled to be delivered. Solder sealing was identified as a problem area during Phase 4 for SAW devices in semiconductor pin packages. New solder seal screening and processing procedures were investigated. In addition, alternative sealing approaches were evaluated. These procedures, Tungsten Inert Gas (TIG) and projection and seam welding were demonstrated to be more compatible with SAW processing. They are especially suitable for high volume production. GRA

This report describes the advanced development of a fast warmup Tactical Miniature Crystal Oscillator (TMXO). The intended use of this TMXO is as a precision frequency/time reference in advanced communications, navigation and position location systems. The present effort is a continuation of work based on the demonstrated feasibility on previous contracts. The TMXO is an evacuated enclosure containing an evacuated inner electronics container. The electronics assembly consisting of two hybrid substances and the crystal resonator is suspended by its lead from the header of the evacuated inner container. The inner container is in turn supported by a system of Kovar wires (which also provide electrical connections) that feed through the header of the outer container. Both the inner and outer containers are hermetically sealed and the space between the containers is evacuated. Removal of the gas between the two containers eliminates heat transfer due to gas conduction and convection. This leaves only conduction through the Kovar wires and radiation as thermal coupling mechanisms between the inner container and the outer environment. GRA

MONOLITHIC INTEGRATION OF MICROWAVE GaAs POWER FETs Annual Technical Report, 1 Oct. 1978 - 30 Sep. 1978
V. Sokolov and R. E. Williams Nov. 1979 48 p refs Prepared for ONR
(Contract N00014-77-C-0657; NR Proj. 251-026)
(AD-A080793) Avail: NTIS HC A03/MF A01 CSCL 09/1

Efforts during the second year of this contract have included investigations of monolithic integration of GaAs power field effect transistors (FETs) at X-band microwave frequencies and incorporation of on-chip matching using lumped elements and coplanar ground metallization for monolithic FET circuit design. Two monolithic circuits have been investigated - a push-pull two-stage amplifier on a 2.0 x 2.0 mm chip, and a three-transistor paraphase amplifier on a 2.0 x 2.4 mm chip. Results for the two-stage push-pull amplifier include 1.4 W with 12.4 dB gain at 9.0 GHz. To provide the necessary 180 deg. out-of-phase signals for the push-pull devices, 180 deg. hybrid rings fabricated on alumina substrates are used. Fabrication of the paraphase amplifier, which is intended to replace the input 180 deg. hybrid ring, and preliminary evaluation of these chips have also been done. GRA

The ac-dc power processor type 1 power module furnishes 0-100Adc over an output voltage range of 24 to 32Vdc from a 120/208 30 50/60/400Hz power source. Remote output voltage sensing at the load circuit is provided to eliminate the IR drop of the power distribution cabling between the power module and the load. The power module can also be used for battery charging from 5 to 100A. A thyristor series LC resonant inverter power stage is used to provide the output power control and regulation, input/output ground isolation and protection of the power thyristor. The power supply is constructed in accordance with the shelter-installed, mobile GE equipment for shelter or van use without the use of fans for cooling. The internal electronics are modularized according to circuit function with provisions for easy removal and repair. GRA

DETERMINATION OF THE EFFECT OF COMPOSITION, STRUCTURE AND ELECTROCHEMICAL MASS TRANSPORT PROPERTIES ON ADHESION AND CORROSION INHIBITION OF PAINT FILMS Annual Progress Report, Oct. 1978 - Oct. 1979
Theodore R. Beck Dec. 1979 174 p refs
(Contract N00014-79-C-0021)
(AD-A080960; APR-1) Avail: NTIS HC A09/MF A01 CSCL 11/3

Seven different paint systems were formulated to meet military specifications of paints used by the Navy. These included three vinyl resins, two polyurethanes, and two epoxy resin systems. Unpigmented free films of all of these systems were prepared for various physical and chemical measurements. Chemical formulas, molecular weights, and structures of these resins are

known. Three characterization tests were used, infrared and ultraviolet spectroscopy and dynamic mechanical properties measured on a Rheovibron instrument. The loss tangent for all of the systems rapidly increased around or slightly above room temperature. The nonlinear changes in mechanical properties around and above room temperature are indicative of structural changes that would certainly influence mass transport properties of the films. GRA

TRANSDUCER ARRAYS SUITABLE FOR ACOUSTIC IMAGING Ph.D. Thesis
Charles S. DeSilets Jun. 1978 190 p refs
(Contracts N00014-75-C-0632)
(AD-A080970; GL-2833) Avail: NTIS HC A09/MF A01 CSCL 20/1

The design and development of piezoelectric transducer arrays sutiable for use in electronically scanned and focused acousitc imaging systems is described. These arrays are designed to operate in the frequency range 2-5 MHz within 45% to 80% fractional bandwidths. Linear arrays of up to 180 elements have been built and used extensively in acoustic imaging systems. Particular attention is placed on achieving high transduction efficiency and angular beam-widths of at least + or - 15 deg. Design techniques based on the tranmission line model of the transducer of Krimholtz, Leedom, and Matthaei are formulated for achieving efficient, broadband operation. These techniques involve the use of quarter-wave matching layers between a high impedance ceramic and a low impedance load. Broadband matching criteria are generated, and a novel technique for selecting the quarter-wave matching layer impedances is described. The theoretical transient response of the transducer is obtained by taking the Fourier transform of the transfer function of the transducer. An experimental transducer built using the formulated design techniques is described and its characteristics compared to theory. Slotted transducer arrays employing tall, narrow elements are described. A one dimensional model of this kind of element is formulated, and the effects of coupling between element resonant modes are examined. GRA

LOW-NOISE WIDE-BAND AMPLIFIER SYSTEM FOR STOCHASTIC BEAM COOLING EXPERIMENTS
Branko Leskovar and C. C. Lo Oct. 1979 11 p refs Presented at the IEEE Nucl. Sci. Symp., San Francisco, 17 Oct. 1979
(Contract W-7405-eng-48)
(LBL-9841; CONF-791037-15) Avail: NTIS HC A02/MF A01

A low noise wideband power amplifier system was developed for stochastic beam cooling experiments. The system incorporated a low noise preamplifier with a noise figure of 1.9 dB over a bandwidth range of 20 to 300 MHz, wideband driver and buffer stages, a frequency characteristics shaping network, a remotely controlled wideband attenuator with 0.1 dB resolution, a remotely controlled high resolution adjustable delay line, and a wideband solid state output power amplifier. The amplifier system had a maximum voltage gain of 140 dB over a bandwidth from 1.5 to 310 MHz, a signal group delay of 55.5 ns, and a c.w. output power level of 75 W. Particular attention was given to minimizing the signal propagation time delay of the amplifier system, the propagation time delay change as a function of the system gain, and harmonic and intermodulation distortion. CRITICAL COMPARISON OF HOT-WIRE ANEMOMETRY AND LASER DOPPLER VELOCIMETRY FOR I.C. ENGINE APPLICATIONS
O. P. Witze Sep. 1979 30 p refs Presented at SAE Automotive Eng. Congr., Detroit, 25 Feb. 1980 Sponsored in part by Motor Vehicle Manufacturers Association of America
(Contract EY-76-C-04-0789)
(SAND-79-8685; CONF-800202-1) Avail: NTIS HC A03/MF A01

Hot-wire anemometer and laser Doppler velocimeter measurements taken in a motored reciprocating engine are compared to access the validity of hot-wire measurements. The procedure used to account for the sensitivity of the hot wire to changes in the gas temperature is extensively investigated. For the optimum conditions of known flow direction, low turbulence level, and low compression ratio, the hot-wire anemometer can provide useful mean velocity results. Accurate hot-wire turbulence intensity measurements appear to be possible only for the intake and exhaust strokes. DOE

RESEARCH ON THE PERTINENT PARAMETERS OF A QUARTZ OSCILLATOR Thesis - Univ. Pierre et Marie Curie

Francois Tardivel 1979 131 p refs In FRENCH; ENGLISH summary Report will also be announced as translation (ESA-TT-636)
(ONERA-NT-1979-10; ISSN-0078-3781) Avail: NTIS HC A07/MF A01

A quartz operational cascade type oscillator is considered. A diode limiter device and a feed back loop made of a band filter that selects the desired quartz overtone are included. A computing method is described which allows the elaboration of a mathematical model simulating the working of the oscillator. The model accounts for a number of non linearities introduced by the transistors, the diodes, and the quartz resonator. This model permits the determination of the sensitivity to a score of parameters of the frequency of the oscillator and proves the important part played by the band filter of the feedback loop, the electric coupling of the filter, and the diode limiter device in the instability of the oscillator frequency. In order to minimize the contribution of electronics in this instability at medium and long term, a modification of the structure of the feedback loop is proposed. Author (ESA)

A SURVEY OF THE HIGH FREQUENCY EFFECTS ASSOCIATED WITH THE LIGHTNING DISCHARGE

N. S. J. Braithwaite and M. J. Cooke 1979 47 p refs
(OUEL-1290/79) Avail: NTIS HC A03/MF A01

The literature on high frequency effects associated with the lightning discharge is reviewed, with emphasis on the possible hazards to aircraft from electromagnetic fields. Sources of fast field changes in the cloud discharge and in the discharge to ground are considered in detail, from experimental observations of the far radiation field. Radiation from the return stroke and from K changes is most important up to 10 MHz, and breakdown processes become important at higher frequencies. An overall amplitude frequency spectrum is given. Models of the return stroke are briefly reviewed. Measurements at lightning current at ground are discussed, with the airborne survey of lightning fields conducted as part of TRIP-76. Author (ESA)

FIELD TESTS OF THE LIBERTY-MEAD TRANSMISSION SYSTEM

L. E. Eilts Aug. 1979 61 p refs
(PB80-125610; REC-ERC-79-9) Avail: NTIS HC A04/MF A01 CSCL 09C

Results of field tests of a 383 km (238 mi), 345 kV, series-capacitor-compensated transmission line are summarized. The test series included routine capacitor bypass and insertion tests, line switching tests, and staged fault tests. The tests demonstrated that routine capacitor bypass and insertion do not adversely affect the power system; line switching surges are modest, but reclosing, using the existing switchgear, is precluded by trapped charge; high-speed capacitor bypass was achieved but reinsertion proceeded slower than permitted by the specifications; breaker interrupting performance was acceptable; and, excepting some minor problems that were identified, the line relaying schemes generally performed satisfactorily. THE THERMAL AND HYDRODYNAMIC BEHAVIOR OF THICK, ROUGH-WALL, TURBULENT BOUNDARY LAYERS Ph.D. Thesis

Phillip Meredith Ligrani 1980 251 p
Avail: Univ. Microfilms Order No. 8011664

Thick, fully rough, and transitionally rough turbulent boundary layers were studied in order to investigate the differences between fully rough and transitionally rough behavior and to observe how downstream development affects these flows as the boundary layers become very thick. Measurements included Stanton numbers, skin friction coefficients, mean temperature and velocity profiles, Reynolds stress tensor component profiles, and spectra of the longitudinal velocity fluctuations. Predictions of wall heat transfer, wall shear, and mean profiles were made using a mixing-length and turbulent Prandtl number closure scheme which accounted for the effects of wall roughness in the boundary layer equations. Dissert. Abstr.

ON THE ORGANIZED LARGE-SCALE STRUCTURE IN A TURBULENT ROUND JET AND ITS FAR-FIELD SOUND Ph.D. Thesis

Reda Rushdi-El Mankbadi 1979 325 p
Avail: Univ. Microfilms Order No. 8007040

The large scale organized structure observed in the initial region of a round jet is investigated. Phase averaging, in addition to the usual time averaging, decomposes each flow quantity into three flow components: a mean one, a wavelike large scale structure one, and a fine grained turbulent one. After making certain assumptions concerning the shape of each flow component, the integrated energy equations are solved, yielding the wave amplitude, the fine-grained turbulence energy, and the mean flow

momentum thickness. Considering the organized structure to be more efficient than the random turbulence in emitting sound, the noise of a subsonic cold turbulent round jet is investigated. The organized structure was found to generate noise of comparable magnitude to the measured values of the full noise. The spectra of the organized structure noise were found to peak at the same Strouhal number at which the measured sound intensity peaks. The far field sound of a turbulent plane mixing layer is investigated by taking the organized fluctuations of the turbulent flow to be the dominant sound source. Lighthill's stress tensor is determined and the volume integral involved in Lighthill's equation is evaluated to yield the far field sound produced by the large scale organized structure. Results show that the organized structure radiates shear noise of considerable magnitude.

FINITE ELEMENT SIMULATION OF SIMPLE THREE-DIMENSIONAL FULLY CAVITATING FLOWS Ph.D. Thesis
Peter Yuk-Lam Ko 1980 123 p
Avail: Univ. Microfilms Order No. 8011660

A formulation is given for three dimensional fully cavitating flow with a Riabouchinsky model based on potential flow theory. The model is nonlinear and the location of the free surface of the cavity is not known priori. Therefore, an iterative procedure is used to locate the free surface boundary. The employment of a trial-free-boundary approach effectively reduces the fully nonlinear model to a linear one, and the solution at each iteration is obtained by means of the finite element method (FEM). Examples studied were fully cavitating flow past flat plates in a water tunnel. Results are given for pure drag flows past circular and elliptic plates and a lifting flow past a circular plate. Because of the change in flow boundary conditions at the separation edge and the failure of the FEM to resolve these conditions accurately, the ability of the numerical solution to maintain a constant pressure over the entire cavity decreases as the three dimensionality of the free surface increases. However, the present procedure produces absolutely stable iterations and shows no sign of drifting of the free surface. Dissert. Abstr.

N80-23595 Wayne State Univ., Detroit, Mich.
STABILITY OF MODULATED ROTATING FLUIDS Ph.D. Thesis
Jerry Ihor Tustaniwskyj 1979 183 p
Avail: Univ. Microfilms Order No. 8010180

The linear and energy stabilities of an extensively modulated cylindrical Couette flow were investigated in the finite gap range. A closed form analytic solution is obtained for the basic unsteady flow, with the modulation introduced through the boundary conditions. In the linear analysis, perturbation equations are derived and subsequently solved via the Galerkin method with the stability analyzed using the Floquet theory. Instabilities due to two dimensional axisymmetric disturbances are thoroughly investigated and results are found to compare favorably with experimental ones. Some arbitrary three dimensional non-axisymmetric disturbances are also studied and are found to be of importance especially at higher frequencies. In the energy analysis, the Euler-Lagrange equations are derived using variational techniques and are solved using the Galerkin method again. The strong energy results, where two dimensional axisymmetric disturbances are found to be the most crucial ones, are quite conservative, thus creating a rather large region where subcritical instabilities are possible. Dissert. Abstr.

N80-23596 Iowa State Univ. of Science and Technology, Ames.
THE SPLIT COEFFICIENT MATRIX METHOD FOR HYPERBOLIC SYSTEMS OF GASDYNAMIC EQUATIONS Ph.D. Thesis
Sukumar Raman Chakravarthy 1979 111 p
Avail: Univ. Microfilms Order No. 8010220

A finite difference method, the split coefficient matrix (SCM) method, for the numerical solution of hyperbolic systems of gasdynamic equations is presented. The method retains the ease of application of conventional finite difference schemes while exploiting the mathematical theory of characteristics and thus proves to be a superior method. The development of the method from characteristics theory is presented in detail. Boundary point calculation procedures along the lines of and consequently consistent with the SCM method used at interior points are explained. The split coefficient matrices that define the method are given for unsteady and steady supersonic flows, for several choices of dependent variables and for the Cartesian and cylindrical base coordinates systems. Dissert. Abstr.

N80-23597 New York Univ., N. Y.
A CLASS OF COMPRESSIBLE PARTIAL DIFFERENTIAL EQUATIONS RELATED TO THE INCOMPRESSIBLE NAVIER-STOKES EQUATION Ph.D. Thesis
John Edward Weiss 1979 189 p
Avail: Univ. Microfilms Order No. 8010412

A class of compressible extensions of the Navier Stokes equation were defined that depend on a linear operator which is required to posses a formal inverse and is otherwise arbitrary that the solutions of the compressible extension are continuous functions of a parameter and converge uniformly to the solution of the Navier Stokes equation when this parameter converges to zero. Compressible and incompressible components of the velocity field, the Markov random coupling model (MRCM) for this compressible extension was constructed to determine the quantitative nature of the interactions between the compressible and incompressible components of the velocity field. The MRCM equations were examined analytically. Results indicate that it is possible to apply closure methods with a compressible extension to study the interaction of a near incompressible flow with a compressible component. Dissert. Abstr.

N80-23598 Stanford Univ., Calif.
THE EFFECTS OF PHONON DYNAMICS ON THE SINGULAR BEHAVIOR OF A ONE-DIMENSIONAL FERMI GAS Ph.D. Thesis
Edward Hovsepian Rezayi 3 May 1980 134 p
Avail: Univ. Microfilms Order No. 8011698

Phonon dynamical effects are investigated for two model systems of fermion-phonon interactions. The first model is a Tomonaga-Luttinger model generalized to include forward scattering fermion-phonon interactions. For a certain range of the coupling constants, the model is solved exactly. The method of solution is a direct diagonalization of the Hamiltonian in the space of the Tomonaga bosons. Bosonization of Fermi fields is used to obtain the single-particle propagator, and the charge-density wave (CDW) and superconducting (SUP) response functions. A CDW occurs for regions of repulsive direct fermion-fermions interactions. The bulk of phase space for which the SUP instability occurs lies within the region of attractive fermion-fermion interactions. The second model studied is the Frohlich Hamiltonian which includes backscattering of fermions by phonons. This model is investigated by employing a low-type renormalization group. The scaling equations are obtained in the parquet (one-loop) approximation, and are found to be identical to that of the nonretarded model. The phonon dynamics, however, affect the correlation functions, which are also obtained in the parquet approximation. Dissert. Abstr.

TWO-PHASE WORKING FLUIDS FOR THE TEMPERATURE RANGE OF 50 TO 350 DEG, PHASE 2 Final Report
E. W. Saaski and J. H. Hartl Mar. 1980 57 p refs
(Contract NAS3-21202)
(NASA-CR-159847) Avail: NTIS HC A04/MF A01 CSCL 20D

Several two phase heat transfer fluids were tested in aluminum and carbon steel reflux capsules for over 25,000 hours at temperatures up to 300 C. Several fluids showed very good stability and would be useful for long duration heat transfer applications over the range 100 to 350 C. Instrumentation for the measurement of surface tension and viscosity were constructed for use with heat transfer fluids over the temperature range 0 to 300 C and with pressures from 0 to 10 atmospheres. The surface tension measuring device constructed requires less than a 1.0 cc sample and displays an accuracy of about 5 percent in preliminary tests, while the viscometer constructed for this program requires a 0.05 cc sample and shows an accuracy of about 5 percent in initial tests. ON GOERTLER INSTABILITY
Saad Aly Ragab and Ali Hasan Nayfeh Dec. 1979 81 p refs
(Contract N00014-75-C-0381)
(AD-A081255; VPI-E-79-41) Avail: NTIS HC A05/MF A01 CSCL 20/4

Goertler instability for boundary-layer flows over generally curved walls is considered. The full linearized disturbance equations are obtained in an orthogonal curvilinear coordinate system. A perturbation procedure to account for second-order effects is used to determine the effects of the displacement thickness and the variation of the streamline curvature on the neutral stability of the Blasius flow. The pressure gradient in the mean flow is accounted for by solving the non-similar boundary-layer equations. Growth rates are obtained for the actual mean flow and compared with those for the Blasius flow and the Falkner-Skan flows. The results demonstrate the strong influence of the pressure gradient and the nonsimilarity of the basic flow on the stability characteristics. GRA

APPLICATIONS OF RANDOM-CHOICE METHOD TO PROBLEMS IN SHOCK AND DETONATION-WAVE DYNAMICS Interim Report
T. Saito and I. I. Glass Oct. 1979 78 p refs
(Grant AF-AFOSR-3303-77; AF Proj. 2307)
(AD-A081304; UTIAS-240; AFOSR-80-0144TR) Avail: NTIS HC A05/MF A01 CSCL 20/4

Eight applications of the Random-Choice Method (RCM) to the solution of problems in shock and detonation-wave dynamics are presented. It is shown that unlike other numerical methods, the RCM yields sharp-fronted shocks and contact surfaces without resorting to artificial and perhaps erroneous means of predicting their locations. It has been shown by examples that the RCM provides exceptionally high computational accuracy for flows involving planar and spherical shock waves, rarefaction waves and contact surfaces, as well as their interactions. In addition, the RCM can handle flows with detonations and chemical reactions involving the above transition fronts. GRA

A HIGHER ORDER SURFACE SINGULARITY METHOD FOR THE AXISYMMETRIC INVERSE PROBLEM
J. Fernandez 25 Jun. 1979 45 p refs
(Contract N00024-79-C-6043)
(AD-A081797; ARL/PSU-TM-79-125) HC A03/MF A01 CSCL 20/4

The hydrodynamic design of the axisymmetric body with certain performance characteristics requires the solution to the inverse problem wherein the pressure distribution on the body is specified and the corresponding body profile must be determined. This paper presents an efficient inverse method for incompressible, axisymmetric potential flows employing a higher order surface singularity technique with parabolic surface elements and linearly varying sources. The body shape is obtained through an iterative scheme using the stream function to predict the body profile. The method is rapidly convergent and shows excellent agreement in cases where solutions are known. GRA

DEVELOPMENT OF PERTURBATION PROCEDURES FOR NONLINEAR INVISCID AND VISCOUS FLOWS Interim Report, 1 Apr. - 30 Sep. 1979
David Nixon Jan. 1980 105 p refs
(Contract F49620-79-C-0054; AF Proj. 2307)
(AD-A081531; NEAR-TR-214; AFOSR-80-0129TR) Avail: NTIS HC A06/MF A01 CSCL 20/4

The perturbation theory for transonic flow is further developed for two and three dimensional problems. The physical perturbation theory, in which the perturbation parameter is a physical quantity, is applied to solutions of the Navier-Stokes equations in two dimensions. The mathematical perturbation theory, in which the perturbation parameter is a measure of the difference between approximate and exact solutions, is applied both to the three dimensional potential flow problems and to the two dimensional Navier-Stokes equations. The strained coordinate technique is used to treat changes in location of any shock waves or large gradients. GRA

HYDROELASTIC OSCILLATIONS OF SMOOTH AND ROUGH CYLINDERS IN HARMONIC FLOW Ph.D. Thesis
Farhad Rajabi Dec. 1979 297 p refs
(AD-A081760) Avail: NTIS HC A13/MF A01 CSCL 20/4

A comprehensive experimental and analytical investigation has been undertaken to determine the hydroelastic response of elastically-mounted smooth and rough cylinders in harmonically-oscillating flow. The forces acting on the cylinder and the cylinder response have been measured together with the characteristics of the flow and analyzed through the use of the Fourier analysis, spectral analysis, Duhamel's integral, and the wake-oscillator model. In addition, the in-line force has been analyzed through the use of Morison's equation. The results have shown that hydroelastic oscillation occur in a narrow range of the reduced velocity and give rise to significant amplification of the exciting force. The use of the Fourier and spectral analysis together with the governing equations of motion was shown to predict the hydroelastic response of the cylinders in the synchronous region. The investigation shed considerable light on the interaction between the harmonic fluid motion and the hydroelastic response of cylinders and provided definitive information for the prediction of the force and response characteristics of the type of oscillations considered herein. ON THE INTERACTION OF WALL JETS AND FOUNTAIN FORMATION Final Report
K. T. Yen 30 Sep. 1979 25 p refs
(AD-A081540; NADC-79275-60) Avail: NTIS HC A02/MF A01 CSCL 20/4

An analysis of the fountain formation produced by the vertical impingement of two jets on a flat-ground surface is presented. A method has been developed for the determination of the upwash angle of the fountain in the plans of symmetry and the ground stagnation line. Comparison of the calculated results from the present analysis with tests data obtained by the Grumman Aerospace Corporation shows generally good agreement. The different methods of approach and results in some recent works

regarding the upwash angle are discussed, and it is shown that the fountain should leave the ground surface in direction perpendicular to it, and approach the upwash angle asymptotically. GRA

PREDICTION OF SEPARATING TURBULENT BOUNDARY LAYERS INCLUDING REGIONS OF REVERSED FLOW Final Report

R. H. Pletcher, O. K. Kwon, and R. Chilukuri Feb. 1980 71 p refs

(Grant DAAG29-76-G-0155)

(AD-A081592; ISU-ERI-AMES-80112; HTL-22; ARO-13376.4-E) Avail: NTIS HC A04/MF A01 CSCL 20/4

The results of a research program to develop and evaluate improved prediction methods for turbulent separating flows are summarized. The predictions of several turbulence models have been compared with experimental data for flows containing regions of recirculation using an inverse finite-difference method to solve the boundary layer equations. A new turbulence model which employs a one-dimensional transport equation for the outer-layer length scale was seen to provide the best agreement with the experimental data beyond separation. A viscous-inviscid interaction calculation procedure was developed to predict airfoil flows containing leading edge or midchord separation bubbles. The procedure utilized the inverse finite-difference method to predict the viscous flow and a small disturbance Cauchy integral formulation for the inviscid flow. Three models for laminar-turbulent transition were evaluated. Generally good agreement between predictions of the best model and measurements was observed in the several comparisons made. Some early results from a finite-difference scheme to solve the partially parabolized Navier-Stokes equations in primitive variables were also reported. The method was developed to predict viscous flows in which normal pressure gradients cannot be neglected. GRA

A CALCULATION METHOD FOR CONVECTIVE HEAT AND MASS TRANSFER IN MULTIPLY-SLOTTED FILM-COOLING APPLICATIONS

S. B. Murray Jan. 1980 91 p refs

(AD-A081641; DRES-TP-507) Avail: NTIS HC A05/MF A01 CSCL 20/4

A computer model to calculate the development of wall jet boundary layers downstream of multiple film-cooling slots is described. The differential equations for the conservation of mass, momentum and energy in an incompressible two-dimensional for axisymmetric flow are solved using a downstream-marching, iterative, implicit, finite-difference scheme. The turbulent transport of mass in a conventional wall boundary layer is described by means of inner outer two layer eddy viscosity model based on the Prandtl mixing-length hypothesis with Van Driest's modification in the near-wall region. Further alterations to include the effects of pressure gradients, heat and mass transfer are due to Cebeci and Smith. This basic model is extended to include cases with tangential fluid injection. Computed velocity profiles indicate that the law of the wall is obeyed in the inner layer and that the outer wake-like layer strives to resume the velocity-defect relationship that existed upstream of the point of fluid injection in zero pressure-gradient flow with no heat or mass transfer. Comparison between computed and experimental adiabatic wall temperature distributions in flows with heat transfer shows that the eddy viscosity model is deficient in the near-slot region and tends to overestimate film-cooling efficiency. The absence of an eddy term to account for turbulence due to finite slot lip thickness is partly responsible for this overestimation. Recommendations are made to validate the model in pressure-gradient flows and to improve the predictive capability in the near-slot region. GRA

COMPUTER PROGRAMS FOR CALCULATING PARTIALLY CAVITATING BLUNT TRAILING EDGED CASCADE FLOWS IN NONLINEAR THEORY Technical Manual, 15 Feb. - 31 Oct. 1979

Shin Maekawa and Okitsugu Furuya Jan. 1980 207 p

(Contract N00014-79-C-0234)

(AD-A081832; TETRAT-TC-3284-02) Avail: NTIS HC A10/MF A01 CSCL 09/2

In addition to the previously developed partially cavitating cascade theory, two new flow models were constructed in search of a better flow model for determining accurate force coefficients. Effort has been made for obtaining (1) physically acceptable flows, particularly the location of cavity boundary and (2) smooth matching of the flow characteristics between the partially cavitating and super-cavitating flow regimes. Based on the numerical results made with these flow models for practical blade profiles taken after a supercavitating propeller, it was found that no single flow model developed could handle the complete set of cascade geometries and incidence angles. One theory was supplemental to the other and no definite guideline was discovered for selection of an appropriate flow model for a specified flow condition to be solved except for a few weak evidences. This report is a users' manual for the computer programs developed above, describing the structure of program, input data set-up, typical output data and listing. GRA

LAMINAR FLOW CYCLONE DEVELOPMENT PROGRAM Quarterly Technical Progress Report, 1 Oct. - 31 Dec. 1978

W. B. Giles and K. L. Bekofske Jan. 1979 9 p

(Contract ET-78-C-01-3242)

(FE-3242-2) Avail: NTIS HC A02/MF A01

The deleterious effects of turbulent mixing in the cyclone separation process were investigated. Transition from laminar to turbulent flow can be delayed to higher velocities and large scale by suppressing inlet turbulence and preventing boundary layer tripping. Extended laminarization can be obtained by techniques such as wall suction and wall cooling (in the case of gaseous flows). In cyclone separators, the flow must be set into a swirling motion to provide the separative g-field. The implications are that the flow entering the cyclone is unstable and that the swirl vane wake turbulence is the most probable trigger. The design of a model with greater contraction to suppress vane wake turbulence and a shorter radial inflow region to inhibit the development of the wall jet is proposed. An analysis of the boundary layer situation is suggested. DOE

DEVELOPMENT OF THREE-DIMENSIONAL TURBULENT BOUNDARY LAYERS IN INCOMPRESSIBLE FLOW WITH SEPARATION B.S. Thesis
M. I. Nissiriou and N. Pilatis Jun. 1979 58 p refs
(BU-239) Avail: NTIS HC A04/MF A01

The development of a three dimensional turbulent boundary layer was investigated in a non symmetrical diffuser. A yawmeter was calibrated and used to measure total pressures and angles of yaw over the twisted floor of the diffuser. Longitudinal pressure distributions, velocity profiles and viscous layer parameters were analyzed and compared with the results of an earlier two dimensional experiment. Lateral variables and parameters are presented and discussed. A swept separation front was defined and the flow beyond it is described. The establishment of equilibrium profiles in various parts of the flow is shown. Author (ESA)

JET INJECTIONS FOR OPTIMUM MIXING IN PIPE FLOW Final Research Report
S. D. Fitzgerald and E. R. Holley Dec. 1979 97 p refs
Prepared for the Office of Water Research and Technol., Washington, D.C.
(PB80-128960; UILU-WRC-79-0144; W80-02470; OWRT-A-091-ILL(1)) Avail: NTIS HC A05/MF A01 CSCL 20D

Laboratory experiments were conducted to determine the rates of mixing with a single jet injection made at the pipe wall at various angles relative to the pipe wall and with two diametrically opposed jets. For uniform pipe flow, it was possible to identify an optimum momentum for each angle of injection. A few experiments with induced swirl in the pipe flow showed that the swirl had a significant effect on the jet mixing, especially when two jets were used. GRA

CRYOGENIC COOLING STUDY FOR THE ADVANCED LIMB SCANNER
S. C. Russo May 1980 110 p
(Contract NAS1-16029)
(NASA-CR-159250) Avail: NTIS HC A06/MF A01 CSCL 14B

The cryogenic operating requirements for a VM refrigerator to be used for detector cooling of the advanced limb scanner (ALS) instrument are defined. Determination of these requirements include consideration of mission and environmental constraints. Based on the operating requirements a detailed refrigerator design and performance analysis is conducted resulting in an optimized VM refrigerator conceptual design. The cooler-instrument-

spacecraft interfaces are evaluated resulting in recommendations as to the best approach and most effective concepts resulting in simple and satisfactory interfaces. A preliminary implementation plan and schedule describing the general tasks required to develop, design, manufacture, test, and deliver three VM coolers and required support equipment to support an ALS flight experiment are presented. The result of this effort shows that existing VM cooler technology is sufficient to satisfy ALS mission requirements and schedules. M.G.

(UCRL-83317; CONF-790887-1) Avail: NTIS
HC A02/MF A01

The performance goals, design considerations and physical details of the miniature infrared absorption sensor developed for the liquefied natural gas spill safety program are presented. The sensor is lightweight, battery-powered, portable, self-contained, and able to interface readily to large array data systems. Essentially a precision infrared differential spectrometer capable of operating over the full range of gas concentrations expected in the spill diffusion tests, the sensor is expected to cost less than $7000 per unit. The present design of this open-cell fast response sensor

allows it to measure two components, but it can be modified to measure additional components at a reduced sampling frequency. To minimize temperature effects and power consumption, the sensor has a single source, single detectors design which includes a rotating chopper-filter wheel. A CMOS microprocessor interfaced with a arithmetic chip is used to linearize sensor output and correct for component interference. DOE

(ORNL/TM-7025) Avail: NTIS HC A04/MF A01

Long term stability tests for systematic drift and strain sensitivity (gage factor) were conducted on two types of capacitive strain (gage) - the Boeing differential-capacitance gage and the CERL-Planer variable gap capacitive strain transducer and on the Ailtech SG-425 resistance gage. Results for tests of durations up to 12,000 hr are presented and compared with similar tests reported by others. The stability and repeatability of the capacitive systems were verified. In addition, two short term investigations were made on Ailtech weldable-resistance gages to address areas of uncertainty related to special applications. Data from these tests are also presented and interpreted. Advantages and limitations of the various systems are identified, and conclusions and recommendations are presented. Descriptions of the gage systems and problems encountered in the use of capacitive gages are given. DOE

A SIMPLE CAMERA SYSTEM FOR PHOTOGRAPHY OF PROJECTILES IN FLIGHT UNDER DAYLIGHT CONDITIONS
A. W. M. vanderVoort Nov. 1978 97 p refs In DUTCH; ENGLISH summary
(PHL-1978-51; TDCK-71693) Avail: NTIS HC A05/MF A01

A modified Linhof camera with a two msec electromechanical shutter using a point light source with a flash interval of one microsecond was developed. Photography of projectiles in flight with a length of up to one meter and a velocity up to 1700 meters per second is possible. A retro reflector and high gain reflective sheeting were used. Silhouette and shockwave photographs are also possible. The use of a second flash unit permits photographs of the projectile body. Author (ESA)

GYRO NOISE MEASUREMENT AND ANALYSIS
J. A. Bosgra, J. J. M. Reumers, A. D. King (Ferranti Ltd., Edinburgh), G. Dickson (Ferranti Ltd., Edinburgh), and G. S. Gordon (Ferranti Ltd., Edinburgh) 12 Sep. 1979 177 p refs
(Contract ESA-3423)
(NLR-TR-79077-U; ESA-CR(P)-1295) Avail: NTIS HC A09/MF A01

Noise measurements were performed on two identical space qualified gyroscopes of the floated rate integrating type (Ferranti Type 125) in an analog rebalance loop configuration of selectable loop bandwidth, running under space representative conditions. The noise frequency range of interest was 0.005 Hz to 50 Hz. The noise results were processed into a number of statistical parameters (mean, standard deviation, range, slope, histogram). In addition, through a fast Fourier transform, auto and cross power spectra were determined together with auto and cross covariance functions. By making use of transfer function polynomials, equivalent gyro open-loop power spectra were computed from the closed-loop results and compared with directly measured open-loop spectra. A selection of the results is presented as graphs. Author (ESA)

LASER ANNEALING OF GaAs Final Technical Report, 5 Jan. 1978 - 30 Sep. 1979
F. H. Eisen, J. L. Tandon, and C. G. Kirkpatrick Jan. 1980 58 p refs
(Contracts MDA903-78-C-0285; MDA903-78-C-0463; ARPA Order 3595)
(AD-A081466; ERC-41008.11FR) Avail: NTIS HC A04/MF A01 CSCL 20/5

Irradiations of appropriate energy densities from a pulsed ruby laser lambda = 0.69 microns, tp approx. 15 or 59 ns) or

a pulsed electron beam (energy approx. 20 keV, t(p) approx. 100 ns) were found to anneal implanted amorphous layers in GaAs successfully without using an encapsulant. This was confirmed by backscattering/channeling and TEM measurements. Good electrical activation of high dose (greater than 10 to the 15th power sq. cm) implanted donor ions, with peak electron concentrations higher than 10 to the 19th power cc, was achieved after both pulsed ruby laser and pulsed electron beam irradiations. Low dose (less than 10 to the 13th power sq. cm) donor ion implanted samples irradiated with ruby laser or electron beam pulses did not show any measurable electrical activity. Possible reasons for this apparent inactivity were explored but the exact reasons are not clear at present. Au-Ge/Pt ohmic contacts with specific contact resistance as low as 10 to the -7th power omega/sq.cm were fabricated on n-type GaAs by pulsed electron beam alloying. This value of the specific contact resistance is one of the lowest values reported so far. GRA

INDUCED EVAPORATION OF METAL FROM AN ALUMINUM SURFACE BY A NORMAL PULSE NEODYMIUM LASER M.S. Thesis
Christopher Brinton Johnson Sep. 1979 77 p refs
(AD-A081601) Avail: NTIS HC A05/MF A01 CSCL 20/5

Laser induced evaporation of material from the surface of an aluminum target in a vacuum was studied. Based on a literature examination, material removal using a normal pulse laser was judged to be more efficient than for a Q-switched laser. The experiment was conducted using a neodymium glass laser modified for normal pulse operation. The energy density was varied from 850 J/sq cm where no breakdown occurred to 5000 J/sq.cm where the threshold for breakdown was exceeded. The normal pulse duration was 600 microsec. Analysis of the ejected material was achieved by using a Hughes Ionization Gauge placed in the path of the ejected material. Oscilloscope traces of the ionization gauge output show that the gauge 'sees' what is flying past it. There is good correlation between laser radiation, plasma radiation and ionization gauge fluctuations. The ionization gauge gave distinguishable signals for ions, electrons, and neutral particles ejected from the target surface. Signal sequence was dependent on the particle velocity. By measuring the elapsed time after ejection from the surface and the target to collector distance, the first arriving neutral particle velocity was determined to be 5.2 times ten to the 4th power cm/s. GRA

INVESTIGATION OF VELOCITY FIELD ABOUT A TWO DIMENSIONAL PLEXIGLASS OGIVAL FOIL USING THE LASER DOPPLER ANEMOMETER M.S. Thesis
Gary J. Tettelbach Jun. 1978 135 p refs
(AD-A081765) Avail: NTIS HC A07/MF A01 CSCL 20/4

Until recently measuring the velocity of a fluid required the insertion of some instrument into the flow which would disturb the flow. The development of the laser doppler anemometer has created a means of measuring flow velocity using two intersecting monochromatic light beams, one of which has been shifted in frequency a prescribed amount. In order to use the type of laser doppler anemometer owned by M.I.T. the light beams must be able to traverse the test section and the scattered light be collected by the receiving optics. This requires a transparent model in order to measure the flow around the entire model. This thesis demonstrates the feasibility of such a method and is an account of the special techniques used to obtain the data. GRA

MEDIUM EFFECTS OF FLUORESCENCE QUANTUM YIELDS AND LIFETIMES FOR COUMARIN LASER DYES Technical Report, 1 Nov. 1978 - 31 Oct. 1979
Guilford Jones, II, William R. Jackson, and Arthur M. Halpern (Northeastern Univ.) 1 Jan. 1980 13 p refs Submitted for publication
(Contract N00014-79-C-0054; NR Proj. 395-609)
(AD-A081748; TR-1) Avail: NTIS HC A02/MF A01 CSCL 07/4

Fluorescence quantum yields and lifetimes for a series of aminocoumarin laser dyes have been measured. The characteristics red shift of fluorescence in polar solvents is accompanied by a marked decrease in emission yield and lifetime for coumarins in which the substituted amine group at the 7 position is free to rotate. Strong emission is maintained in structurally rigid dyes. The non-radiative decay rates for non-rigid dyes which increase in polar solvents are associated with relaxation of emissive planar dye conformations to twisted zwitterionic species. GRA

SOLVENT EFFECTS ON PHOTOPHYSICAL PARAMETERS FOR COUMARIN LASER DYES Technical Report, 1 Nov. 1978 - 31 Oct. 1979
Guilford Jones, II, William R. Jackson, Santhi Kanoktanaporn, and Arthur M. Halpern (Northeastern Univ.) 1 Jan. 1980 20 p refs Submitted for publication
(Contract N00014-79-C-0054; NR Proj. 395-609)
(AD-A081749; TR-2) Avail: NTIS HC A02/MF A01 CSCL 07/4

The red shifts of absorption and emission bands of coumarin laser dyes were studied as a function of solvent polarity and hydrogen bonding. Spectra were correlated with solvent parameters, pi and alpha, and those solvents resulting in the largest Stokes shifts of dye emission were identified. Solvent effects on emission yield and lifetime revealed a major non-radiative decay path for dyes in which the 7 amine function is free to adopt a non-planar conformation. GRA

DESIGN CONSIDERATIONS OF A FLOW SYSTEM FOR TRANSIENT LASER DISCHARGE EXPERIMENTS
Josef Stricker Aug. 1979 37 p refs
(RR0000101)
(AD-A080942; NPS67-79-008) Avail: NTIS HC A03/MF A01 CSCL 20/5

Design considerations were examined for a flow system for transient electrical laser experiments. After a brief review of corona discharge gas flow interaction phenomena, the choice of the size and operating conditions of the discharge cell are discussed. Once those parameters are established, the flow system, which consists essentially of a Ludwieg tube, is designed. Attention is paid to flow starting times, to the available time of steady state flow, and to the effects of the boundary layer on the core flow. Suggested experiments and instrumentation are given in this report. GRA

PROGRAM TO INVESTIGATE ADVANCED LASER PROCESSING OF MATERIALS Annual Report, 1 Jun. 1978 - 31 Jul. 1978
E. M. Breinan, C. O. Brown, and D. B. Snow Aug. 1979 93 p refs
(Contract N00014-78-C-0387; ARPA Order 3542)
(AD-A077573; UTRC/R79-914346-4; AR-1) Avail: NTIS HC A05/MF A01 CSCL 20/5

During the course of the initial program year, UTRC's program to produce and spin test a 12.7 cm diameter turbine disk using the LAYERGLAZE (TM) process fabrication technique has seen major milestones met in both the processing and alloy Design areas. Specifically, in the processing area, a powder feed LAYERGLAZE apparatus has been designed, constructed, and used to produce LAYERGLAZE parts for mechanical test, and a 13.2 cm diameter, 3 cm thick scale model disk preform. Mechanical testing and microstructural analysis showed the LAYERGLAZED material to have excellent microstructure, along with good structural integrity and freedom from serious fabrication flaws. It thus appears that the process and the apparatus will be capable of producing test disks which will meet the program's major objective of a spin test in late 1980. In the alloy design area, a technique for effective, rapid screening of alloys for LAYERGLAZE fabricability has been devised. Early experience showed that all but the weakest of conventional superalloys crack under LAYERGLAZE fabrication conditions. Therefore, the alloy development task assumed the challenging role of identifying strong ductile alloys which are also fabricable by the LAYERGLAZE process. To date, a preliminary series of alloys based on the Ni-Al-Mo system has been identified, and one composition, Ni-8Al-12Mo-3Ta (at %) has been LAYERGLAZE fabricated and mechanically tested. GRA

INTRACAVITY ABSORBER EFFECTS IN A CW DYE LASER Progress Report, 1 Jun. 1978 - 31 May 1979
G. O. Brink Feb. 1979 8 p refs
(Contract EG-77-S-02-4448)
(COO-4448-2) Avail: NTIS HC A02/MF A01

The technique of dye laser intracavity absorption was studied as a possible method of detecting small densities of atoms and molecules in combustion systems. Two types of phenomena were observed. Absorption signals, which, although of complex line shape, result in a decrease in laser intensity at the absorption wavelength are observed over a wide range of absorber densities. At values of the pump laser power above a certain threshold an enhancement effect is observed in which the dye laser spectrally condenses at the absorber wavelength. The enhancement effect allows the detection of very low densities of sodium with good signal to noise ratio. The data obtained to date are discussed. DOE

MECHANICAL DESIGN FOR A LARGE FUSION LASER SYSTEM
C. A. Hurley 1 Nov. 1979 14 p refs Presented at the 8th Symp. on Eng. Probl. of Fusion Res., San Francisco, 13 Nov. 1979
(Contract W-7405-eng-48)
(UCRL-82928; CONF-791102-11) Avail: NTIS HC A02/MF A01

Progress is reported in the design, fabrication, and installation of laser chain components, the stable support structure that holds them, and the beam lines that transport the laser beam to the target system. Topics covered relating to the Nova laser system include configuration, spaceframe, beam line components, amplifiers, spatial filters, and cleanliness of the glass, mirrors and other surfaces. DOE

N80-23649# California Univ., Livermore. Lawrence Livermore Lab.
LASER-DRIVEN SHOCKWAVE EXPERIMENTS AT EXTREME HIGH PRESSURES
R. M. More 21 Sep. 1979 29 p refs Presented at the 5th Workshop on Laser Interactions with Matter, Rochester, N.Y., Nov. 1979
(Contract W-7405-eng-48)
(UCRL-83372) Avail: NTIS HC A03/MF A01

A quantitative analysis of the prospects for using laser-driven shockwave experiments to accurately determine equation of state data in the multimegabar pressure range is presented. In order to unambiguously interpret shockwave data, that is, a planar, steady shock wave entering cold material (without significant preheat perturbation) is required. The problems of attaining sufficiently clean shocks at high pressure are examined and scaling relations which relate the pressure achieved to laser intensity, pulse energy, etc. are developed. It is shown that significantly higher pressures can be achieved when structured (layered) targets are used. DOE

N80-23650# Sandia Labs., Albuquerque, N. Mex.
DEVELOPMENT OF A LASER INTERFEROMETRIC DILATOMETER
W. D. Drotning 1979 32 p refs Presented at the 16th Intern. Thermal Conductivity Conf., Chicago, 7 Nov. 1979
(Contracts EY-76-C-04-0789; DE-AC04-76DP-00789)
(SAND-79-1714C; CONF-791134-6) Avail: NTIS HC A03/MF A01

The development of a high precision dilatometer using laser interferometry is described. Design criteria require operation over a temperature range from ambient to 900 K with a length change sensitivity of ten microinches (0.25 microns) or less. The dilatometer is designed to achieve rapid sample turnaround for quality control measurements in a production environment. The length change measurement is based on a modified Michelson interferometer using a two-frequency HeNe laser and ac detection of fringes. The final critical alignment of the interferometer during sample installation is achieved by automatic computer control. The furnance system incorporates a low thermal mass heating chamber to achieve rapid thermal response with minimal thermal disturbance to the interferometer system. Flexibility and reproductivity in heating schedules are achieved through digital control. Dilatometer control and data acquisition functions are accomplished by a minicomputer using a standard interface bus. DOE

DIRECT SOLAR PUMPED LASER
Howard C. Volkin Jul. 1979 33 p refs
(Contract W-7405-eng-36)
(LA-7982-MS) Avail: NTIS HC A03/MF A01

The development of a direct solar pumped laser is described. Laser operation on the phosphorescence transition T reacts with S, with a suitable dye/solvent system is described. The set of coupled rate equations that governs the solar pumping kinetics are formulated. The compatability of the laser system with useful CW laser operation is discussed. DOE

N80-23652# Bureau of Radiological Health, Rockville, Md.
ANALYSIS OF SOME LASER LIGHT SHOW EFFECTS FOR CLASSIFICATION PURPOSES Final Report, Nov. 1979
David D. Royston Nov. 1979 25 p refs
(PB80-131576; FDA-80-8103; FDA/BRH-80/35) Avail: NTIS HC A02/MF A01 CSCL 20F

Some laser effects in laser lights shows irradiate audiences directly with laser radiation. This laser radiation must be below class 1 accessible emission limits. If actual radiometric measurements cannot be performed, a numerical analysis of the laser effect can be made to determine if the accessible laser

radiation is below acceptable limits. An analysis is presented of the following laser light show effects: a sawtooth wave scan, a triangular wave scan, a sine wave scan, a circular Lissalous pattern, a stationary laser beam on a rotating mirror ball, and a scanning laser beam on a mirror ball. The level of laser radiation of the effect is computed as well as the length of time the effect remains below class 1 levels. GRA

FLOATING NUT RETENTION SYSTEM Patent
James F. Charles (Rockwell International Corp., Downey, Calif.) and Harry A. Theakston, inventors (to NASA) (Rockwell International Corp., Downey, Calif.) Issued 18 Mar. 1980 5 p Filed 31 Aug. 1978 Supersedes N78-32931 (16 - 23, p 3085) Sponsored by NASA
(NASA-Case-MSC-16938-1; US-Patent-4,193,435; US-Patent-Appl-SN-938582; US-Patent-Class-151-41.76) Avail: US Patent and Trademark Office CSCL 13I

A floating nut retention system includes a nut with a central aperture. An inner retainer plate has an opening which is fixedly aligned with the nut aperture. An outer retainer member is formed of a base plate having an opening and a surface adjacent to a surface of the inner retainer plate. The outer retainer member includes a securing mechanism for retaining the inner retainer plate adjacent to the outer retainer member. The securing mechanism enables the inner retainer plate to float with respect to the outer retainer number, while simultaneously forming a bearing surface for inner retainer plate.

EVALUATION OF THE TRACTION CHARACTERISTICS OF THREE LUBRICANTS Final Report, 1 Jan. - 31 Dec. 1978
C. J. Montrose, R. Moeller, D. Czaplak, B. Houston, R. R. Meiste, and P. Schoen (NRL, Washington, D.C.) Wright-Patterson AFB, Ohio AFML Mar. 1979 35 p refs
(Contract N00014-75-C-0585; AF Proj. 2421)
(AD-A080968; AFML-TR-79-4055) Avail: NTIS HC A03/MF A01 CSCL 11B

A combination of experimental techniques is used to characterize the viscoelastic properties of three lubricant candidates. These data were used as inputs in a model calculation to evaluate the traction characteristics of the candidate fluids for application to rolling element bearing analysis. All are found to have lower traction coefficients than the best traction fluids currently available. The major cause of this stems from the relatively slow variation of the shear viscosity with pressure in all three fluids and in one case a rather broad relaxation time spectrum. The other viscoelastic factors that are important in determining traction are found to be in a quite normal range. GRA

EVALUATION OF BASIC LASER WELDING CAPABILITIES Final Report, 1 Jun. 1974 - 31 May 1979
D. B. Snow, M. J. Kaufman, C. M. Banas, and E. M. Breinan Jul. 1979 44 p refs
(Contract N00014-74-C-0423)
(AD-A077575; UTRC/R79-911989-17) Avail: NTIS HC A03/MF A01 CSCL 20/5

5456 and 5086 aluminum alloys were welded with a continuous, cross-beam CO2 laser operated in the master oscillator/power amplifier mode (Gaussian beam). Extensive experimental parameter modifications were made to the welding apparatus in an attempt to improve weld quality, in particular the reproducibility and uniformity of fusion zone penetration. The effects of laser (power, mode, optics), process (welding speed, beam rotation, shielding design) and other (weld prep, wire feed, flux, backup, etc.) parameters on weld performance were evaluated. Although some progress was demonstrated, the capability for generation of sound autogenous laser weldments in these alloys on a reproducible basis was not established within the scope of this program. Areas of endeavor which might be expected to produce further significant improvement in the ability to laser weld 5000 series aluminum alloys are not evident at this time. GRA

ELECTRIC FUEL NOZZLES FOR COMBUSTORS
W. Jansen, I. P. Krepchin, M. J. Paradise, R. Cignoni, R. D. Grzybinski, E. P. Demetri, M. Platt, E. R. Norster, and W. H. Robinson 7 Mar. 1979 65 p refs
(Contract EY-76-C-03-1442)
(SAN/1442-79/T1) Avail: NTIS HC A04/MF A01

The feasibility of electrically charging the fuel droplets from a conventional atomizer by means of high-voltage electrodes was investigated. This method of fuel injection was proposed to improve the uniformity of the fuel/air distribution in the combustion zone and, at the same time, reduce power requirements by eliminating the need to introduce turbulent air flows and the accompanying large pressure drops. Two nozzle configurations, both utilizing the principle of corona discharge, were designed and fabricated. The initial tests were performed but the results did not warrant further testing. The fuel was not sufficiently charged to affect distribution. The conclusion was that droplets were moving too fast and their conductivity was too low for adequate charging to take place. Another effect observed, however holds the promise of eventually applicable to an electric nozzle. This is the phenomenon in which a thin film of jets shooting off the surface. DOE

DEVELOPMENT OF HIGH-TEMPERATURE TURBINE SUBSYSTEM TECHNOLOGY TO A TECHNOLOGY READINESS STATUS, PHASE 2 Quarterly Report, Apr. - Jun. 1978
A. Caruvana, E. D. Alderson, N. R. Antrim, H. V. Doering, R. P. Dubois, M. Dreedman, and R. Frishmuth Jul. 1978 185 p refs
(Contract EX-76-C-01-1806)
(FE-1806-48) Avail: NTIS HC A09/MF A01

Progress is reported in a program design to bring to technology readiness, over a six- to ten year duration, a coal-derived fuel at a firing temperature of 2600 F with growth capability 3000 F. The objectives of phase 2 are to: perform component design and trade-off analyses in sufficient depth to support the component design and test tasks; and update the phase 1 combined cycle studies to evaluate the commercial viability of a GE-TRV turbine system. Information is included on hot gas path development test facilities, low BTU gas cleanup system, motorized rig test air turbine tests, liquid- and gas-fueled combined cycle power plants, turbine subsystem design, update of verification tests system definition and technology readiness vehicle design. DEVELOPMENT OF A ROTARY HIGH PRESSURE DISPLACEMENT PUMP FOR REVERSED OSMOSIS SYSTEMS FOR SEAWATER DESALINATION Final Report
Gerhard Bardewyck (Bornemann (J. H.) Company) Dec. 1978 40 p In GERMAN; ENGLISH summary
(BMFT-FB-M-78-08) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Energie, Phys., Math., Eggenstein-Leopoldshafen, West Germany DM 8.40

A rotary screw pump was developed for use in plants accomplishing sea water desalination through reverse osmosis. The pump operates at pressures of up to 100 bar, has better than average efficiency, and is free of pulsation. Studies were performed to optimize the rotor profiles of the pump. Author (ESA)

STUDY AND DETAIL DESIGN OF THE ENGINEERING MODEL OF A VAPOR COMPRESSOR TO BE USED IN SPACE Final Report
F. Berner, H. Oesch, and O. Joeri Dec. 1979 85 p refs
(Contract ESA-3770/78-NL-PP)
(F/W-FO-1498; ESA-CR(P)-1277) Avail: NTIS HC A05/MF A01

An engineering model of a vapor compressor was designed for a refrigeration unit to be used in Spacelab. The piston compressor which, when incorporated in an optimally controlled refrigeration unit using freon 12 as the working fluid, allowed cooling of a payload down to about -27 C at heat removal rates of about 70 W under conditions where the heat sink fluid enters the condenser with a temperature of 40 C. Alternately, the heat removal rate at the source was increased to about 3 W. The shaft power required by the compressor under these conditions was expected to be about 12 W. The compressor was designed to operate under normal atmospheric conditions along with its drive unit even if placed in a vacuum. Author (ESA)

Small-angle scattering profiles from HSLA steels (Fe-0.05C-1.0Mn-0.12Nb-0.06Al) annealed at various temperatures ranging between 660 C and 1000 C were obtained. The values obtained from Guinier analysis and size distribution calculations were compared with those obtained from electron micrographic observations, and were shown to agree satisfactorily. Similar data were obtained from samples of Ni-P amorphous glasses annealed at 295 C, 400 C, and 500 C. No crystallization effects were observed from 295 C sample. The Guinier plots of the 400 C and 500 C samples indicate good agreement with the expected behavior due to annealing of the amorphous state; namely, the higher annealing temperatures correspond to larger microcrystallite sizes. GRA

DECISION PATH APPROACH TO GUIDANCE FOR CLIMATIC ENVIRONMENTAL TEST PLANNING (MIL-STD-810C) Technical Progress Report, 1 Oct. 1978 - May 1979
J. W. Hamilton and S. Cohen 12 Apr. 1979 133 p refs
(Contract DAAK70-78-C-0026)
(AD-A080909; ETL-0183) Avail: NTIS HC A07/MF A01 CSCL 14/2

The decision path method developed in this report provides a step-by-step logical approach to guidance for users of MIL-STD-810C. The method comprises systematic procedures for characterizing items of materiel and defining environments prior to designing tests. It is equally applicable as a general approach to all climatic environmental tests and as a specific approach to each climatic environmental test method in the Standard. Use of this approach should contribute to a better understanding of the MIL-STD's purpose, enhance its utility, and promote better correlation of test results. GRA

The method of phase spectroscopy was applied to measure dispersions of longitudinal and transverse waves in graphite-epoxy and boron-epoxy composite materials over a wide frequency range. A method to determine the attenuation from the dispersion based on the Kramers-Kronig relations was developed. To separate the attenuation due to scattering, and that due to viscosity, dispersion and attenuation of waves in a laminated viscoelastic composite material was analyzed using a statistical theory of multiple scattering. ELASTIC-PLASTIC DEFORMATION AT FINITE STRAIN Ph.D. Thesis
Vlado A. Lubarda 1980 45 p
Avail: Univ. Microfilms Order No. 8011672

Almost all current elastic-plastic theory is based on the total strain-rate being expressed as the sum of elastic and plastic strain-rates. This assumption and the kinematic model on which it is based are invalid and lead to erroneous conclusions. By defining plastic deformation as the residual deformation after unloading to zero macroscopic stress, the careful separation of elastic and plastic strain-rates is correctly achieved. On this basis the rate (incremental) type constitutive law for time independent material is rigorouly established. The law is not restricted to infinitesimal elastic strains, and Prandtl-Reuss equations follow as a special case of this general theory. The established constitutive law is then incorporated into the structure of the finite deformation variational principle by deriving the expression for the rate potential function. This is oriented toward the direct use in the finite element evaluation of boundary-value problems. The presentation and the development of the whole theory is given at the level of modern continuum mechanics. Dissert. Abstr.

N80-23673 Minnesota Univ., Minneapolis.
STUDIES IN THE SMALL MOTIONS OF VISCOELASTIC SOLIDS Ph.D. Thesis
Prakash Mahadeo Dixit 1979 187 p
Avail: Univ. Microfilms Order No. 8011794

The reduced canonical forms of the stress and equations of motion governing the motions which perturb the natural state of viscoelastic solids are derived. For simplicity only homogeneous, isotropic, incompressible solids are considered. The questions of uniqueness and stability are considered. It is shown that if the elastic constant and the viscoelastic function associated with the operator satisfy certain mild and physically natural conditions, then the limiting form of the solution as t approaches infinity is unique. This is equivalent to saying that under the above conditions the natural state of an incompressible solid is stable in linear approximation. Uniqueness of solutions of the initial-history-boundary-value problem is also considered. Also two free surface problems are considered. These problems involve computing the distortion of cylindrical or plane surfaces of solids in the natural state. In the problem of the sheared block the distortion occurs at first order while in the torsion of a viscoelastic cylinder arises at second order. In both the problems the motion is governed by fourth order partial differential equations. Dissert. Abstr.

MATHEMATICAL MODEL FOR THE SEPARATION OF GUST AND MANOEUVRE LOADS OF CIVIL AIRCRAFT
J. Taylor 1979 28 p refs
(FB-141(1979); ICAF-1135) Avail: NTIS HC A03/MF A01

Ignoring the unsteady lift functions, the normal acceleration response of an aircraft at its centre of gravity to a simplified

turbulence spectrum varying as frequency to the power -5/3 were studying. It is shown that the pitching influence usually reduces the response at long wavelengths from that produced by heaving alone. This influence was relatively small in piston-engined aircraft but has generally become greater as aircraft have developed. The increased response at long wavelengths in modern aircraft makes the problem of separating maneuvres from gust response more difficult but it is attenuated somewhat by the pitching contributions to the response. Experimental studies on a T33, on a Concorde and on a Transall indicate that a band frequency exists where the manoeuvres and turbulence responses are both small so that a filter within this band should separate one type of response from the other. Author

SHEAR LIPS ON FATIGUE FRACTURES IN ALUMINUM ALLOY SHEET MATERIAL
J. Schijve Sep. 1979 26 p refs
(LR-287; ICAF-1112) Avail: NTIS HC A03/MF A01

Shear lip width measurements and the transition of tensile mode fatigue cracks to shear mode fatigue cracks, as observed on fatigue crack surfaces of aluminum alloy sheet material are analyzed. It is shown that these phenomena were controlled by delta K sub eff rather than K sub max or delta K. For crack growth in air the shear lip width was approximately proportional to the square of delta K sub eff, but is was significantly larger than the estimated size of the reversed plastic zone. The initiation of shear lips, the transition from plane stress to plane strain along the crack front, and the environmental effect on shear lips are briefly considered in the discussion. M.G.

ELASTIC CONSTANTS FOR SUPERPLASTICALLY FORMED/DIFFUSION-BONDED CORRUGATED SANDWICH CORE
William L. Ko May 1980 82 p refs
(NASA-TP-1562; H-1094) Avail: NTIS HC A05/MF A01 CSCL 20K

Formulas and associated graphs for evaluating the effective elastic constants for a superplastically formed/diffusion bonded (SPF/DB) corrugated sandwich core, are presented. A comparison of structural stiffnesses of the sandwich core and a honeycomb core under conditions of equal sandwich core density was made. The stiffness in the thickness direction of the optimum SPF/DB corrugated core (that is, triangular truss core) is lower than that of the honeycomb core, and that the former has higher transverse shear stiffness than the latter. VISUALIZATION OF IMPACT DAMAGE OF COMPOSITE PLATES BY MEANS OF THE MOIRE TECHNIQUE
W. G. Knauss, C. D. Babcock, and H. Chai Apr. 1980 53 p refs
(Grant NsG-1483)
(NASA-CR-159261; SM-79-9) Avail: NTIS HC A04/MF A01 CSCL 11D

The phenomenological aspects of propagation damage due to low velocity impact on heavily loaded graphite-epoxy composite laminates were investigated using high speed photography coupled with the moire fringe technique. High speed moire motion records of the impacted specimens are presented. The results provide information on the time scale and sequence of the failure process. While the generation of the initial damage cannot always be separated temporally from the spreading of the damage, the latter takes place on the average with a speed on the order of 200 m/sec. ROOM TEMPERATURE MECHANICAL PROPERTIES OF SHUTTLE THERMAL PROTECTION SYSTEM MATERIALS
James Wayne Sawyer and Donald R. Rummler Apr. 1980 39 p ref
(NASA-TM-81786) Avail: NTIS HC A03/MF A01 CSCL 20K

Tests were conducted at room temperature to determine the mechanical properties and behavior of materials used for the thermal protection system of the space shuttle. The materials investigated include the LI-900 RSI tiles, the RTV-560 adhesive and the .41 cm (.16 thick) strain isolator pad (SIP). Tensile and compression cyclic loading tests were conducted on the SIP material and stress-strain curves obtained for various proof loads and load cyclic conditioning. Ultimate tensile and shear tests were conducted on the RSI, RTV, and SIP materials. The SIP material exhibits highly nonlinear stress-strain behavior, increased tangent modulus and ultimate tensile strength with increased loading rate, and large short time load relaxation and moderate creep behavior. Proof and cyclic load conditioning of the SIP results in permanent deformation of the material, hysteresis effects, and much higher tensile tangent modulus values at large strains. R.E.S.

A procedure for sizing an airframe for flutter-free performance is demonstrated on a large, flexible supersonic transport aircraft. The procedure is based on using a two level reduced basis or modal technique for reducing the computational cost of performing the repetitive flutter analyses. The supersonic transport aircraft exhibits complex dynamic behavior, has a well-known flutter problem and requires a large finite element model to predict the vibratory and flutter response. Flutter-free designs were produced with small mass increases relative to the wing structural weight and aircraft payload. R.E.S.

PRACTICAL IMPLEMENTATION OF THE DOUBLE LINEAR DAMAGE RULE AND DAMAGE CURVE APPROACH FOR TREATING CUMULATIVE FATIGUE DAMAGE
S. S. Manson (Case Western Reserve Univ.) and G. R. Halford Apr. 1980 50 p refs
(NASA-TM-81517; E-387) Avail: NTIS HC A03/MF A01 CSCL 20K

Simple procedures are presented for treating cumulative fatigue damage under complex loading history using either the damage curve concept or the double linear damage rule. A single equation is provided for use with the damage curve approach; each loading event providing a fraction of damage until failure is presumed to occur when the damage sum becomes unity. For the double linear damage rule, analytical expressions are provided for determining the two phases of life. The procedure involves two steps, each similar to the conventional application of the commonly used linear damage rule. When the sum of cycle ratios based on phase 1 lives reaches unity, phase 1 is presumed complete, and further loadings are summed as cycle ratios on phase 2 lives. When the phase 2 sum reaches unity, failure is presumed to occur. No other physical properties or material constants than those normally used in a conventional linear damage rule analysis are required for application of either of the two cumulative damage methods described. Illustrations and comparisons of both methods are discussed. Author

COMPARISON OF STRUCTURAL BEHAVIOR OF SUPER-PLASTICALLY FORMED/DIFFUSION-BONDED SANDWICH STRUCTURES AND HONEYCOMB CORE SANDWICH STRUCTURES
William L. Ko Jun. 1980 35 p refs
(NASA-TM-81348) Avail: NTIS HC A03/MF A01 CSCL 20K

A superplasticity formed/diffusion-bonded (SPF/DB) orthogonally corrugated core sandwich structure is discussed and its structural behavior is compared to that of a conventional honeycomb core sandwich structure. The stiffness and buckling characteristics of the two types of sandwich structures are compared under conditions of equal structural density. It is shown that under certain conditions, the SPF/DB orthogonally corrugated core sandwich structure is slightly more efficient than the optimum honeycomb core (square-cell core) sandwich structure. However, under different conditions, this effect can be reversed. R.C.T.

APPLICATIONS OF GENERALIZED DERIVATIVES TO VISCOELASTICITY
Ronald L. Bagley Nov. 1979 119 p refs
(AF Proj. 2418)
(AD-A081131; AFML-TR-79-4103) Avail: NTIS HC A06/MF A01 CSCL 20/11

Generalized derivatives of fractional order are used to construct stress-strain constitutive relations for viscoelastic materials, based on the observed sinusoidal behavior of the materials. The non-periodic behavior of one material is observed in the laboratory and compares favorably with the non-periodic behavior of the material predicted by its generalized derivative constitutive relation. Having established that the generalized derivative constitutive relation is an appropriate mathematical model for the general motion of at least one viscoelastic material, the tools for the analysis of structures of engineering interest are put forward. In particular, attention is focused on a finite element formulation of and solutions to the equations of motion for structures containing elastic and viscoelastic components. GRA

CRITICAL DAMPING IN LINEAR DISCRETE DYNAMIC SYSTEMS
D. E. Beskos and B. A. Boley Nov. 1979 23 p refs Prepared in cooperation with Minnesota Univ., Minneapolis
(Contract N00014-75-C-1042)
(AD-A081085; TR-1979-2) Avail: NTIS HC A02/MF A01 CSCL 20/11

Free viscously damped vibrations of linear discrete structural systems are studied. The amount of damping varies among the various structural elements of the system resulting in several critical damping possibilities. A general method is developed for determining the critical damping surfaces of a system. These surfaces represent the loci of combinations of damping values corresponding to critically damped motions, and thus separate regions of partial or complete underdamping for those of overdamping. The dimension of a critical damping surface is equal to the number of independent amounts of damping present in the system. The determination of the surface point corresponding to equal amounts of damping is considerably simplified for systems which, on the assumption that all amounts of damping are equal, possess a damping matrix of the Rayleigh type. Three examples presented in detail illustrate the proposed technique and some of the important characteristics of critical damping surfaces. GRA

SOME COMMENTS ON THE ENDOCHRONIC THEORY OF PLASTICITY
R. S. Rivlin Oct. 1979 47 p refs
(Contract N00014-76-C-0235)
(AD-A081825; CAM-100-33) Avail: NTIS HC A03/MF A01 CSCL 20/13

Two endochronic theories of plasticity advanced by Valanis in 1971 and 1978 are discussed critically. It is concluded that the first of these theories, which does not involve a yield surface or a separation of strain into plastic and elastic components, cannot form an appropriate basis for the mechanics of metals. The second theory is a more conventional theory involving a yield surface with kinematic and isotropic hardening. However, there is no evidence that the particular laws employed by Valanis accord with experiment. GRA

(AD-A081469; LMSC-D684018; AFOSR-80-0136TR) Avail: NTIS HC A03/MF A01 CSCL 11/4

Task 1 hygrothermal, viscoelastic plane stress and generalized plane strain analysis codes were developed and employed to determine the influence of hygrothermal history on laminate inplane and free edge stresses and dimensional stability. Task 2 monographs were written on plastic buckling, stability and optimization of panels, and buckling of shells. The surveys include many examples of nonlinear collapse and bifurcation buckling in which moderately large deflections, nonlinear material effects, and imperfections are accounted for. Their purpose is to give the reader a physical feel for thin shell behavior that will help him to design appropriate tests and perform efficient numerical analyses with existing computer programs for the treatemnt of structures composed of thin sections. TENSILE CRACK EXPOSURE TESTS. REPORT 3: LABORATORY EVALUATION OF SERIES A BEAMS WITH RESULTS FROM 1951 TO 1975

Edward F. ONeil Jan. 1980 73 p refs

(AD-A081302; WES-TM-6-412-3; Rept-3) Avail: NTIS HC A04/MF A01 CSCL 13/13

A study was begun in 1950 to determine the effects of severe natural weathering to stressed, reinforced concrete beams of various compositions and degrees of stress. The objectives of the study were to obtain information on the long-term weathering of air-entrained and nonair-entrained concrete beams containing steels of different compositions, types of deformation, and having different levels of stress in the steel that caused varying degrees of cracking of the concrete. The beams were fabricated, cured, and loaded at the U.S. Army Engineer Waterways Experiment Station (WES) in 1951, then shipped to Eastport, Maine, and placed on the beach at the natural weathering exposure station on the south side of Treat Island, Cobscock Bay, Eastport, and Lubec. The beams were subjected to twice daily tidal cycles exposing them to wetting under considerable head, and drying to surface dry conditions. The beams were inspected annually during the exposure period and evaluated by a team of inspectors rating the degree of deterioration. Each year, maximum crack widths were measured beginning in 1956 and continuing until 1975 when the exposure period was concluded after 25 years of weathering. The results of the exposure study and the laboratory investigation indicated, among other findings, that stressing the steel to varying levels of stress over the exposure period did not reduce the ultimate moment carrying capacity of the beams; the maximum areas of corrosion occurred at spalled areas; corrosion to the steel could not be located at any flexural crack smaller than 0.015 in. (0.38 mm); and no area of maximum reduction of cross-sectional are due to corrosion occurred at the flexural cracks. GRA

AN INVESTIGATION OF RESIDUAL STRESSES IN SIMULATED WING PANELS OF 7075-T6 ALUMINUM M.S. Thesis

Edward C. Engle Dec. 1979 46 p refs

(AD-A080863) Avail: NTIS HC A03/MF A01 CSCL 11/6

The advent of onboard aircraft microprocessor fatigue monitoring systems will establish the opportunity to fully exploit residual stresses at stress-critical areas, including their effects on fatigue predictions. An experimental investigation was undertaken to more fully understand them by making photoelastic measurements of residual stresses at notches in simulated wing panels of 7075-T6 aluminum and to establish the relationships between local stresses, residual stresses, and the far-field or applied stress. The stress concentration factors were found to decrease with increased plastic deformation while the strain concentration factors were found to remain constant. The residual stress levels were found to be immutable despite changes in fatigue loading conditions, notch geometry, or test duration.GRA

LIGHTER AND STRONGER

A. J. Durelli and K. Rajaiah Feb. 1980 54 p refs

(Contract N00014-76-C-0487; Grant NSF ENG-77-07974)

(AD-A081317; Rept-53) Avail: NTIS HC A04/MF A01 CSCL 20/11

A new method has been developed that permits the direct design of shapes of two dimensional structures ad structural components, loaded in their plane, within specified design constraints and exhibiting optimum distribution of stresses. The method uses photoelasticity and requires a large field diffused light polariscope. Several problems of optimization related to the presence of holes in finite and infinite plates, subjected to uniaxial and biaxial loadings, are solved parametrically. Some unexpected results have been found: (1) the optimum shape of a large hole in a bar of finite width, subjected to uniaxial load, is 'quasi' square, but the transverse boundary has the configuration of a 'hat'; (2) for the small hole in the large plate, a 'barrel' shape has a lower s.c.f. than the circular hole and appreciably higher coefficient of efficiency; and (3) the optimum shape of a tube, subjected to diametral compression, has small 'hinges' and is much lighter and stronger than the circular tube. Applications are also shown to the design of dove-tails and slots in turbine blades and rotors, and to the design of star-shaped solid propellant grains for rockets. GRA

THE EQUATIONS OF ELASTICITY ARE SPECIAL

C. M. Dafermos Oct. 1979 15 p refs

(Contract N00014-76-C-0278; Grants DAAG29-76-G-0294; NSF MCS-79-05774)

(AD-A081668) Avail: NTIS HC A02/MF A01 CSCL 20/1

In dynamics, the goal is to relate the Second Law of thermodynamics with 'stability'. The work of Ericksen reveals that the Second Law induces stability of an equilibrium state of a thermoelastic material in the range of convexity of internal energy (e.g., at points where energy attains a minimum.) Similarly, it has been shown that smooth adiabatic processes in thermoelasticity, residing in the range of convexity of internal energy, depend continuously upon the initial state, even within the class of processes that develop shock waves. Actually, in certain circumstances, the same result can be established under a mere strong ellipticity assumption. GRA

ANALYTICAL STRESS ANALYSIS OF ELASTIC COMPOSITES WITH CRACKS Final Report

D. B. Bogy Aug. 1979 74 p refs

(Contract W-7405-eng-48)

(UCRL-15109) Avail: NTIS HC A04/MF A01

The elastostatic axisymmetric problem of a sphere, containing a centrally located penny-shaped crack, embedded in a dissimilar matrix subject to far field loads is solved. First the problem of a cracked sphere is solved by using Boussinesq stress-functions. Two coordinate systems - oblate spheroidal for representing the crack surface and spherical polars for the spherical surface - are used to satisfy boundary conditions. Integral representations and transformations of harmonic functions are used to relate stress-functions in the two coordinate systems. This procedure leads to a system of algebraic equations which are solved, for axisymmetric tractions on both the surfaces. This solution is then used to obtain the solution of the original problem. A representation of the solution for the axisymmetric problem of a crack in an infinite medium is also presented. DOE

BOUNDARY VALUE PROBLEMS OF THE CIRCULAR CYLINDERS IN THE STRAIN-GRADIENT THEORY OF LINEAR ELASTICITY
B. G. Kao Nov. 1979 43 p refs
(Contract DE-AT03-76ET-35300)
(GA-A-15142) Avail: NTIS HC A03/MF A01

Three boundary value problems in the strain-gradient theory of linear elasticity are solved for circular cylinders: the twisting of circular cylinders, uniformly pressuring of concentric circular cylinders, and pure-bending of simply connected cylinders. The comparisons of these solutions with the solutions in classical elasticity and in couple-stress theory reveal the differences in the stress fields as well as the apparent stress fields due to the influences of the strain-gradient. These aspects of the strain-gradient theory could be important in modeling the failure behavior of structural materials. DOE

IMPLICIT STRAIN-HARDENING FORMULATION FOR CREEP ANALYSIS
B. R. Bass, W. G. Johnson, and S. V. McGrath May 1979 29 p refs
(Contract W-7405-eng-26)
(K/CSD/TM-30) Avail: NTIS HC A03/MF A01

A variable stiffness method for creep analysis is presented which utilizes a strain hardening theory of creep and an implicit time marching scheme. The formulation uses the change in stress and accumulated creep strain during a time interval to determine the corresponding creep strain increment. The method is suited for use in formulations of elastic plastic creep and large displacement, small strain analysis. Applications presented demonstrate that this implicit method offers numerical stability using relatively large time steps for which the conventional explicit scheme fails to function. DOE

FATIGUE IN WELDED METAL STRUCTURES: AN INTRODUCTORY REPORT TO A RESEARCH PROGRAM
Pierre Brevet, Dominique Francois, Jean-Paul Gourmelon, and Andre Raharinaivo Nov. 1978 64 p refs In FRENCH; ENGLISH summary
(LPC-85) Avail: NTIS HC A04/MF A01

The problem of fatigue in welded metal structures is discussed using a review of the mathematical and physical theories of damage. The notions of lifetime and endurance of the parts subjected to fatigue are examined and the characteristic Woehler's and Goodman-Smith's diagrams are presented. The points in a metal structure carrying traffic which are most liable to the risks of fatigue damage are indicated. The influence of the characteristics of welded joints on the behavior of assemblies under fatigue is examined. The characteristics are either of a geometric nature, including porosity, blisters, and defects such as lack of fusion, or of a metallurgical origin. Ways of improving the behavior of welded joints under fatigue are indicated. Author (ESA)

CHANCES AND HANDICAPS OF ROD-BEAM THEORIES
Dieter Peterson Nov. 1979 39 p refs Transl. into ENGLISH of "Moeglichkeiten und. Grenzen der Stabtheorien", Rept. DFVLR-FB-78-13 DFVLR, Brunswick, Jul. 1978 Original report in GERMAN previously announced as N79-30583
(ESA-TT-568; DFVLR-FB-78-13) Avail: NTIS HC A03/MF A01; ZLDI, Munich DM 17,50

The assumptions inherent in the hypotheses of rod-beam theories, such as the one of Bernoulli suggesting even cross-sections under deformation, limit the accuracy of analysis. It is shown that for higher order terms geometrically nonlinear deformations are in contradiction with rod-beam hypotheses. The consistent use of differential calculus uncovers simultaneously geometric differences between current rod-beam theories of higher order. These differences are examined using simple examples. THE EFFECT OF FOAMED HARD PLASTIC STIFFENERS ON ALUMINUM SHEAR WEBS B.S. Thesis
A. Breeze-Stringfellow and A. C. Duthie Jun. 1979 52 p refs
(BU-237) Avail: NTIS HC A04/MF A01

The effect of foamed hard plastic stiffeners on aluminum shear webs was investigated. Shear webs of varying gauges were tested with varying depths of stiffener, the stiffener width and spacing being kept constant. The foam used was Rohacell 31 and the aluminum was L72. The addition of foam stiffeners increased the workable stress and shear stiffness of the shear web. Above a certain depth of stiffener, no further increase of workable stress and web stiffness was found; it was this depth that was taken as the optimum value. Author (ESA)

PEAK WIND LOADS ON CLADDING PANELS AND THEIR DEPENDENCE UPON PANEL SIZE
M. E. Greenway 1979 45 p refs
(OUEL-1286/79) Avail: NTIS HC A03/MF A01

Peak wind induced loads on cladding panels fixed to the windward face of a building are considered. A total of two gust factor equations are derived which describe the ratio of the peak load on a cladding panel to the mean load. The equations do not apply if the panel is in a region of separated flow. The first equation is based on a linearized theory for the pressure developed on the windward face of a tall building; the second is a nonlinear form of the same equation. The equations are used to calculate peak loads on cladding panels positioned at various heights on a tall building. An explanation is offered for the observed relatively frequent failure of cladding panels at low levels on some tall buildings. Author (ESA)

AN ANALYSIS OF THE STATIC AND DYNAMIC INSTABILITY OF THICK CYLINDERS
John D. Renton 1979 20 p refs
(OUEL-1292/79) Avail: NTIS HC A02/MF A01

A general solution of Bolotin's differential equations for the dynamic stability of a homogenous isotropic medium is given. This takes the form of displacement functions, which express the solution as a sum of dilatational and distortional effects. Solutions are found for the vibration of cylinders of finite thickness when initial axial stresses are present. It is shown that simple vibration and simple buckling are cases of the general solution. The results are compared with approximate formulas for the buckling of thin cylinders and it is shown that the known solution for the natural frequency of unloaded cylinders is a particular case. MODELING THE CIRCULATION OF CARBON IN THE WORLD'S TERRESTRIAL ECOSYSTEMS
W. R. Emanuel, G. G. Killough, and J. S. Olson 1979 40 p refs
(Contract W-7405-eng-26; Grant NSF DEB-77-26722)
(DOE/TIC-10293) Avail: NTIS HC A03/MF A01

A mathematical model for the circulation of carbon in the world terrestrial ecosystems is proposed. A five compartment representation is developed which corresponds to the functional components studied by field ecologists. Rate coefficients for this linear dynamic model are calculated from estimates of the 1970 standing crop and compartment exchanges of carbon. The model is analyzed in terms of response to a unit impulse, thereby displaying a transient time distribution. The response to a hypothetical pulse input through gross primary production is also simulated, illustrating the efficiency of the terrestrial carbon system in transferring carbon into longer storage components. The concept of CO_2 fertilization is examined by allowing gross primary production to increase in response to higher atmosphere concentrations. DOE

COAL-SHALE INTERFACE DETECTOR Patent
Harry Reid, Jr., inventor (to NASA) Issued 1 Apr. 1980 8 p Filed 3 Nov. 1977
(NASA-Case-MFS-23720-1; US-Patent-4,195,512; US-Patent-Appl-SN-848419; US-Patent-Class-73-12; US-Patent-Class-73-82) Avail: US Patent and Trademark Office CSCL 08I

A coal-shale interface detector for use with coal cutting equipment is described. The detector consists of a reciprocating hammer with an accelerometer to measure the impact of the hammer as it penetrates the ceiling or floor surface of a mine. Additionally, a pair of reflectometers simultaneously view the same surface, and the outputs from the accelerometer and reflectometers are detected and jointly registered to determine when an interface between coal and shale is being cut through.

Unsupervised training procedures were used to statistically and spatially analyze spectral variation in LANDSAT-2 MSS data for a semiarid watershed in east-central Utah. Categorization of the signatures was accomplished with a factor analysis procedure. Interclass distances among all signatures were computed, and a standardization distance matrix entered into an oblique factor analysis. Factors derived from the reduction of interclass similarities among signatures were interpreted as core land cover categories. Each of the land cover categories is an integrated terrain unit, consisting of similar vegetation and surface geology. The optimum number of integrated terrain units is readily determined. Categorization of signatures with this methodology allows a researcher to evaluate the adequacy of the signatures generated in an unsupervised training approach to actually represent land cover variation. If the optimum number of land cover categories is not known prior to classification of LANDSAT data, the basic number as represented in the LANDSAT signatures, is identified by this method which contributes to the labelling and categorization of individual signatures to the core land cover categories.

HYDROLOGIC EVALUATION OF THE STORMFLOW GENERATION PROCESS ON A FORESTED WATERSHED Ph.D. Thesis
Edward Sisk Corbett 1979 149 p
Avail: Univ. Microfilms Order No. 8010041

An irrigation system was designed to apply a uniform amount of simulated rainfall to parts or all of a 19.59 acre experimental watershed in central Pennsylvania. To delineate the stormflow contributing areas and to evaluate their relative efficiency in converting rainfall into stormflow, a series of simulated rainfall applications were made, starting with the channel area and progressively increasing the application areas up the side slopes. The applications were made at both dry and wet antecedent soil moisture conditions and at three primary application amounts, 0.96, 1.50, and 1.92 inches. All rainfall applications were made at the rate of 0.24 inches per hour. There was a rapid reduction in the efficiency with which rainfall is converted to stormflow as distance from the perennial stream channel increases under dry antecedent soil moisture conditions. Under wet antecedent soil moisture conditions the watershed contributes to stormflow in a more uniform manner and the stormflow components becomes highly correlated with storm amount. There was large increase in the efficiency with which the middle and upper slope soil zones converted rainfall into quickflow as positive hydraulic gradients became established in these areas of the watershed.

LAND USE INTENSITY AND WATER QUALITY Ph.D. Thesis
Donald William Duckson, Jr. 1979 181 p
Avail: Univ. Microfilms Order No. 8011272

The relationship between land use and water quality in three watersheds tributary to the Potomac is as examined. Specfically concomitant changes in water quality which result from land use alterations were determined. A predictive device for estimating the rate and direction fo water quality changes brought about by a mosaic of land uses which themselves, are in flux, was developed. Mosaics of land uses were evaluated using and empirically-derived index of land use intensity. Index values were used as the independent varible in a series of regression equations which dissolved oxygen, pH, total dissolved solids, total iron, and total hardness (EDTA) were dependent varibles. Regressions provided statistically significant: results only for TDS, iron, and hardness and indicate a predictable rate of change for selected water quality parameters with changes in the intensity of land use. No distinction between classes of land use was possible.

The author has identified the following significant results. Least squares techniques were applied for parameter estimation of functions to predict winter wheat phenological stage with daily maximum temperature, minimum temperature, daylength, and precipitation as independent variables. After parameter estimation, tests were conducted using independent data. It may generally be concluded that exponential functions have little advantage over polynomials. Precipitation was not found to significantly affect the fits. The Robertson triquadratic form, in general use for spring wheat, yielded good results, but special techniques and care are required. In most instances, equations with nonlinear effects were found to yield erratic results when utilized with averaged daily environmental values as independent variables.

(E80-10104; NASA-CR-160479; Rept-06277) Avail: NTIS HC A02/MF A01 CSCL 05B

The author has identified the following significant results. Full-frame classifications of wheat and non-wheat for eighty counties in Kansas were repetitively sampled to simulate alternative sampling plans. Evaluation of four sampling schemes involving different numbers of samples and different size sampling units shows that the precision of the wheat estimates increased as the segment size decreased and the number of segments

was increased. Although the average bias associated with the various sampling schemes was not significantly different, the maximum absolute bias was directly related to sampling size unit.

(E80-10105; NASA-CR-160478; LARS-TR-041279) Avail: NTIS. HC A02/MF A01. CSCL 05B.

The author has identified the following significant results. Data sets for corn, soybeans, winter wheat, and spring wheat were used to evaluate the following schemes for crop identification: (1) per point Gaussian maximum classifier; (2) per point sum of normal densities classifiers; (3) per point linear classifier; (4) per point Gaussian maximum likelihood decision tree classifiers; and (5) texture sensitive per field Gaussian maximum likelihood classifier. Test site location and classifier both had significant effects on classification accuracy of small grains; classifiers did not differ significantly in overall accuracy, with the majority of the difference among classifiers being attributed to training method rather than to the classification algorithm applied. The complexity of use and computer costs for the classifiers varied significantly. A linear classification rule which assigns each pixel to the class whose mean is closest in Euclidean distance was the easiest for the analyst and cost the least per classification.

The author has identified the following significant results. HCMM day/night coverage 12 hours apart cannot be obtained at 26 deg N latitude; nor have any pairs 36 hours apart been obtained. A day-IR scene and a night scene for two different dates were analyzed. A profile across the test site for the same latitude shows that the two profiles are near mirror images of each other over land surfaces and that the temperature of two large water bodies, Falcon Reservoir and the Gulf of Mexico, are nearly identical on two dates. During the time interval between overpasses, the vegetative cover remained static due to winter dormancy. The data suggest that day/night temperature differences measured weeks apart may yield meaningful information about the contrast between daytime maximum and nighttime minimum temperatures for a given site.

RESEARCH FOR INFORMATION EXTRACTION FROM AERIAL IMAGERY
Robert D. Leighty Oct. 1979 14 p refs Presented at the Remote Sensing Symp., Ft. Belvoir, Va., 29-31 Oct. 1979
(AD-A080744; ETL-R001) Avail: NTIS HC A02/MF A01 CSCL 05/8
The U.S. Army Engineer Topographic Laboratories is investigating a number of approaches to information extraction from aerial imagery. Two approaches will be discussed in this paper: automated feature extraction research and computer-assisted photo interpretation research. The discussion of automated information extraction indicates present day capabilities of automated systems, problems facing automated information extraction, and directions which basic research must take to achieve automated 'smart analysis systems' in the distant future. The discussion of computer-assisted photo interpretation will describe the research system now being developed and experiments for research which is expected to have value in the near future for increasing the quality and efficiency of the total information extraction processes. AUTOMATION IN PHOTOGRAMMETRY
James B. Case 25 Jul. 1980 14 p refs
(AD-A081562) Avail: NTIS HC A02/MF A01 CSCL 08/2

All functional aspects of photogrammetry, i.e., triangulation mensuration, elevation data extraction, planimetric data extraction, and rectification and orthorectification, are now being automated to some degree. Automation extends from computer control of comparators and analog stereo plotters, through the analytical stereoplotters, to orthophoto printers and fully automated correlation equipment. The drive towards automation has been triggered not only by the continuing necessity to reduce costs, but also by the need to generate new products (e.g., DTM, land use, etc.) and to utilize other than conventional mapping photography. These have led, in turn, to the necessity for data editing and data management systems. The trend in the future will be towards the ever-increasing use of digital image processing technology. Examples of several levels of automation in photogrammetry are described. GRA

APPLICATIONS OF DIGITAL DISPLAY IN PHOTOINTERPRETATION AND DIGITAL MAPPING
Bryce L. Schrock Jan. 1980 15 p refs
(AD-A081091; ETL-R004) Avail: NTIS HC A02/MF A01 CSCL 09/2

The Digital Image Analysis Laboratory (DIAL) at USAETL is a large-scale interactive system designed for research and development activities in digital image processing. The system has been successfully applied to a variety of investigations in both digital mapping and photointerpretation as described in this presentation. Recently a Demonstration Image Processing System (DEMONS) has been added to the DIAL system to serve as a high-speed work station for processing very large digital images. Although DEMONS has been reasonably successful in manipulating large images, its limitations indicate that future such systems might be hybrid systems combining the best features of both hardcopy (film) and softcopy (cathode ray tube) exploitation systems. OCEANOGRAPHIC REMOTE SENSING: A POSITION PAPER
R. Goodman, J. Bailey, J. Gallagher, R. Kurk, R. Nagle, V. Moble, A. Pressman, and K. VanSickle 26 Jan. 1979 26 p
(AD-A081494) Avail: NTIS HC A03/MF A01 CSCL 22/2

The purpose of a Navy R D remote sensing plan should be to set forth the requirements and direction of basic and exploratory research in satellite remote sensing which supports the overall Navy oceanographic research and operational programs. The aim of the plan would be to outline the established requirements, objectives, current and planned research programs necessary to achieve the ultimate goals of improved environmental support to the fleet. While the plan will be primarily directed toward 6.1 and 6.2 programs, appropriate consideration for coordination of 6.3 - 6.6 requirements should be addressed. The plan should help serve as a single technology and program reference for implementation and planning of Navy related satellite remote sensing programs. Fundamentally, the plan would: (1) set forth the manner and rate with which the Navy research program should proceed in order to successfully exploit environmental satellite systems supporting Navy and DOD oceanographic requirements, (2) provide guidance to the Assistant Secretary of the Navy for Research, Engineering and Systems (ASNRES) and the Chief of Naval Research in overall program planning, (3) provide research programs which will support the objective of the Naval Oceanographic and Meteorological Support System (NOMSS) Environmental Satellite Plan for predictions for Naval operations. DIGITAL SCREENING AND HALFTONE TECHNIQUES FOR RASTER PROCESSING
Richard L. Rosenthal 14 Jan. 1980 13 p refs
(AD-A081090; ETL-R003) Avail: NTIS HC A02/MF A01 CSCL 14/5

The development of raster processing programs at USAETL has included programs for the generation of raster plot data containing cartographically symbolized features as well as the more widely investigated raster-to-vector software. Raster plot data may be used to generate film negatives with open window areas over which mechanical screens can be placed by conventional contact printing techniques. These areas can also be filled with digitally generated screens, a capability unique with the raster approach. Further, since most available raster plotting hardware does not permit the modulation of each pixel for intensity, it is desirable to control groups of pixels in order to approximate a halftone dot for color or density control. A study was made to determine the suitability of the 25 micron pixel raster on the Digital Laser Platemaker for the generation of digital screens for absolute color and process color printing. Tests will be conducted to establish screen pattern and angle criteria to achieve desired results without moire. An associated literature search resulted in a fairly comprehensive bibliography of work published in the digital screening field. GRA

REMOTE SENSING OF AQUATIC PLANTS Final Report, Sep. 1975 - Sep. 1977
Katherine S. Long Oct. 1979 103 p refs
(AD-A081737; WES-TR-A-79-2) Avail: NTIS HC A06/MF A01 CSCL 14/5

This report summarizes a 3 year effort in evaluating the various available remote sensing methods for identification and assessment of expanses of aquatic plants. Both materials and techniques are examined for cost effectiveness and capability to sense aquatic plants on both the local and regional scales. Computer simulation of photographic responses was employed; LANDSAT, high-altitude photography, side-looking airborne radar, and low-altitude photography were examined to determine the capabilities of each for identifying and assessing aquatic plants. Results of the study revealed LANDSAT to be the most cost effective for regional surveys, although its coarse resolution would be limiting in some cases. High-quality, high-altitude false-color infrared film showed great potential for species identification. Model studies borne out by field demonstrations showed black-and-white infrared photography to have a strong potential for discriminating infested from uninfested areas, with less associated cost than when false-color infrared is used. False-color infrared does show the greatest potential for discriminating among species. Ground-truth information concerning a specific area aids materially in the mapping. Examples of photographs, maps, and cost analyses of two demonstration projects conducted at Lake Marion, South Carolina, and Lake Seminole Florida, are included. GRA

GEOKINETICS IN SITU SHALE OIL RECOVERY PROJECT Annual Report, Mar. 1979
Mar. 1979 61 p
(Contracts ET-78-F-03-1787; DE-FC20-78LC-0787)
(LETC-10787-25; AR-2) Avail: NTIS HC A04/MF A01

Eighteen in situ retorts were constructed, ranging in size from 330 tons to 46,000 tons. Eleven of these retorts were burned, and a total of 5400 barrels of shale oil were recovered. Oil shale thicknesses of 30 feet, and cross-sectional areas of 3800 square feet were successfully blasted. The results are encouraging, and the project will continue to scale up its size of the operation in 1979. DOE

REMOTE SENSING FOR GEOTHERMAL ENVIRONMENTAL ASSESSMENTS Final Report
W. Frei, T. Shibata, and G. C. Huth 30 Jun. 1979 35 p refs
Sponsored in part by California Univ., Lawrence Livermore Lab.
(Contract W-7405-eng-48)
(UCRL-15108) Avail: NTIS HC A03/MF A01

The role of remote sensing is examined in the context of the DOE Environmental Assessment Studies. Particular attention is paid to the exploitation by computer analysis, of low altitude aerial photographs, which were made available for this project.

One technique, change detection, developed during this project, was found to be particularly useful because it permits the detection of environmental changes at a very early stage where it might escape detection on the ground. This technique, which was perfected for use on a routine basis, can thus provide a very effective environmental early warning capability. Several examples are shown in known Geothermal Resource Areas (KGRA's) in the Imperial Valley and the Geysers, California, which lead to the conclusion that remote sensing become an essential tool for the Environmental Assessment Studies. DEVELOPMENT AND TESTING OF A MICROWAVE SYSTEM TO MEASURE COAL LAYER THICKNESS UP TO 25 cm
K. C. Roe and D. A. Ellerbruch Jan. 1979 27 p refs
(Contract ET-77-I-01-8881)
(FE-8881-1; SR-723-8-79) Avail: NTIS HC A03/MF A01

The design, construction and testing of a microwave coal thickness indicator built to demonstrate the hypothesis that an electromagnetic coal interface detector (EMCID) corrected for surface admittance variation can measure coal thickness up to 25 cm within + or - 10 percent accuracy is described. The design is based upon the FM-CW radar technique where reflections from layered strata are detected in time relationship to propagation path lengths. Relative depths to layered strata are displayed in numerical digits. Determining the thickness of the coal layer left on mine-haulageway roofs is important for both mine safety and maximum coal recovery. A specified thickness is required in many mines to maintain roof strength and to prevent exposure of the overlying slate or shale to air, which deteriorates slate and shale. DOE

CHABOT OBSERVATORY REMOTE SENSING EXPERIMENTS (CORSE) Progress Report, 1978 - 1979
W. M. Porch, T. R. Galloway, T. J. Greens, J. O. Waidl, and P. T. Futshcer Jan. 1980 30 p refs
(Contract W-7405-eng-48)
(UCID-18504) Avail: NTIS HC A03/MF A01

A cooperative effort yielded several important results and new techniques for remote sensing of atmospheric parameters. An electro-optical system was developed which simultaneously analyzes regional scale atmospheric constituents such as aerosols H2O, O2, NO2, and O3 while measuring long path averaged wind and atmospheric turbulence in the San Francisco Bay Area. Improvement of these techniques will permit the remote determination of vertical temperature profiles inversion heights, heat fluxes and vertical gradient wind speeds. DOE

CLASSIFICATION OF MULTISPECTRAL REMOTE SENSING DATA
Peter Haberaecker Nov. 1979 64 p refs Transl. into ENGLISH of "Untersuchungen zur Klassifizierung Multispektraler Bilddaten aus der Fernerkundung", Rept. DLR-FB-77-72, Oberpfaffenhofen, West Germany, Jul. 1978 Original report in GERMAN previously announced as N79-30697 Original German report available from ZLDI, Munich DM 108.10 Original contains color illustrations
(ESA-TT-571; DLR-FB-77-72) Avail: NTIS HC A04/MF A01

Different concepts pertinent to classification are defined and a mathematical model, subsequently derived, is described. Various classifiers are theoretically considered. A synthetic and a natural scene, taken from a multispectral aerial photograph, are used to test and illustrate the efficiency of the various classifiers. Results are compared and performance criteria is evolved. Further algorithms are evaluated for feature selection and computation of indexes showing the a priori quality of classification. Finally, an example within the context of regional planning is examined using the classification of multitemporal image data. Author (ESA)

UNIVERSAL TRANSVERSE MERCATOR GRID TABLES FOR LATITUDES 0-80 DEGREES CLARKE 1866 SPHEROID (METERS). VOLUME 2: TRANSFORMATION OF COORDINATES FROM GRID TO GEOGRAPHIC
Jun. 1958 258 p Sponsored by NOAA
(PB80-140411; DA-TM-5-241-4/2; NOAA-80011603) Avail: NTIS HC A12/MF A01 CSCL 08B

Tables are presented to facilitate the transformation of coordinates, as well as the computation of scale factors and convergence of the meridians. All such computations consist essentially of the algebraic summation of the products of north-south factors by powers of east-west factors. The north-south factors are obtained by interpolation; the east-west factors are expressions of the distance from the central meridian. Certain factors of small and slow changing numerical value are expressed by graphs from which the desired term may be interpolated, using both the north-south and east-west factors as arguments. The tables give the following precisions: Grid coordinates to geographic coordinates + or - 0.001 second; convergence of the meridians; + or - 0.01 second; and reduction of lengths by scale factor; + or - in the seventh significant figure. INTERPRETING LAND USE CHANGE THROUGH SATELLITE IMAGERY
Linda K. Lee Dec. 1979 24 p refs
(PB80-127277; AER-442) Avail: NTIS HC A02/MF A01 CSCL 08B

Employing a multiperiod approach to monitor land use change may compound the problems associated with interpretation of satellite imagery. Data from satellite imagery were used to

inventory new cropland development in the Great Plains and 85 counties in the Southeastern Alluvium Coast and Tidewater region between 1972 and 1976. Cloud cover problems, intensified by the two-period approach used, made data more difficult to interpret. Field checks were also more difficult because of the scattered and irregularly shaped land use change sites. GRA

AMPHOTERIC GALLIUM ARSENIDE HETEROFACE SOLAR CELLS Ph.D. Thesis
Samuel Walter Beal 1979 124 p
Avail: Univ. Microfilms Order No. 8010704

The fabrication of a heteroface AlGaAs/GaAs solar cell by liquid phase epitaxy is presented. An amphoteric pn junction produced from a single GaAs:Si melt forms the base. A subsequent Al.85Ga.15As:Ge layer was deposited to provide an optical 'window' to the cell. The three layer structure was produced, then, from only two growth melts. The benefits of the window layer are demonstrated by spectral response comparisons. The efficiency is reported to be > 14 percent (1 AM1 sun). This is without an anti-reflection coating and does not account for the loss due to the contact area. The main advantage to this system is the improved minority carrier diffusion lengths obtained as compared to typical diffused-junction GaAs solar cell devices. The minority carrier properties were observed experimentally. The impurity profile was determined by capacitance measurements to be approximately linear and extending beyond the nominal depletion region boundary. The built-in electric field resulting from the grading in the quasi-neutral region was applied, for the first time, to the current mechanisms of a solar cell device. Dissert. Abstr.

SOLAR CELL HETEROJUNCTIONS INVOLVING N-CADMIUM SULFIDE AND CERTAIN P-TYPE SEMICONDUCTOR SINGLE CRYSTALS Ph.D. Thesis
Arienzo Maurizio 1979 214 p
Avail: Univ. Microfilms Order No. 8006969

The fabrication and testing of heterojunction photovoltaic solar cells of the type n-CdS/p-Ge, n-CdS/p-InP, n-CdS/p-GaAs and n-CdS/p-CdTe is described. The CdS layer was found to be single crystalline when it was grown on substrates whose lattice mismatch with CdS was less than 4%, i.e., in the case of growth on InP, GaAs and Ge. Analysis of the dark current characteristics revealed that in all of these heterojunction devices, there exists a low temperature, low bias voltage tunneling current. Analysis of the photovoltaic responses showed that they generally had respectable collection efficiencies; i.e., that the interface states did not act as recombination sites of photogenerated carries crossing the junction. The solar energy conversion efficiency is, however, strongly influenced by interface states through the open circuit voltage and the fill factor. A maximum conversion efficency without antireflection coating of 6.5% for n-CdS/p-InP under natural sunlight having an intensity of 74 mW/cm was observed. Dissert. Abstr.

N80-23767 Stanford Univ., Calif.
PROPERTIES OF SPUTTERED ITO/CdTe SOLAR CELLS Ph.D. Thesis
Francis Georges Courreges 1980 135 p
Avail: Univ. Microfilms Order No. 8011619

The properties of indium tin oxide/cadmium telluride (ITO/CdTe) solar cells prepared by RF sputtering of ITO on phosphorus-doped CdTe single crystals is investigated through measurements of dark and light current-voltage characteristics of ITO/CdTe heterojunctions and In/CdTe junctions and of surface photovoltage and photoluminescence of CdTe surfaces. An observed reduction in solar efficiency of ITO/CdTe solar cells with time and/or heat treatment is describable in terms of the change from a n(+)-ITO/n-CdTe/p-CdTe homojunction structure to a n(+)-ITO/p-CdTe heterojunction, characterized by high collection efficiency and poor rectifying properties. Dissert. Abstr.

CELL MODULE AND FUEL CONDITIONER DEVELOPMENT
D. Q. Hoover, Jr. Jan. 1980 58 p
(Contracts DEN3-161; DE-AI03-79ET-1272)
(NASA-CR-159828; DOE/NASA/0161-79/3; QR-1; Rept-80-9E6-MARED-R1) Avail: NTIS HC A04/MF A01

Components for the first 5 cell stack (no cooling plates) of the MK-2 design were fabricated. Preliminary specfications and designs for the components of a 23 cell MK-1 stack with four DIGAS cooling plates were developed. The MK-2 was selected as a bench mark design and a preliminary design of the facilities required for high rate manufacture of fuel cell modules was developed. Two stands for testing 5 cell stacks were built and design work for modifying existing stands and building new stands for 23 and 80 cell stacks was initiated. Design and procurement of components and materials for the catalyst test stand were completed and construction initiated. Work on the specifications of pipeline gas, tap water and recovered water and definition of equipment required for treatment was initiated. An innovative geometry for the reformer was conceived and modifications of the computer program to be used in its design were stated. R.E.S.

AUTOMATED ARRAY ASSEMBLY, PHASE 2 Final Report
Bernard G. Carbajal Nov. 1979 43 p refs Sponsored in part by DOE Prepared for JPL
(Contracts NAS7-100; JPL-954881)
(NASA-CR-153191; DOE/JPL-954881-79-8; JPL-9950-319; Rept-03-79-58) Avail: NTIS HC A03/MF A01 CSCL 10A

Tasks of scaling up the tandem junction cell (TJC) from 2 cm x 2 cm to 6.2 cm and the assembly of several modules using these large area TJC's are described. The scale-up of the TJC was based on using the existing process and doing the necessary design activities to increase the cell area to an acceptably large area. The design was carried out using available device models. The design was verified and sample large area TJCs were fabricated. Mechanical and process problems occurred causing a schedule slippage that resulted in contract expiration before enough large-area TJCs were fabricated to populate the sample tandem junction modules (TJM). A TJM design was carried out in which the module interconnects served to augment the

current collecting buses on the cell. No sample TJMs were assembled due to a shortage of large-area TJCs. R.E.S.

DEVELOPMENT OF PULSED PROCESSES FOR THE MANUFACTURE OF SOLAR CELLS Final Report, Apr. 1979
J. A. Minnucci Apr. 1979 238 p refs Sponsored in part by DOE
(Contract JPL-954786)
(NASA-CR-153188; DOE/JPL-954786-79/02; JPL-9950-324; FR-79-10052) Avail: NTIS HC A11/MF A01 CSCL 10A

Low-energy ion implantation processes for the automated production of silicon solar cells were investigated. Phosphorus ions at an energy of 10 keV and dose of 2 x 10 to the 15th power/sq cm were implanted in silicon solar cells to produce junctions, while boron ions at 25 keV and 5 x 10 to the 15th power were implanted in the cells to produce effective back surface fields. An ion implantation facility with a beam current up to 4 mA and a production throughput of 300 wafers per hour was designed and installed. A design was prepared for a 100 mA, automated implanter with a production capacity of 100 MW sub e/sq cm per year. Two process sequences were developed which employ ion implantation and furnace or pulse annealing. A computer program was used to determine costs for junction formation by ion implantation and various furnace annealing cycles to demonstrate cost effectiveness of these methods. R.E.S.

(NASA-CR-153194; DOE/JPL-955640-80/1; JPL-9950-329; QPR-10073-01; QR-1) Avail: NTIS HC A02/MF A01 CSCL 10A

Experiments were completed which indicate that single-pulse, liquid-phase epitaxial regrowth is the optimum technique for pulsed electron beam annealing of ion implantation damage in silicon wafers. An electron beam which covers the entire area of the wafer was chosen for the solar cell processor. Beam control experiments to improve beam propagation and to test the concept of partial space charge and current neutralization were initiated. The electrical parameters of the pulsed electron beam subsystem were chosen on the basis of computer calculations and past experience in pulsed electron accelerator design and operation. The pulder, designated SPI-PULSE 7000, is designed to anneal 10 cm diameter silicon wafers at a rate of 30 per minute. The preliminary design of the major elements of the SPI-PULSE 7000 was completed, and the detailed design of many of the components begun. These elements include a capacitive energy store and charging system, an electron accelerator, a beam control system, a wafer handling system and pressure and vacuum assemblies. R.E.S.

SOLAR HOT WATER SYSTEM INSTALLED AT QUALITY INN, KEY WEST, FLORIDA Final Report
Apr. 1980 25 p Sponsored in part by NASA
(Grant EG-77-G-01-1633)
(NASA-CR-161434) Avail: NTIS HC A02/MF A01 CSCL 10A

The solar energy hot water system installed in the Quality Inn, Key West, Florida, which consists of four buildings is described. Three buildings are low-rise, two-story buildings containing 100 rooms. The fourth is a four-story building with 48 rooms. The solar system was designed to provide approximately 50 percent of the energy required for the domestic hot water system. The solar system consists of approximately 1400 square feet of flat plate collector, two 500 gallon storage tanks, a circulating pump, and a controller. Operation of the system was begun in April 1978, and has continued to date with only three minor interruptions for pump repair. In the first year of operation, it was determined that the use of the solar facility resulted in forty percent fuel savings. R.E.S.

SOLAR HEATING SYSTEM INSTALLED AT BLAKEDALE PROFESSIONAL CENTER, GREENWOOD, SOUTH CAROLINA Final Report
Mar. 1980 33 p Sponsored in part by NASA
(Contract EX-76-C-01-2389)
(NASA-CR-161435) Avail: NTIS HC A03/MF A01 CSCL 10B

Information on the solar heating system installed at the Blakedale Professional Center, in Greenwood, South Carolina is presented. The information consists of site and building description, solar system description, performance evaluation, system problems and installation drawings. The solar system was designed to provide approximately 85 percent of the building's heating requirements. The system was installed concurrently with building construction and heats 4,440 square feet of the building. There are 954 square feet of liquid flat plate collectors that are proof-mounted and have a drain-down system to protect the collectors from freezing. A 5,000 gallon steel, polyurethane insulated tank buried underground provides storage. The system was fully instrumented for performance evaluation and integrated into the National Solar Data Network. R.E.S.

REDOX STORAGE SYSTEMS FOR SOLAR APPLICATIONS
Norman H. Hagedorn and Lawrence H. Thaller 1980 28 p refs Proposed for presentation at Power Sources Conf., Brighton, England, 15-18 Sep. 1980
(Contract EF-77-A-31-1002)
(NASA-TM-81464; DOE/NASA/1002-80/5; E-383) Avail: NTIS HC A03/MF A01 CSCL 10A

The NASA Redox energy storage system is described. The system is based on soluble aqueous iron and chromium chloride redox couples. The needed technology advances in the two elements (electrodes and membranes) that are key to its technological feasibility have been achieved and system development has begun. The design, construction, and test of a 1 kilowatt system integrated with a solar photovoltaic array is discussed. R.E.S.

THE OPTIMIZATION AIR SEPARATION PLANTS FOR

COMBINED CYCLE MHD-POWER PLANT APPLICATIONS
Albert J. Juhasz, Helmut Springmann, and Ralph Greenberg 1980 11 p refs Presented at the 7th Intern. Conf. on MHD Elec. Power Generation, Cambridge, Mass., 16-20 Jun. 1980
(Contracts DEN3-165; EF-77-A-01-2674)
(NASA-TM-81510; DOE/NASA/2674-80/10) Avail: NTIS HC A02/MF A01 CSCL 10B

Some of the design approaches being employed during a current supported study directed at developing an improved air separation process for the production of oxygen enriched air for magnetohydrodynamics (MHD) combustion are outlined. The ultimate objective is to arrive at conceptual designs of air separation plants, optimized for minimum specific power consumption and capital investment costs, for integration with MHD combined cycle power plants. THE EFFECT OF CATALYST LENGTH AND DOWNSTREAM REACTOR DISTANCE ON CATALYTIC COMBUSTOR PERFORMANCE
David Anderson 1980 24 p refs Presented at the 4th Workshop on Catalytic Combust., Cincinnati, 14-15 May 1980; sponsored by EPA
(Contract EC-77-A-31-1040)
(NASA-TM-81475; DOE/NASA/1040-80/14; E-409) Avail: NTIS HC A02/MF A01 CSCL 10B

A study was made to determine the effects on catalytic combustor performance which resulted from independently varying the length of a catalytic reactor and the length available for gas-phase reactions downstream of the catalyst. Monolithic combustion catalysts from three manufacturers were tested in a combustion test rig with no. 2 diesel fuel. Catalytic reactor lengths of 2.5 and 5.4 cm, and downstream gas-phase reaction distances of 7.3, 12.4, 17.5, and 22.5 cm were evaluated. Measurements of carbon monoxide, unburned hydrocarbons, nitrogen oxides, and pressure drop were made. The catalytic-reactor pressure drop was less than 1 percent of the upstream total pressure for all test configurations and test conditions. Nitrogen oxides and unburned hydrocarbons emissions were less than 0.25 g NO2/kg fuel and 0.6 g HC/kg fuel, respectively. The minimum operating temperature (defined as the adiabatic combustion temperature required to obtain carbon monoxide emissions below a reference level of 13.6 g CO/kg fuel) ranged from 1230 K to 1500 K for the various conditions and configurations tested. The minimum operating temperature decreased with increasing total (catalytic-reactor-plus-downstream-gas-phase-reactor-zone) residence time but was independent of the relative times spent in each region when the catalytic-reactor residence time was greater than or equal to 1.4 ms. R.E.S.

SUMMARY AND EVALUATION OF THE PARAMETRIC STUDY OF POTENTIAL EARLY COMMERCIAL MHD POWER PLANTS (PSPEC)
Peter J. Staigner and John M. Abbott 1980 11 p refs Presented at the 7th Intern. Conf. on Magnetohydrodyn. Elec. Generation, Cambridge, Mass., 16-20 Jun. 1980; sponsored by the Symp. on the Eng. Aspects of Magnetohydrodynam., Inc.
(Contract EF-77-A-31-2674)
(NASA-TM-81497; DOE/NASA/2674-80/9; E-434) Avail: NTIS HC A02/MF A01 CSCL 10B

Two parallel contracted studies were conducted. Each contractor investigated three base cases and parametric variations about these base cases. Each contractor concluded that two of the base cases (a plant using separate firing of an advanced high temperature regenerative air heater with fuel from an advanced coal gasifier and a plant using an intermediate temperature metallic recuperative heat exchanger to heat oxygen enriched combustion air) were comparable in both performance and cost of electricity. The contractors differed in the level of their cost estimates with the capital cost estimates for the MHD topping cycle and the magnet subsystem in particular accounting for a significant part of the difference. The impact of the study on the decision to pursue a course which leads to an oxygen enriched plant as the first commercial MHD plant is described. R.E.S.

THE AERODYNAMICS OF AXIAL FLOW WIND POWER TURBINES
W. J. VanderElst Jun. 1979 37 p refs
(CSIR-ME-1619; ISBN-0-7988-1463-2) Avail: NTIS HC A03/MF A01

A general analysis of the aerodynamics of wind power turbines of the axial flow type is presented. The design parameters appear in nondimensional form and are presented graphically. The theory is applicable to any type of wind power generator, including slow running windmills normally used for powering water pumps as well as fast running machines which are suitable for the generation of electric power. NAVAL FACILITY ENERGY CONVERSION PLANTS AS RESOURCE RECOVERY SYSTEM COMPONENTS Interim Report, period ending Oct. 1979
Arlie G. Capps Port Hueneme, Calif. Civil Engineering Lab. Jan. 1980 68 p
(Contract N00123-78-C-0868)
(AD-A081232; CEL-CR-80-002) Avail: NTIS HC A04/MF A01 CSCL 21/4

This interim report addresses concepts for recovering energy from solid waste by using Naval facilities steam plants as principle building blocks of candidate solid waste/resource recovery systems at Navy installations. The major conclusions of this portion of the project are: although it is technically feasible to adapt Navy energy conversion systems to fire Waste Derived Fuels (WDF) in one or more of its forms, the optimal form selected should be a site-specific total system; near- to intermediate-term programs should probably continue to give first consideration to waterwall incinerators and to the cofiring of solid WDF in coal-capable plants; package incinerators and conversions of oil burning plants to fire a fluff form of solid waste fuel may be the options with the greatest potential for the intermediate term because waterwalls would be uneconomical in many small plants and because the majority of medium-sized oil-burning plants will not be converted to burn coal; and pyrolytic processes to produce gaseous and liquid fuels have not been sufficiently developed as yet to be specified for commerical operation. LiSi AND LiB AS ANODES IN CHLOROALUMINATE THERMAL BATTERIES
Robert L. Vaughn Jan. 1980 22 p refs
(AF Proj. 2303)
(AD-A081300; FJSRL-TR-80-0002) Avail: NTIS HC A02/MF A01 CSCL 10/3

Lithium silicon (40 weight percent Li) and lithium boron were studied as anode materials in chloroaluminate thermal cells and were compared with lithium aluminum. Lithium boron anodes were tested only at a single temperature (200 C) because of low availability whereas lithium silicon was studied over the temperature range 175 to 275 C. The current density range was 15 to 150 mA/sq cm. The results showed that lithium silicon behaved like lithium aluminum, with linear polarization over the current densities studied. The internal resistances were

the same at all temperatures. On the other hand, lithium boron displayed an activation overpotential at current densities less than 50 mA/sq cm. At higher current densities, an internal resistance of less than 0.19 omega was indicated for the lithium boron-anode cells. This study shows that LiSi offers no advantage over lithium aluminum as an anode for chloroaluminate thermal cells. However, LiB promises to be a superior anode material at high current densities. PHOTOVOLTAIC PROPERTIES OF METAL-MEROCYANINE-TiO2 SANDWICH CELLS Ph.D. Thesis
T. A. Skotheim Aug. 1979 150 p refs
(Contract W-7405-eng-48)
(LBL-9916) Avail: NTIS HC A07/MF A01

Photocurrent generation in thin films of merocyanine photosensitizing dyes sandwiched between an n-type semiconductor and a metal overlayer was studied using photovoltaic techniques. Titanium dioxide single crystal, doped n-type, was used as the semiconductor and a semitransparent Au film as a metal overlayer. A theoretical model was developed to explain the photovoltaic properties. The model assumes that the principal route for the formation of charge carriers is via singlet excitons diffusing to the merocyanine-TiO2 interface followed by dissociation of the excitons into electron-hole pairs, the electrons being injected into the TiO2 conduction band and the holes into the merocyanine. The model also incorporates field dependence of the quantum efficiency for charge generation and is strongly supported by a variety of steady state and kinetic measurements. DOE

MECHANISM OF ENERGY CONVERSION AND TRANSFER IN BIOLUMINESCENCE Final Report
Milton J. Cormier 1979 20 p refs
(Contract EY-76-S-09-0635)
(SRO-635-7) Avail: NTIS HC A02/MF A01

Bioluminescence in the sea pansy, Renilla reniformis, a marine anthozoan coelenterate, is a complex process involving the participation of three proteins specfic to anthozoan coelenterate-type systems. These are: (1) the luciferin binding protein, (2) the enzyme luciferase, and (3) the green-fluorescent protein. Each of these were purified and characterized and the structure of luciferin confirmed by synthesis. The Renilla bioluminescence system is the first radiationless energy transfer system the individual components of which have been purified to homogeneity, characterized, and then reassembled in vitro with restoration of the energy transfer function. APPLICATION AND DESIGN STUDIES OF COMPRESSED-AIR ENERGY STORAGE FOR SOLAR APPLICATIONS Final Report
G. T. Flynn and J. L. Nash-Webber 28 Sep. 1979 118 p refs
(Contract EX-76-A-01-2295-029)
(CAES-7) Avail: NTIS HC A06/MF A01

Adiabatic compressed air energy storage (CAES), in which both the heat of compression and the compressed air stored separately, was studied. The applicability of this technology to solar power systems was examined. The basic thermodynamics of ideal single and two stage adiabatic CAES is reviewed. Generic single stage and two stage types are discussed, and the efficiency and mass flow rate as a function of storage pressure and stage pressure ratios were investigated. The performance and cost of available turbomachinery for the single and two stage adiabatic systems are examined. DOE

NOAA'S ROLE IN THE SOLAR ENERGY PROGRAM Annual Report, 1978
Aug. 1979 244 p refs
(DOE/ET-0110) Avail: NTIS HC A11/MF A01

The efforts of the National Oceanic and Atmospheric Administration toward monitoring and documenting the USA solar radiation and related weather data are reported. A format to be used for transfer and processing of related solar data sets is presented. Solar radiation maps of the U.S. for total and direct radiation on a monthly and annual basis are presented and

discussed. A section on solar and climatic data applied to subdivisions of the U.S. that are quasi-homogeneous in solar radiation heating demand and topography is included. A listing of the periods of record of all available wind observations in the National Climatic Center's meteorological archives is given. The computational of extra-terrestrial solar radiation, solar evaluation angle, and true solar time of sunrise and sunset is described. Also, research on the effects of aerosols and clouds on solar radiation is described. DOE

THERMAL FRACTURE EFFECTS IN GEOTHERMAL ENERGY EXTRACTION
Ruth B. Demuth and Francis H. Harlow Nov. 1979 148 p refs
(Contract W-7405-eng-36)
(LA-7963) Avail: NTIS HC A07/MF A01

Heat and water exchange between the primary crack and a lateral thermal fracture are analyzed by means of numerical modeling on a high-speed computer. Three dimensional heat flow in the rock is coupled to a two dimensional approximation for the time-varying convective patterns that result from both forced flow and buoyancy. The physical and mathematical bases for the study are described together with the numerical technique for solution. Three versions of the computer code are listed and some results of representative calculations are included. DOE

N80-23796# United Technologies Research Center, East Hartford, Conn.
PARAMETRIC PERFORMANCE EVALUATION AND TECHNICAL ASSESSMENT OF ADIABATIC COMPRESSED AIR ENERGY STORAGE SYSTEMS Final Report
R. D. Lessard and W. A. Blecher Oct. 1979 157 p refs
Sponsored by Elec. Power Res. Inst.
(EPRI Proj. 1199-1)
(EPRI-EM-1188) Avail: NTIS HC A08/MF A01

An adiabatic compressed air energy storage (ACAES) system, an advanced compressed air energy storage system concept which features thermal energy storage (TES) is discussed. The intermediate pressure hybrid ACAES system (an ACAES system wherein the heat of compression is transferred to the TES at a pressure level substantially below the cavern air storage pressure and which utilizes combustion of some fossil fuel prior to expansion to raise the turbine inlet temperature) was examined for near term commercialization. The level of performance and the level of turbomachinery technology required of an intermediate-pressure hybrid ACAES system are evaluated. DOE

FIXED SITE HYDROGEN STORAGE. 1: APPLICATIONS IMPACT
J. J. Iannucci and S. L. Robinson 1979 11 p refs Presented at the 2nd Intern. Conf. on Alternative Energy Sources, Miami Beach, Fla., 10 Dec. 1979
(Contract EY-76-C-04-0789)
(SAND-79-8647; CONF-791204-10) Avail: NTIS HC A02/MF A01

The potential applications and requirements for fixed site storage in a scenario of wide spread hydrogen use are examined and quantified. An envisioned hydrogen production/distribution/end-use cycle is scrutinized to identify the storage needs for both continuous and intermittent sources including solar. The most pressing need for storage is found to be at the distribution point, in concurrence with current natural gas practice. Caverns and similar underground storage techniques are shown to be the most promising modes due to their low cost relative to all other options examined. Since a large volume of natural gas storage is presently in service, a pressing need to develop fixed site hydrogen storage technology (beyond the conversion of this underground storage to hydrogen) has not been identified. DOE

CONVERSION SYSTEM OVERVIEW ASSESSMENT. VOLUME 2: SOLAR-WIND HYBRID SYSTEMS
T. S. Jayadev, J. Henderson, and C. Bingham Aug. 1979 34 p refs
(Contract EG-77-C-01-4042)
(SERI/TR-35-078-Vol-2) Avail: NTIS HC A03/MF A01

Solar-wind hybrid systems are discussed. It is shown that there are large areas in the United States where solar and wind resources are comparable in magnitude and there are diurnal and seasonal complementarities which offer the potential for cost-effective hybrid systems. There are also distinct engineering features of the two conversion technologies. Electric power generation from wind is straightforward and cost-effective, whereas solar thermal conversion to generate heat is more cost-effective than to generate electricity. Examples of hybrid systems utilizing these features on total energy application are presented. DOE

DEVELOPMENT OF A SOLAR THERMAL RECEIVER FOR HIGH TEMPERATURE APPLICATIONS
M. Bohn and G. Bessler Nov. 1979 7 p refs Presented at the Semiann. Conf. for Adv. Solar Thermal Tech., Phoenix, Ariz., 11 Dec. 1979
(Contract EG-77-C-02-4042)
(SERI/TP-333-485; CONF-791221-1) Avail: NTIS HC A02/MF A01

A thermal receiver for point focus collectors is described. The receiver uses as a buffer between the cavity surface and the heat transfer fluid a thermal mass, which with a very small temperature drop penalty smooths the flux distribution to eliminate hot spots. The design of the receiver enables significant spillage flux at the receiver to be used. Thus, lower quality optics can be employed in applications not requiring very high temperatures. Design and construction features of the receiver are presented and the testing program is described. DOE

N80-23801# Los Alamos Scientific Lab., N. Mex.
ENERGY STORAGE TECHNOLOGY-ENVIRONMENTAL

IMPLICATIONS OF LARGE SCALE UTILIZATION
M. C. Krupka, J. E. Moore, W. E. Keller, G. A. Baca (Los Alamos Tech. Assoc., Inc., N. Mex.), R. I. Brasier (Los Alamos Tech. Assoc., Inc., N. Mex.), and W. S. Benneth (Los Alamos Tech. Assoc., Inc., N. Mex.) 1979 20 p refs Presented at the 2d Intern. Alternative Energy Sources Conf., Miami Beach, Fla., 10-13 Dec. 1979
(Contract W-7405-eng-36)
(LA-UR-79-3098; CONF-791204-4) Avail: NTIS HC A02/MF A01

Environmental impacts for several energy storage technologies have been identified. State-of-the-art control technology options were similarly identified. Recommendations for research and development on new control technology were made where present controls were either deemed inadequate or non-existent. Specifically, the energy storage technologies under study included: advanced lead-acid battery, compressed air, underground pumped hydroelectric, flywheel, superconducting magnet and various thermal systems (sensible, latent heat and reversible chemical reaction). In addition, a preliminary study was conducted on fuel cell technology. Although not strictly classified as an energy storage system, fuel cells in conjunction with product recycling units can serve an energy storage function. A very large number of potential environmental impacts can be identified for all o. these technologies. However, not all are of primary importance. Detailed discussions of a number of environmental impacts from the latest LASL study as they relate to primarily operational situations are emphasized. In addition, a brief discussion on new application for energy storage technologies and the additional costs of controls to be used for mitigation of specific impacts are also presented. DOE

(Contract W-7405-eng-36)
(LA-UR-79-3256; CONF-791216-1) Avail: NTIS HC A02/MF A01

The Hot Dry Rock Geothermal Energy Program is described. The system, operation, results, development program, environmental implications, resource, economics, and future plans are discussed. DOE

N80-23803# New Zealand Energy Research and Development Committee, Auckland.
ELECTRICITY FROM REFUSE
M. White 1979 51 p refs
(NZERDC-44; ISSN-0110-1692) Avail: NTIS HC A04/MF A01

The conversion of refuse to electricity for Auckland involves the combustion of refuse directly or as a refuse-derived fuel to release heat energy, which in turn is converted to high-pressure steam for driving steam turbogenerators. Domestic/commercial collected refuse, privately deposited domestic refuse and industrial/commercial refuse are used. Only those technologies are considered that have been basically proven by commercial operation and systems designed to make use, whenever possible, of existing plant and equipment. The following options are examined for close technical and economic assessment: mass burning in sloping grate boiler plant, semi-suspension combustion boiler plant, supplementary firing of a refuse-derived fuel and refuse-fueled power station using semi-suspension combustion boiler plant. Extensive data are compiled on: refuse from the Auckland urban area; design of systems; environmental and technical aspects. DOE

N80-23804# Los Alamos Scientific Lab., N. Mex.
USE OF ADAPTIVE OPTIMAL CONTROL TO PROVIDE ENERGY CONSERVATION IN LARGE BUILDINGS
Donald R. Ferris and Dennis E. Miller (Johnson Controls, Inc., Milwaukee, Wis.) 1979 9 p refs Presented at 18th IEEE Conf. on Decision and Control, Fort Lauderdale, Fla., 12 Dec. 1979
(Contract W-7405-eng-36)
(LA-UR-79-3354; CONF-791227-1) Avail: NTIS HC A02/MF A01

The use of an adaptive linear regulator approach for controlling heating, ventilating, and air conditioning systems in large buildings is discussed. The control manifestations of this approach are compared with those found in conventional applications. The salient features of the approach are discussed, and simulation results are presented. Implementation is discussed, and economic estimates for commercial use of this approach also presented. DOE

PROPOSITION ON ENERGY ANALYSIS AND ECONOMIC EFFICIENCY
Donald I. Hertzmark Oct. 1979 22 p refs
(Contract EG-77-C-01-4042)
(SERI/RR-51-332) Avail: NTIS HC A02/MF A01

Analytical results of an attempt to simultaneously optimize economic and thermodynamic efficiency are presented and discussed. The attempt to impose complete mathematical rationality and consistency on the pricing of energy commodities failed since it was not possible to consistently weigh purely physical efficiency measures, much less social factors. Nevertheless, the use of both material balance and entropy analysis is valuable for evaluating nonmarket decisions, as well as identifying opportunities for process improvements. DOE

N80-23806# Sandia Labs., Livermore, Calif.
HELIOSTAT DESIGN COST/PERFORMANCE TRADEOFFS
Miriam J. Fish and T. A. Dellin Nov. 1979 50 p refs
(Contracts EY-76-C-04-0789; DE-AC04-76DP-00789)
(SAND-79-8248) Avail: NTIS HC A03/MF A01

The heliostat field comprisbs the most expensive subsystem of a solar central receiver power plant. Cost reductions might be achieved by either total heliostat redesign or component substitution in existing design. The value of changing any of several design specifications, in the current baseline glass/metal heliostat is discussed. Results are quantified in terms of the breakeven cost; i.e., the cost of a new design which will yield the same total system energy cost as the baseline system. Changes in mirror reflectivity, pointing accuracy, surface quality, canting and focusing strategy, heliostat size, and stow requirements were evaluated. DOE

N80-23807# Los Alamos Scientific Lab., N. Mex.
RESIDENTIAL PASSIVE SOLAR SYSTEMS: REGIONAL SENSITIVITY TO SYSTEM PERFORMANCE COSTS, AND ALTERNATIVE PRICES
C. Kirschner, S. Ben-David, and F. Roach 1979 32 p Presented at the 2nd Miami Intern. Conf. on Alternatives Energy Sources, Miami Beach, Fla., 10-13 Dec. 1979
(Contract W-7405-eng-36)
(LA-UR-79-3390; CONF-791204-12) Avail: NTIS HC A03/MF A01

The economic potential of two passive space heating configurations were analyzed. These were a masonary thermal storage wall (trombe) and a direct gain system - both with night insulation. A standard tract home design for each of the two passive systems was used throughout the analysis to allow interregional comparisons. The economic performance of these two systems was evaluated on a regional basis (223 locations) throughout the United States. A sensitive analysis was conducted on two conventional energy types (electricity and natural gas) to determine the impact of alternative fuel price escalation rates and solar costs upon feasibility of the two solar systems. Cost goals for solar system prices were established under one set of future fuel prices and stated economic conditions. DOE

(Contract EY-76-C-04-0789)
(SAND-79-8181) Avail: NTIS HC A07/MF A01
The feasibility of two concepts for cleaning heliostat reflectors are investigated and the results are itemized. In addition, the design and construction of a reflectometer and wind tunnel, and the performance of some dust accumulation studies are also discussed. DOE

N80-23810# California Univ., Berkeley. Lawrence Berkeley Lab. Materials and Molecular Research Div.
METAL FOILS FOR DIRECT APPLICATION OF ABSORBER COATINGS ON SOLAR COLLECTORS
Carl M. Lampert Aug. 1979 19 p refs Presented at the 2nd Am. Electroplaters Soc. Symp. on Coatings for Solar Collectors, St. Louis, 16-17 Oct. 1979
(Contract W-7405-eng-48)
(LBL-9324-Rev; CONF-791021-1-Rev) Avail: NTIS HC A02/MF A01
The basic materials and processing associated with the production of coated metal foils for solar collector absorber surfaces are discussed. Also covered are details of heavier metal strips for direct fabrication of solar collectors. Techniques including bonding methods and the use of adhesive are surveyed. Commercial solar foil manufacturers are covered along with the research efforts in this area. In conclusion, advantages and disadvantages are outlined, with specific recommendations. DOE

LOW-COST MIRROR CONCENTRATOR BASED ON DOUBLE-WALLED METALLIZED, TUBULAR FILMS Semiannual Technical Progress Report, 20 Aug. 1978 - 19 Feb. 1979
J. W. Leffingwell, G. L. Ball, III, J. L. Schuendeman, and T. A. Orofino 30 Mar. 1979 44 p refs
(Contract EM-78-C-04-4227)
(ALO-4227-12; SAPR-2) Avail: NTIS HC A03/MF A01
The development of a potentially, low cost, air inflatable, tubular plastic, nontracking 3X solar collector is described. The design employs joined truncated cylindrical sections which reduce both cover and mirror material requirements by 40% compared with a conventional cylindrical design. Aluminum foil-plastic laminates were selected as an alternative to aluminized polyester films because of their low cost, ease of fabrication, good durability, high strength, and acceptable reflectivity. Specially UV-stabilized and polyester scrim reinforced flexible polyvinyl chloride film was selected for use as the outer transparent cover material because of its mechanical and optical durability, acceptable transmission characteristics and its potential low cost. STUDY AND ANALYSIS OF A LOW COST CEMENT BONDED FLAT PLATE SOLAR COLLECTOR Final Report
Jan. 1979 136 p refs
(Contract EG-77-04-4122)
(ALO-4122-T1) Avail: NTIS HC A07/MF A01
A flat plate collector was designed and tested using low cost materials. This collector absorber plate included copper circulating tubes bonded to a flat sheet of conductive material using high service temperature, low outgassing, high conductivity adhesives. A series of candidate adhesive were evaluated. Structural and thermal tests were performed using galvanized sheet steel collector plates and aluminum collector plates with copper tubes to determine the conductivity of bond joints. The structural integrity of bond joints was evaluated under relative thermal expansion forces at various temperatures (ranging from 35 C to 300 C). Thermal cycling tests were conducted to evaluate fatigue of bond joints and to evaluate the degradation of thermal conductivity of these bond joints. A cost/performance summary was made (using F-chart) to determine the potential cost sevings realized compared with conventional systems. DOE

N80-23817# Monsanto Research Corp., Dayton, Ohio.
NON-CONCENTRATING COLLECTORS FOR SOLAR HEATING APPLICATIONS (MEDIUM TEMPERATURE AIR HEATERS BASED ON DURABLE TRANSPARENT FILMS) Final Report, 30 Sep. 1977 - 31 Oct. 1978
J. W. Leffingwell, J. L. Schwendeman, G. L. Ball, and T. A. Orofino Mar. 1979 143 p refs
(Contract EG-77-C-04-4147)
(ALO-4147-T1; MRC-DA-867) Avail: NTIS HC A07/MF A01
A special UV-stablized and scrim-reinforced flexible photovoltaic conversion film was developed, characterized, and tested on an air solar heater. Solar energy transmission of early

precontract 20/mil thick film was determined to be about 83% after two months outdoor Florida exposure, dropping to 78% after two years. Outdoor exposure and artificial UV aging tests indicate that a 10 year lifetime could be possible. The fabricated solar heater had a lower efficiency than predicted from computer modeling (43% for 129 F output with 62 F temperature rise at an ambient temperature of 60 F) suggesting design problems which could most easily be overcome by changing from a double-glazed non-selective absorber collector to a single-glazed-selective absorber heater. DOE

N80-23818*# Thermo Electron Corp., Waltham, Mass.
DOE/JPL ADVANCED THERMIONIC TECHNOLOGY PROGRAM Progress Report, Apr. - Jun. 1979
1979 73 p refs
(Contracts JPL-95509; EY-76-C-02-3056)
(NASA-CR-163134; COO-3056-41; PR-39) Avail: NTIS HC A04/MF A01 CSCL 10A

Progress made in different tasks of the advanced thermionic technology program is described. The tasks include surface and plasma investigations (surface characterization, spectroscopic plasma experiments, and converter theory); low temperature converter development (tungsten emitter, tungsten oxide collector and tungsten emitter, nickel collector); component hardware development (hot shell development); flame-fired silicon carbide converters; high temperature and advanced converter studies; postoperational diagnostics; and correlation of design interfaces. DOE

N80-23819# Sandia Labs., Albuquerque, N. Mex.
NON-INVERTING HELIOSTAT STUDY
J. B. Blackmon Jul. 1979 101 p refs Prepared in cooperation with McDonnell-Douglas Corp.
(Contract EY-76-C-04-0789)
(SAND-78-8190; MDC-G7876) Avail: NTIS HC A06/MF A01

Implications of employing a non-inverting heliostat design with a lower capital cost relative to an inverting design are considered from three standpoints: (1) effects of dust buildup, corresponding cleaning frequencies, and resultant cleaning costs; (2) effects of hail impact; and (3) reflected beam safety issues. It is concluded that elimination of the inverting stow hardware and addition of reflector provides a direct subsystem cost savings. DOE

PRELIMINARY DEFINITION AND CHARACTERIZATIONS OF SOLAR INDUSTRIAL PROCESS HEAT TECHNOLOGY AND MANUFACTURING PLANT FOR THE YEAR 2000
Richard T. Meyer and Ted Prythero 1979 7 p Presented at the Solar Ind. Process Heat Conf., Oakland, Calif., 31 Oct. - 2 Nov. 1979
(Contract W-7405-eng-36)
(LA-UR-79-2812; CONF-791024-4) Avail: NTIS HC A02/MF A01

The findings and projections of this preliminary definition and characterization of a solar industrial process heat technology and manufacturing plant for the year 2000 indicate that the technology and the manufacturing would be significantly more sophisticated and expanded than exists in the solar industry today. The solar process heat technology is defined to be a parabolic trough collector system and to utilize a combustion of the more advanced materials and components under current development. The manufacturing operations are projected to include glass-making, silvering, electroplating and plastic-forming, which, while standard industrial procedures, will be additions to or expansions of existing solar manufacturing plants. These integrated operations for the year 2000 solar facility will introduce important environmental residuals which will need to be managed and controlled to satisfy local, state, and federal environmental standards. DOE

SUMMARY OF THE RESEARCH AND DEVELOPMENT EFFORT ON OPEN-CYCLE COAL-FIRED GAS TURBINES
M. E. Lackey Oct. 1979 126 p refs
(Contract W-7405-eng-26)
(ORNL/TM-6253) HC A07/MF A01

Extensive experience gained with gas turbines operating not only with coal as fuel but also with dusty inlet air and with dirty fuels (such as heavy oils and blast furnace gas) as well as petroleum catalytic cracking units was reviewed. All this experience indicates that the particulate content of the hot gases fed to the turbine must be kept to less than approximately 1 ppM to keep turbine bucket erosion to an acceptable level for turbine inlet temperatures of 1500 F or more. It is shown that cyclone separators can be used to reduce the particulate content to as low as 100 ppM under the best conditions. The only effective was found to reduce the particulate content of blast furnace gas and gas from coal gasification units to the 1 ppM required for a high temperature gas turbines is to cool the gas and pass it through a two-stage water scrubber or equivalent before burning it. DOE

N80-23822# California Univ., Livermore. Lawrence Livermore Lab.
APPLICATION OF SHALLOW SOLAR PONDS FOR INDUSTRIAL PROCESS HEAT: CASE HISTORIES
Alan B. Casamajor 4 May 1979 13 p refs Presented at the Intern. Solar Energy Soc., Atlanta, 28 May - 1 Jun. 1979 Submitted for publication
(Contract W-7405-eng-48)
(UCRL-82367; CONF-790541-57) Avail: NTIS HC A02/MF A01

The shallow solar pond collector system is approaching commercialization. Three prototype or demonstration projects, Sohio Petroleum Company, Sweet Sue Kitchens, and Fort Benning, are described. A critique of each project points out the significant factors that affect the individual projects and shallow-solar pond technology in general. Particular attention is drawn to problems encountered and solutions proposed. Finally, possible marketing organization and strategies are discussed. DOE

NUMERICAL ANALYSIS OF TEMPERATURE AND FLOW EFFECTS IN A DRY, TWO-DIMENSIONAL, POROUS-MEDIA RESERVOIR USED FOR COMPRESSED AIR ENERGY STORAGE
L. E. Wiles Oct. 1979 87 p refs
(Contract EY-76-C-06-1830)
(PNL-3047) Avail: NTIS HC A05/MF A01

The hydrodynamics and thermodynamic responses of a compressed air energy storage dry porous media reservoir subjected to simulated air mass cycling were investigated to develop design guidelines for the efficient and stable operation of the air storage reservoir. The analysis and results obtained by two dimensional modeling of dry reservoirs are presented. While the fluid/thermal response of the underground system is dependent on many parameters, the two-dimensional model was applied only to those parameters that entered the analysis by virtue of inclusion of the vertical dimension. In particular, the parameters or responses that were quantified or characterized include well bore heat transfer, heat losses to the vertical boundaries of the porous zone, gravitationally induced flows, producing length of the wellbore, and the effects of nonuniform permeability. The analysis of the wellbore heat tranfer included consideration of insulation, preheating (bubble development with heated air), and air mass flow rate. DOE

N80-23824# Mechanical Technology, Inc., Latham, N. Y.
APPLICATION OF MAGNETIC SUSPENSIONS AND FLUID FILM BEARINGS TO ENERGY STORAGE FLYWHEELS
M. Eusepi, L. Martin, and A. Ray Mar. 1979 168 p refs
(Contract EY-76-C-04-0789)
(SAND-79-7007) Avail: NTIS HC A08/MF A01

The design of a suspension system for the support of a 10 kWh energy storage flywheel, with scaling equations and curves suitable for extending the 10 kWh design to other flywheel sizes up to 100 kWh is presented. The design of a test vehicle suitable for evaluating the final suspension design is included. The first phase of this effort was a concept study in which fluid film bearings for both radial and axial load support and magnet suspensions were examined in several combinations to determine suitability. The concept study is described and includes discussions on flywheel sizing, journal and thrust bearing sizing, magnetic suspension sizing and geometric arrangements. DOE

OFF-PEAK ELECTRIC AUXILIARY HEAT FOR SOLAR AIR-HEATING SYSTEMS Final Report, 1 Jun. 1977 - 31 Dec. 1978
Thomas B. Jones and Paul J. Wilbur Jan. 1979 51 p refs
(Contract EG-77-S-02-4516)
(COO-4516-1) Avail: NTIS HC A04/MF A01

The performance of various solar auxiliary heating system options was examined by means of computer simulation. A storage reservoir which is separate from the solar reservoir was found to be preferable. Performance was generally not found to be sensitive to the time at which off-peak energy is available. Control schemes that predict energy requirements for a forthcoming on-peak period and account for energy in solar storage are preferable and a reservoir heater that can be staged so heating can be accomplished over the full duration of the on-peak period to supply different levels of energy is desirable. The system installed in a solar house for testing is described. DOE

N80-23828# Oak Ridge National Lab., Tenn.
FOSSIL ENERGY PROGRAM Progress Report, Oct. 1979
L. E. McNeese Dec. 1979 79 p refs
(Contract W-7405-eng-26)
(ORNL/TM-7144) Avail: NTIS HC A05/MF A01

The utilization of coal and other fossil fuel alternatives to oil and gas as sources of clean energy is addressed. Coal conversion development, materials engineering, a coal equipment test program, an atmospheric fluid bed combustor for cogeneration, engineering studies and technical support, process and program analysis, environmental assessment studies, magnetic beneficiation of dry pulverized coal, technical support to a fluid bed combustion program, coal cogeneration/district heating plant assessment, chemical research and development, and technical support to major liquefaction projects are specifically discussed. DOE

SELENIDE ISOTOPE GENERATOR FOR THE GALILEO MISSION: COPPER/WATER AXIALLY-GROOVED HEAT PIPE TOPICAL REPORT
N. P. Strazza 30 Jun. 1979 136 p refs
(Contracts ET-78-C-01-2865; DE-AC01-78ET-33009)
(TES-33009-44) Avail: NTIS HC A07/MF A01

A summary of the major accomplishments for the development, fabrication, and testing of axially-grooved copper/water heat pipes for selenide isotopic generator (SIG) applications is presented. The early development consisted of chemical, physical, and analytical studies to define an axially-grooved tube geometry that could be successfully fabricated to provide the desired long term (up to seven years) performance. Heat pipe fabrication procedures, measured performance and accelerated life testing of heat pipes S/Ns AL-5 and LT-57 are discussed. DOE

N80-23830# Systems Consultants, Inc., Washington, D. C.
REGIONAL APPLICATION OF FOSSIL ENERGY TECHNOLOGIES: AN ANALYTICAL APPROACH Final Report
W. Rebello, D. Canete, H. Phipps, and R. Smith Sep. 1979 312 p refs
(Contract EX-76-C-01-2442)
(DOE/ET-2442-1) Avail: NTIS HC A14/MF A01

Energy supply/demand profiles are presented for the 50 states and the nine US census regions using 1974 statistics. These profiles include quality and type of energy reserves, annual primary resource production, and consumption by end-use sector. A method for use by energy planners in assessing the effects of policy decision on energy profiles was developed. A series of energy indices was derived for each census region. The indices are defined to include the effect of consumption of relatively scarce fuels (oil and gas) versus plentiful fuels (coal). A number of fossil energy technologies under development are described. The potential impact of the maturation of these technologies on each census region's energy posture is discussed in conjunction with any regional constraints that may exist. Finally, a number of sample what if scenarios are discussed and the impact of fossil fuel replacements on national, regional, and sector energy consumption quantitatively is assessed. DOE

MILLVILLE WIND TURBINE GENERATOR: FAILURE ANALYSIS AND CORRECTIVE DESIGN MODIFICATION
C. A. Waldon, M. J. Carr, and V. K. Grotzky Jul. 1979 25 p refs
(Contract EY-76-C-04-3533)
(RFP-2992/3533/79-3) Avail: NTIS HC A02/MF A01

Fatigue cracks in the blade skins of the Millville Wind Turbine Generator were fractographically analyzed. It is beleived they were caused by large flapwise deflections during a wind storm on December 4, 1978. The deflections caused the skin to buckle, which initiated rapidly growing fatigue cracks. Propagation continued to the leading edge, moving radially inward and outward along the leading edge radius. A modified blade design which incorporates several corrective techniques was then developed. DOE

OAK RIDGE FLYWHEEL EVALUATION LABORATORY Annual Report, 1 Apr. - 30 Sep. 1979
R. S. Steele, Jr., J. M. Casstevens, and B. J. Sutton Dec. 1979 29 p refs
(Contracts W-7405-eng-48; W-7405-eng-26)
(Y-2210) Avail: NTIS HC A03/MF A01

The Oak Ridge Flywheel Evaluation Laboratory (ORFEL) was assembled, and the initial stages of proof testing were completed. The significant accomplishments for the past year included the establishment of adequate full-time personnel; facility modification to reflect the emphasis on flywheel evaluation over simple testing; and the facility proof test involving two aluminum disk flywheels and one composite flywheel. DOE

N80-23833# IBM Federal Systems Div., Huntsville, Ala.
ENVIRONMENTAL DATA FOR SITES IN THE NATIONAL SOLAR DATA NETWORK
May 1979 266 p
(Contract EG-77-C-01-4049)
(Solar/0010-79/05) Avail: NTIS HC A12/MF A01

A major goal of the National Solar Heating and Cooling Demonstration Program is to collect and analyze data which will be used to determine the thermal performance of selected solar energy systems. To meet the goals and objectives of the Demonstration Program, the National Solar Data Network was developed. The network consists of sensors which measure key performance parameters at a selected site, a site data acquistion system, telephone transmission circuits and a central data processing system which collects data and performs the computations required for system performance analysis. The output of the National Solar Data Network is a monthly performance report which defines the energy contribution of the solar energy system and resultant fossil fuel savings. The performance data for homes throughout the US is included. DOE

PHOTOVOLTAIC MECHANISMS IN POLYCRYSTALLINE THINS-FILM SOLAR CELLS Quarterly Progress Report, 27 Sep. - 27 Dec. 1978
K. Zanio. Jun. 1979. 26 p. refs
(Contract ET-78-C-01-3412)
(DSE/3412-T1; QPR-1) Avail: NTIS HC A03/MF A01

Preliminary studies were initiated to examine and alleviate the deleterious effect of grain boundaries in solar cells fabricated from InP. The planar reactive deposition system was modified so that the InP substrate temperature could be reduced below the single crystalline to polycrystalline transition temperature and effects of grain boundaries on p-n junctions can be more readily and reproducibly separated out. A model for grain boundaries intersecting a p-n junction was introduced. In the model, the grain boundary is treated as a two dimensional array of lower bandgap material which enhances the leakage current at the p-n junction. The effect of various etchants on grain boundaries in InP was also examined as a preliminary step toward passivating the grain boundaries. An anodic oxide and InGaP, both candidates as passivation layers, were deposited on single-crystal InP. DOE

N80-23835# Fluidyne Engineering Corp., Minneapolis, Minn.
MHD AIR HEATER DEVELOPMENT TECHNOLOGY Progress Report, Oct. - Dec. 1978
Apr. 1979. 25 p. refs
(Contract ET-78-C-01-3005)
(CONS-3005-T2) Avail: NTIS HC A02/MF A01

Work on different tasks of the magnetohydrodynamic air heater development technology is described. The influence of heater system layout, duct dimensions, and heater sequencing on flow distribution was studied. One result was that localizing the bulk of the pressure drop in the heaters tends to minimize heater-toheater flow differences. An analysis of current flow back up the air duct from the combustor was done. Results showed that the voltage gradient and power loss back up the air duct depend on the ratio of electrical conductivities of air and duct wall insulation. Heat 201 was run with a Corhart X-317 matrix in the rig. Matrix test 7 (Heat 201) ran for over four hundred hours but was terminated early because of a restriction in the bed. This was caused by failure of the insulating lining in the hot gas duct between the burner and the matrix. DOE

N80-23836# CCB/CUMALI Associates, Oakland, Calif.
PASSIVE SOLAR CALCULATION METHODS Interim Report
15 Apr. 1979. 70 p. refs
(Contract EM-78-C-01-5221)
(DSE/5221-T1) Avail: NTIS HC A04/MF A01

The results accomplished under the following tasks: (1) evaluation of existing passive solar calculation methods, (2) BLAST/DOE-1 program interface and comparison with BR-202, and (3) development of analytic relationships between the thermal balance and weighting factor techniques are detailed. The various methods available for use in thermal load analysis are presented with detailed information on algorithm used in the thermal balance and weighting factor techniques. DOE

DESIGN OF LOW-COST STRUCTURES FOR PHOTOVOLTAIC ARRAYS. VOLUME 2: TECHNICAL STUDIES AND APPENDICES Final Report
Nov. 1979. 238 p. refs
(Contract EY-76-C-04-0789)
(SAND-79-7002-Vol-2) Avail: NTIS HC A11/MF A01

A study of low cost support structures for flat photovoltaic panels set at a fixed angle to the ground was conducted. The work began with a survey of solar system manufacturers. The results showed a diverse approach to the design of support structures and a lack of systematic design criteria. Therefore, a series of conceptual designs of support structures and their foundations were developed based on the use of concrete, steel or aluminum, and timber. A 6 MWe peak baseline photovoltaic power plant was conceptualized in order to bring a practical perspective to cost estimating for the designs. Detailed civil-structural design criteria were developed. These criteria identified loadings for normal operating conditions and extreme environmental conditions. The study results include detailed designs for eight array support structures and foundations for flat plate arrays using 8 foot wide panels with foundations spaced 20 feet apart along the rows in the east-west direction. Cost estimates for supports and foundations were shown to vary between $2 to $3 per square foot of supported panels (deflated to 1975 dollars). DOE

MAGNETIC FUSION ENERGY AND COMPUTERS: THE ROLE OF COMPUTING IN MAGNETIC FUSION ENERGY RESEARCH AND DEVELOPMENT
Washington, D.C. DOE. Oct. 1979. 57 p.
(DOE/ER-0033) Avail: NTIS HC A04/MF A01

The role of computing in the magnetic confinement fusion program is examined. The present status of the magnetic fusion energy computer center and its associated network is described. The role of computer models in the main elements of the fusion program is also examined and their dependence on the most advanced scientific computer is discussed. A study of computer requirements for the magnetic fusion energy program was conducted and the results of this analysis are presented. DOE

N80-23839# Oak Ridge National Lab., Tenn. Chemistry Div.
MOLTEN CARBONATE FUEL CELL PROGRAM. COMPOSITION GRADIENTS INDUCED BY CURRENT FLOW IN Li_2CO_3-K_2CO_3 MIXTURES Progress Report, 1 Jul. - 31 Dec. 1978
J. Braunstein, H. R. Bronstein, S. Cantor, D. E. Heatherly, J. I. Padova, T. M. Thomas, and C. E. Vallet. Dec. 1979. 15 p. refs
(Contract W-7405-eng-26)
(ORNL/TM-7061) Avail: NTIS HC A02/MF A01

Gradients in the Li/K ratio of a $LiKCO_3$ electrolyte caused by current flow in a molten carbonate fuel cell is the cation mobilities are unequal were examined. Composition gradients were predicted from estimated values of mobility, activity, and diffusivity utilizing a one dimensional model. Predictions from a similar model for a system of known properties were confirmed experimentally by electrolysis-relaxation experiments. The model calculations for carbonates are consistent with electrolysis-relaxation measurements on fuel cell tiles, but clearly indicate the need for additional specific physical property data, especially the tranference number. DOE

N80-23840# Puerto Rico Univ., Rio Piedras. Agricultural Experiment Station.
PRODUCTION OF SUGARCANE AND TROPICAL GRASSES AS A RENEWABLE ENERGY SOURCE Quarterly Report, 1 Dec. 1978 - 28 Feb. 1979
Alex G. Alexander, W. Allison, and M. Garcia. 1979. 45 p. refs
(Contract ET-78-S-05-5912; AES-UPR Proj. C-481)
(ORO-5912-T1; QR-3) Avail: NTIS HC A03/MF A01

Research on candidate screening, water and nitrogen regimes, and ratoon-crop performance for row-spacing, harvest frequency, and varietal variables is discussed. Greenhouse tests revealed several grasses having growth and drouth-tolerance characteristics superior to Sordan 70A, the project's outstanding short-rotation candidate up to this time. Johnson grass (Sorghum halepense), regarded as a weed by farmers, gave very favorable growth performances under simulated arid and semi-arid conditions. At six months into year 2, first ratoon data for sugarcane and

napier grass indicate yield increases of 33% and 4%, respectively, over plant crop yields. The NCo 310 is emerging as the outstanding sugarcane variety tested to date. There are no consistent responses to narrow row spacing. Frequent recutting (at 2 month intervals) is gradually destroying sugarcane but is not appreciably affecting napier grass. DOE

FEDERAL REPUBLIC OF GERMANY: ESTIMATES OF FUTURE ENERGY/GDP RELATIONSHIPS
R. Bruce Williamson and Edward L. Allen Dec. 1979 64 p refs
(Contracts EY-76-C-05-0033; DE-AC05-76OR-00033)
(ORAU/IEA(M)-79-22) Avail: NTIS HC A04/MF A01

Postwar trends in the West German economy, demography, and energy use were analyzed. The base year is 1976, and projections are made up to the yesr 2000 for gross domestic product (GDP) and sectoral energy demand. West Germany's 2.8 percent average annual GDP growth rate for the 1970s contrasts sharply with the 5.4 percent rate achieved in the 1960s. Future GDP growth is projected to level off at 2.9 percent a year, on the average, between now and 2000. This projection places German economic growth below that of Japan, Canada, and France but ahead of that projected for Italy and the United Kingdom. The relationship between West Germany energy demand and economic growth was stable in the postwar period. In 1976, total energy consumption stood at 9.8 quads and is projected to increase to 12.7 quads in 2000, an average annual 1.1 percent increase. The E/GDP ratio is expected to improve substantially by the year 2000, with the residential sector leading the way in energy efficiency. DOE

CONCEPTUAL DESIGN OF THERMAL ENERGY STORAGE SYSTEMS FOR NEAR-TERM ELECTRIC UTILITY APPLICATIONS Final Report
E. W. Hall, W. Hausz, R. Anand, N. LaMarche, J. Oplinger, and M. Katzer Nov. 1979 524 p refs Sponsored by NASA and EPRI
(Contract EC-77-A-31-1034; EPRI Proj. 1082-1)
(NASA-CR-159577; EPRI-EM-1218) Avail: NTIS HC A22/MF A01 CSCL 10A

Over forty concepts were examined for storage media, forms of containment, and cycle configurations for conversion to electricity. An extensive analysis and screening process resulted in selecting two coal-fired and two nuclear plants for detail conceptual design. The coal plants utilized peaking turbines and the nuclear plants varied the feedwater extraction to change power output. It was shown that the performance and costs of even the best of these systems could not compete in near-term utility applications with cycling coal plants and typical gas turbines available for peaking power. Lower electricity costs, greater flexibility of operation, and other benefits can be provided by cycling coal plants for greater than 1500 hours of peaking or by gas turbines for less than 1500 hours if oil is available and its cost does not increase significantly. LAMINATED COMPOSITE DISC FLYWHEEL DEVELOPMENT Interim Report, Jan. - 30 Jun. 1979
R. P. Nimmer, K. A. Toroosian, and J. S. Hickey Jul. 1979 75 p refs
(Contract W-7405-eng-48)
(UCRL-15154; IR-2) Avail: NTIS HC A04/MF A01

A flywheel with high energy density potential is considered. The actual testing of fabricated composite discs is reported with emphasis on spin tests to destruction on laminated S2-glass discs of various stacking sequences. The tests were designed to investigate the effect of alpha-number upon flywheel energy density. Progress in testing and interpreting results of these initial laminated disc flywheels is reported. OPEN-CYCLE COAL-FIRED LIQUID-METAL MHD
E. S. Pierson, M. Petrick, F. Schreiner, and D. Cohen 1979 12 p refs Presented at the 18th Symp. on Eng. Aspects of Magnetohydrodyn., Butte, Mont., 18-20 Jun. 1979
(Contract W-31-109-eng-38)
(CONF-790640-7) Avail: NTIS HC A02/MF A01

An open-cycle, coal fired, liquid magnetohydrodynamics (MHD) concept is described and compared with the open-cycle plasma MHD cycle, and it is shown that, in the former, temperatures are much lower and the air preheater and radiant boiler are eliminated. The constraints on the electrodynamic working fluid and the choice of copper are discussed. Recent experiments with liquid copper and coal combustion gas are described, and the indicated implications for environmental impact, i.e., SO/sub x/ and NO/sub x/ control, are discussed. Initial efficiency calculations yield values comparable to those for open-cycle plasma MHD at combustor temperatures as much as 1000 K lower and MHD generator temperatures more than 1000 K lower than is the case for open-cycle plasma MHD. Significantly, the liquid metal MHD system uses components that, except for the generator, are close to or within present-day technology, and it appears that readily available containment materials are compatible with the fluids. VERTICAL AXIS WIND TURBINE DEVELOPMENT Final Report, 1 Mar. 1976 - 30 Jun. 1977
R. E. Walters, J. B. Fanucci, P. W. Hill, and P. G. Migliore Jul. 1979 243 p refs
(Contract EY-76-C-05-5135)
(ORO-5135-77-5) Avail: NTIS HC A11/MF A01

Theoretical and experimental research accomplished in evaluating an innovative concept for vertical axis wind turbines (VAWT) is described. The concept is that of using straight blades composed of circulation controlled airfoil sections. The theoretical analysis was developed to determine the unsteady lift and moment characteristics of multiple-blade cross-flow wind turbines. To determine the drag data needed as input to the theoretical analysis, an outdoor test model VAWT was constructed; design details, instrumentation, calibration results, and initial test results are reported. Initial testing was with fixed pitch blades having cross-sections of conventional symmetrical airfoils. Costs of building the test model are included, as well as cost estimates for blades constructed with composite materials. These costs are compared with those of other types of wind turbines. DOE

DIRECT REGIONAL ENERGY/ECONOMIC MODELING (DREEM) DESIGN Final Report
P. D. Hall and C. J. Pleatsikas Oct. 1979 146 p refs
(Contract EI-78-C-01-6345)
(DOE/EIA/6345-1) Avail: NTIS HC A07/MF A01

The use of regional and multiregional economic models for estimating the indirect and induced impacts of Federally-mandated energy policies was investigated. Alternative types of energy policies that can impact regional economics and the available analytical frameworks for measuring the magnitudes and spatial extents of these impacts were examined. The models capabilities for addressing various energy policy issues are summarized. Then the applicability of the model in specified contexts is demonstrated by developing appropriate input data for three scenarios. These scenarios concern the multi-state impacts of

alternative coal mining development decisions, multi-regional impacts of macroeconomic change, and the comprehensive effects of an alternative national energy supply trajectory. DOE

UNITED KINGDOM: ESTIMATES OF FUTURE ENERGY/GDP RELATIONSHIP
J. C. Gehman and Edward L. Allen. Dec. 1979. 106 p. refs.
(Contracts EY-76-C-05-0033; DE-AC05-76OR-00033)
(ORAU/IEA(M)-79-25) Avail: NTIS. HC A06/MF A01

The UK economy is expected to grow in real terms due, for the most part, to advances in productivity. With productivity increasing, but at a declining rate, real GDP is projected at 50 percent above the 1976 level. The historical shift from goods production to services is expected to continue, but at a slower pace; by the year 2000 service output is expected to reach 55 percent of GDP. In the transport sector, the historical shift toward the passenger car is expected to saturate at about 70 percent of total ton-miles, while the shift toward truck freight is expected to continue and reach 76 percent of total ton-miles. Goods production is expected to stagnate and could fall to 33 percent of GDP by 2000. Historically, E/GDP has fallen steadily in the United Kingdom due almost exclusively to industrial conservation (investment in new and more efficient plant and equipment). Conservation should spread to all other sectors of the economy as a result of government policy. The E/GDP ratio is expected to fall by another 28 percent by the year 2000. This implies total energy consumption of 8.7 quads. DOE

N80-23849# Oak Ridge Associated Universities, Tenn. Inst. for Energy Analysis.
CANADA: ESTIMATES OF FUTURE ENERGY/GNP RELATIONSHIPS
E. L. Allen, James A. Edmonds, and R. Bruce Williamson. Dec. 1979. 61 p. refs.
(Contracts EY-76-C-05-0033; DE-AC05-76OR-00033)
(ORAU/IEA(M)-79-24) Avail: NTIS. HC A04/MF A01

The Canadian economy expanded at an annual rate of 4.6 percent in the 1970s (GNP growth), second only to the remarkable record of Japan. In the future, Canadian economic development is expected to fall below past rates of achievement, primarily because of declining numbers of new entrants in the labor force. However, other factors affecting growth remain favorable. Canada, in particular, is virtually self-sufficient in energy. Government policy is to carry out a vigorous program of conservation, and to parallel this effort with domestic energy price increases which will move up to world levels over the next few years. As to economic growth, GNP expansion is expected to remain well above 3 percent a year for the balance of this century. Energy consumption is expected to grow from 7.51 Btu x 10 to the 15th power (quads) in 1976 to 13.3 quads by 2000. This means that energy growth, as a consequence of determined conservation, is expected to be about half as rapid as economic growth to 1990. DOE

RESEARCH AND DEVELOPMENT OF AN AIR-CYCLE HEAT-PUMP WATER HEATER. Final Report
John T. Dieckmann, Alve J. Erickson, Andrew C. Harvey, and William M. Toscano. 1 Oct. 1979. 343 p. refs.
(Contract W-7405-eng-26)
(ORNL/SUB-7226/1) Avail: NTIS. HC A15/MF A01

A prototype reverse Brayton air cycle heat pump water heater was designed and built for residential applications. The system consists of a compressor/expander, an air-water heat exchanger, an electric motor, a water circulation pump, a thermostat, and fluid management controls. A potential residential market for the new high-efficiency water heater of approximately 480,000 units/y was identified. The retail and installation cost of this water heater is estimated to be between $500 and $600 which is approximately $300 more than a conventional electric water heater. As part of the design effort, a thermodynamic parametric analysis was performed on the water heater system. It was determined that to obtain a coefficient of performance of 1.7, the isentropic efficiency of both the compressor and the expander must be at least 85 percent. The selected mechanical configuration is described. DOE

INVESTIGATION OF THE TECHNICAL AND ECONOMIC FEASIBILITY OF USING PUMPED WELL-WATER ENERGY STORAGE SYSTEMS. Final Report
Dec. 1979. 92 p. refs.
(Contract EY-76-C-04-0789)
(SAND-79-7096; BDM/TAC-79-518-TR-R1) Avail: NTIS. HC A05/MF A01

Work completed on the three technical tasks of the project is summarized. The first task included a conceptual/preliminary system design, a selection of potential geographic locations in New Mexico for this system, and a study of relating institutional issues. The second task included a design of the baseline energy storage system with the identification of major components (off the shelf) and their associated performance estimates and a proposed site location within New Mexico. The third task area included an estimate of the capital cost for the storage system (e.g., cost of major components and processes, O and M costs) and an estimate of the potential annual fossil fuel savings. PERFORMANCE IMPROVEMENT OF A SOLAR HEATING SYSTEM UTILIZING OFF-PEAK ELECTRIC AUXILIARY. Semiannual Progress Report, 18 Jun. - 31 Dec. 1979
A. H. Eltimsahy. Dec. 1979. 10 p.
(Contract DE-FG02-79R5-10140)
(DOE/R5/10140-1) Avail: NTIS. HC A02/MF A01

A solar-assisted heat pump system, which was designed, installed, and operated in an experimental solar house, is described. The heat pump system is capable of operating in a wide range of temperatures which is needed in a solar house utilizing off-peak storage from the electric utility. The complete system consists of 584.1 square feet of flat plate solar collectors, a 5 horsepower compressor, an evaporator, a condenser, thermal storage units, and associated equipment. During the installation and initial operation of the system, numerous aspects of the feasibility of the system design were evaluated. Many of these aspects point to the potentially improved operating performance of a solar heating system utilizing off-peak storage from the electric utility. DOE

(BNL-27012; CONF-791204-13) Avail: NTIS
HC A02/MF A01

An overview is given of the series solar heat pump concepts and the reasons why it can serve an important role in energy conservation in space heating. These are highlighted by elevated coefficients of performance (COP's) and the use of low temperature potentially inexpensive solar collectors. The characteristics required of the subsystems and integrated system are detailed. Particular emphasis is given to the performance of the heat pump itself at high temperature source conditions corresponding to those of solar input, and recent laboratory results which demonstrate very high COP's using practical components are shown. The reasons why the high COP's are a necessary but not sufficient condition for competitive overall system performance are detailed and methods for applying the high COP's to an effective solar assisted heat pump system are discussed. Ongoing development work in the field is summarized. DOE

(Contracts ET-78-C-04-5395; DE-AC04-78ET-23055)
(DOE/ET/23055-1) Avail: NTIS HC A08/MF A01

A 100kW peak flat panel photovoltaic power system to supply power to a machine shop load in Columbus, Ohio was designed. The system will provide three-phase, 240 volt ac power to a machining and metal-working facility which has 100 pieces of machinery and employs 50 machinists and other craftsmen. The system will operate in parallel with the utility which will supply the backup power. Due to the close match of the array power output to the workday shop load, only a small amount of the power generated is excess to the concurrent shop demand. When there is any excess, it will be fed to alternate loads at the site, rather than into the utility grid. A system performance analysis indicates that the system will supply approximately 115,000 kWh/ year of electrical energy after all losses. The system uses high energy-density flat panel photovoltaic modules in a roof-mounted installation, and employs a microprocessor controlled power conditioning unit. DOE

PROBABILITY MODELING AND ESTIMATION FOR HOURLY VARIATION OF AIR POLLUTION CONCENTRATIONS Ph.D. Thesis
Chen-Hui Lisa Foo 1980 57 p
Avail: Univ. Microfilms Order No. 8011635

A probability model is presented which describes the behavior of high pollutant concentrations. The model characterizes the variation of hourly average concentration, after a suitable normalization, as the superposition of a daily random effect and an hourly random effect. Without the daily random effect this model becomes one for repeated measurements on the

autoregressive process of order one. Without the hourly random effect, it becomes a variance components problem. The maximum likelihood estimates of the model parameters are derived. A particular set of mid-day oxidant data were chosen from San Jose Piedmont monitoring station. The maximum likelihood estimates are obtained for the data in which the estimated daily random effect is very small. The estimation of the probabilities of threshold exceedances of mid-day oxidant concentrations is also studied. Sensitivity analysis was done on the estimation of the above probabilities by varying the model parameters.

DEVELOPMENT OF A REGIONAL TRANSPORT/TRANSFORMATION/REMOVAL MODEL FOR SO2 AND SULFATE IN THE EASTERN UNITED STATES Ph.D. Thesis
Gregory Richard Carmichael 1979 358 p
Avail: Univ. Microfilms Order No. 8010494

A combined transport-chemistry model that describes the regional distribution of SO2 and sulfate within the lower troposphere is developed. The mathematical analysis is based on the coupled three dimensional advection-diffusion equations for SO2 and sulfate and incorporates chemical transformations as well as the physical phenomena of dry deposition at the surface and wet deposition. The analysis also considers spatial variations in topography and spatial and temporal variations in both the mixing layer heights and the wind field. The dynamic model employs a Galerkin method for the numerical solution of the partial differential equations. Results from a series of numerical experiments show the Galerkin method to be superior, in terms of accuracy and computation time, to the finite difference methods tested. Numerical results studying the interactions of convection, diffusion, chemical reaction, pollutant removal, and the effects of contaminant emission source strength, source location and multiple sources are also presented.

SEASONAL AND GEOGRAPHICAL DISTRIBUTION OF PRIMARY AMINES IN HOUSTON ATMOSPHERE Ph.D. Thesis
Chi-Ping Jack Peng 1979 129 p
Avail: Univ. Microfilms Order No. 8010902

The seasonal and geographical distribution pattern of airborne primary amines in the Houston atmosphere is examined. Free primary amines, amine salts, and pollens in the air were collected on glass fiber filters by means of a high volume sampler. Acid digestion dissolved the free amines, their salts, and pollens from the filter paper into solution. Fluorescamine was used as the fluorescent reagent. Fluorophor was quantified with a spectrophotofluorometer with high specificity and sensitivity. A total of 15 sets of samples were collected. Each set of samples consisted of 25 to 29 specimens which were collected at 29 different stations around the Houston area. Multiple regression analysis was applied to assess the role of different meteorological factors on the variation of amines. The SYMAP technique was used to show amine variations across the city and thus suggested possible sources for amines.

THE CHEMICAL TRANSFORMATION OF SULFUR DIOXIDE TO SULFATE IN THE PLUME OF THE COAL-BURNING KEYSTONE POWER PLANT Ph.D. Thesis
Allen Conrad Dittenhoefer 1979 137 p
Avail: Univ. Microfilms Order No. 8010048

Measurements of the oxidation rate of sulfur dioxide to sulfate particles were made in the plume of the coal-fired Keystone power plant using instrumented aircraft. Aerosol number concentrations in nine distinct size intervals spanning the range 0.01-2.0 micrometer diameter were obtained using a condensation nucleus counter, an optical particle counter, and an electrical aerosol analyzer. These measurements were combined with cascade impactor sampling and quantitative sulfate analysis of individual plume and background particles using a transmission electron microscope to determine the mass concentration of sulfate at various positions in and out of the plume. From cross sectional plume mappings of the horizontal and vertical concentration profiles of SO2 and sulfate mass it was possible to calculate the SO2 conversion rate in the plume. It was found that although plume sulfate particle size distributions were highly dependent on both ambient relative humidity and solar radiative flux, relative humidity was the predominant parameter governing the SO2 transformation rate within the initial one to two hours of plume transport.

EVALUATING AND MINIMIZING NOISE IMPACT DUE TO AIRCRAFT FLYOVER Final Report
Ira D. Jacobson May 1980 78 p refs
(Grant NsG-1509)
(NASA-CR-153187; UVA/528166/MAE80/102) Avail: NTIS HC A05/MF A01

The results of a study on the evaluation and reduction of noise impact to a community due to aircraft landing and takeoff operations are presented. The case of multiple aircrafts flying on several trajectories, for either approach/landings or takeoffs was examined. An extremely realistic model of the flight path was developed. The annoyance criterion used was the noise impact index (NII). The algorithm was applied to Patrick Henry International Airport.

ASSESSMENT OF POTENTIAL EXPOSURE TO FRIABLE INSULATION MATERIALS CONTAINING ASBESTOS
Walter S. Kim and David E. Kuivinen Apr. 1980 41 p refs
(NASA-TM-81435; E-359) Avail: NTIS HC A03/MF A01 CSCL 13B

Asbestos and the procedures for assessing potential exposure hazards are discussed. Assessment includes testing a bulk sample of the suspected material for the presence of asbestos, and monitoring the air, if necessary. Based on field inspections and laboratory analyses, the health hazard is evaluated, and abatement measures are taken if a potential hazard exists. Throughout the assessment and abatement program, all applicable regulations are administered as specified by the Environmental Protection Agency and the Occupational Safety and Health Administration.

ENVIRONMENTAL DEVELOPMENT PLAN: GEOTHERMAL ENERGY SYSTEMS
Aug. 1979 77 p refs
(DOE/EDP-0036) Avail: NTIS HC A05/MF A01

All current and planned activities of the DOE Geothermal Energy Systems Program are covered. Major elements of this program include exploration of resources, confirmation of reservoirs, development of energy extraction systems, demonstration of utilization systems, identification and removal of institutional barriers, and a loan guaranty program. Environmental concerns and requirements for resolution of these concerns are discussed in detail. In terms of immediate need and importance in getting power online, the emission of H2S is the most important concern and the demonstration of an effective abatement system is the most significant requirement. Other significant concerns are the management or disposal of spent geothermal fluids, the potential of land subsidence, questions of water availability for heat rejection systems, land use conflicts, and socio-economic and cultural problems. The requirements to appropriately research and mitigate these and other concerns in time to permit orderly and timely development of geothermal energy systems are presented.

POTENTIAL AIR QUALITY IMPACT OF GEOTHERMAL POWER PRODUCTION IN THE IMPERIAL VALLEY
P. H. Gudiksen, D. L. Ermak, K. C. Lamson, M. C. Axelrod, and R. A. Nyholm Oct. 1979 42 p refs
(Contract W-7405-eng-48)
(UCRL-52797) Avail: NTIS HC A03/MF A01

A regional assessment of the potential impact on air quality of developing the Imperial Valley's geothermal resources for power production is presented. A network of six stations was installed to characterize the air quality and atmospheric transport properties for the valley before development. These measured the ambient air concentrations of H2S, SO2, O3, NO, NO/x, CO2, Hg, Rn, and particulates. The geothermal fluids were analyzed chemically to estimate potential emission rates from future power plants. Using these data and advanced air quality modeling led to the prediction of the potential valley-wide impact of a 3000 MW development scenario. The impact analysis reveals that H2S is the principal gaseous pollutant of concern. The ambient H2S concentrations that would result from generating 3000 MW without emission controls exceed the California air quality standard (30 ppb) at least 1% of the time for an area in the northern part of the valley that is roughly 1500 sq km in size. EVALUATION OF EMPIRICAL ATMOSPHERIC DIFFUSION DATA
T. W. Horst, J. C. Doran, and P. W. Nickole Oct. 1979 151 p refs
(Contract EY-76-C-06-1830)
(NUREG-CR-0789; PNL-2599) Avail: NTIS HC A08/MF A01

A study was made of atmospheric diffusion over level, homogeneous terrain of contaminants released from non-buoyant point sources up to 100 m in height. Current theories of diffusion are compared to empirical diffusion data, and specific dispersion estimation techniques are recommended which can be implemented with the on-site meteorological instrumentation required by the Nuclear Regulatory Commission (NRC). A comparison of both the recommended diffusion model and the NRC diffusion model with the empirical data demonstrates that the predictions of the recommended model have both smaller scatter and less bias, particularly for groundlevel sources. MATHEMATICAL MODELS FOR ATMOSPHERIC POLLUTANTS. APPENDIX C: GOVERNING EQUATIONS FOR ATMOSPHERIC TRACE CONSTITUENTS AND SOLUTION TECHNIQUES Final Report
R. L. Drake Aug. 1979 252 p refs Sponsored in part by Electric Power Research Inst.
(Contract EY-76-C-06-1830)
(EPRI-EA-1131-App-C) Avail: NTIS HC A08/MF A01

The governing equations for the evolution and fate of airborne gases and particles are described, and exact and approximate solution techniques are presented. Among the systems of equations are: the conservation of mass, momentum and energy and the equations of state for defining the motion, pressure, density and temperature fields of the atmosphere; the conservation of liquid water and water vapor; the radiation equations for the solar and terrestrial radiation intensities; the conservation equations for non-reactive and reactive gases and aerosols. The techniques for obtaining exact solutions of diffusion and aerosol equations are: series methods, integral transforms, similarity techniques, principle of superposition and Green's functions. Among the approximate solution techniques described in this document are: the classical techniques, such as successive approximations, asymptotic techniques, perturbation methods, the method of moments and integral methods, random walk and Monte Carlo techniques; finite difference methods and spectral and variational methods, including finite element techniques. AEROSOL, TRACE ELEMENTS AND VISIBILITY MEASUREMENTS IN MOUNTAINOUS TERRAIN
M. M. Orgill, N. S. Laulainen, D. R. Drawes, and R. N. Lee Jan. 1979 10 p refs Presented at the 19th Ann. Meeting of the Inst. of Environ. Sci., Seattle, 30 Apr. - 2 May 1979 Submitted for publication
(Contract EY-76-C-06-1830)
(PNL-SA-7576; CONF-790445-7) Avail: NTIS HC A02/MF A01

Data on the relationships between aerosols, trace elements, and visibility in mountainous terrain and air pollutants from existing industrial, urban, agricultural and transportation sources in the Pacific Northwest states of Washington, Oregon, and Idaho were analyzed. Data were obtained by airborne instruments. Twelve sampling flights provided data on scattering extinction coefficient, trace elements, sulfate, and ozone during relatively good prevailing visibility conditions. Over 80 percent of the sample flights indicated that the meteorological range was 20 km or more. Four or five of the sampling flights indicated the presence of visibility reducing haze. Relatively higher concentrations of certain crustal and anthropogenic trace elements and sulfate (associated with high relative humidities) resulted in degradation of meteorological range in the foothills of Cascades, Snoqualmie Pass and Kittitas Valley and Columbia River Gorge. ROLE OF TEMPERATE ZONE FORESTS IN THE WORLD CARBON CYCLE: PROBLEM DEFINITION AND RESEARCH NEEDS
Thomas V. Armentano, ed. and J. Hett, ed. Jul. 1979 69 p refs Workshop held in Indianapolis, 21-22 Mar. 1979
(Contract DE-AC02-79EV-10040)
(DOE/ET/10040-1) Avail: NTIS HC A04/MF A01

Carbon uptake and losses from temperate zone forests are reported. The forest inventory data reviewed suggest the temperate zone forests could have functioned for the past several decades as a net sink for 10 to the 9th power tons of carbon annually. However, due to the limited data on noncommercial timberlands, nonmerchantable tree components, and soil organic matter changes, the precision of this estimate of temperate zone C retention may be only within one-quarter to one-half of the true value. Despite this limitation, the data suggest strongly that temperate zone forests probably are not a source of carbon. The principal areas for which new information would reduce uncertainties in estimates of carbon uptake and losses from temperate zone forests are discussed, and recommendations are made for a series of research initiatives to increase resolution of the problem areas. MATHEMATICAL MODELS FOR ATMOSPHERIC POLLUTANTS. APPENDIX D: AVAILABLE AIR QUALITY MODELS Final Report
R. L. Drake, D. J. McNaughton, and C. Wang Aug. 1979 140 p refs Sponsored in part by DOE
(EPRI Proj. 805)
(EPRI-EA-1131-App-D) Avail: NTIS HC A07/MF A01

Models that are available for the analysis of airborne pollutants are summarized. In addition, recommendations are given concerning the use of particular models to aid in particular air quality decision making processes. The air quality models are characterized in terms of time and space scales, steady state or time dependent processes, reference frames, reaction mechanisms, treatment of turbulence and topography, and model uncertainty. Using these characteristics, the models are classified in the following manner: simple deterministic models, such as air pollution indices, simple area source models and rollback models;

statistical models; such as averaging time models, time series analysis and multivariate analysis; local plume and puff models; box and multibox models; finite difference or grid models; particle models; physical models, such as wind tunnels and liquid flumes; regional models; and global models. ENVIRONMENTAL STANDARDS FOR COAL CONVERSION PROCESSES. VOLUME 1: MOST STRINGENT, FEDERAL, AND SELECTED STATE REGULATIONS Final Report, Feb. 1977 - Jan. 1979
D. K. Webber and D. E. Whittaker Oct. 1979 268 p refs
(Contract EPA-68-02-2198)
(PB80-126980; EPA-600/7-79-231-A) Avail: NTIS HC A12/MF A01 CSCL 13B

Existing and proposed environmental standards are synopsized as a guide for evaluating the efficiency of available and developing technology for controlling liquid, gaseous, and solid wastes from coal conversion processes. Within the U.S., the Federal (including EPA) standards and guidelines for air, water, and solid wastes were gathered together with standards for 22 states selected

for their potential in installing coal conversion facilities) and two regional commissions. Because environmental effects can cross national borders, standards and guidelines for Mexico, the Dominion of Canada, two Canadian provinces, and the international Joint Commission of U.S. and Canada were synopsized and added to the U.S. standards. All standards and guidelines are compared; from them the most stringent standards are summarized. GRA

AIR QUALITY CRITERIA FOR OZONE AND OTHER PHOTOCHEMICAL OXIDANTS
Apr. 1978 372 p refs
(PB80-124753; EPA-600/8-78-004) Avail: NTIS HC A16/MF A01 CSCL 13B

Current knowledge regarding the origin of ozone and other photochemical oxidants is presented and assessed. Data on the effects of oxidant/ozone in the ambient air on man, vegetation, and ecosystems are summarized. The effects that have been observed will form the scientific basis for supporting the present National Ambient Air Quality Standard of 160 micrograms/cu m (0.08 ppm) or a revised standard. In this document, toxic organics are considered only with respect to eye irritation. The studies and data cited constitute the best available basis for specific standards aimed at protecting human health and the environment from photochemical oxidants in ambient air. GRA

ANALYSIS OF HIGH SULFATE CONCENTRATIONS IN GREATER NEW YORK CITY AIR Technical Report, Dec. 1978 - Aug. 1979
Gerard A. DeMarrais and Dale H. Coventry Dec. 1979 43 p refs
(PB80-128515; EPA-600/4-79-074) Avail: NTIS HC A03/MF A01 CSCL 04B

The meteorological phenomena which occurred during April 15 to 21, 1976, when high sulfate concentrations were measured in the New York City area, are summarized. Relationships between meteorological phenomena and high sulfate concentrations are compared to these findings. Since ozone readily occurs with the same meteorological conditions that are associated with sulfate episodes, the ozone concentrations are also discussed. Results show that the current procedure for sampling sulfate every sixth day does not provide sufficient data for determining how sulfate concentrations relate to meteorological phenomena. GRA

THE FREQUENCY DEPENDENCE OF Q Ph.D. Thesis
Gary Michael Lundquist 1979 281 p
Avail: Univ. Microfilms Order No. 8011290

That the fractional energy loss per cycle of an harmonic wave,Q(-1), is a function of the frequency, w, of the cycle is demonstrated and models of Q(-1) (w)-vs-depth which meet all available constraints are presented. Empirical observations on the value and depth dependence of the relaxation time (tau sub 2)are made in the frequency domain. The average position of tau sub 2 over teleseismic raypaths is found by fitting observed body-wave source spectra to a range of theoretical models. The results show that Q must be frequency dependent and that, on the average over the upper 1500 km in the mantle, tau sub 2 is approximately 0.07 to 0.16 sec, corresponding to about 1.0 to 2.4 Hz. First order models of tau sub 2-vs-depth are estimated from the ratio of Q(-1) defined by body-wave inversion to the Q(-1) defined by free oscillation inversion. The first order models are tested in the domain. Synthetic seismograms generated for an absorption band rheology are compared to observed seismograms of nuclear explosion sources in both Nevada and Novaya Zemlya. Dissert. Abstr.

INVESTIGATION OF TIDAL DISPLACEMENTS OF THE EARTH'S SURFACE BY LASER RANGING TO GEOS-3
D. R. Bower, J. Halpenny, M. K. Paul, and A. Lambert Apr. 1980 32 p refs
(NASA-CR-156863) Avail: NTIS HC A03/MF A01 CSCL 08F

An analysis of laser ranging data from three stations was carried out in an attempt to measure the geometric Earth tide. Two different approaches to the problem were investigated. The dynamic method computes pass to pass apparent movements in stations height relative to short arcs fitted to several passes of data from the same station by the program GEODYNE. The quasi-geometric method reduces the dependence on unmodelled satellite dynamics to a knowledge of only the radial position of the satellite by considering two station simultaneous ranging at the precise time that the satellite passes through the plane defined by two stations and the center of mass of the Earth. (NASA-CR-153192) Avail: NTIS HC A06/MF A01 CSCL 08G

Inclusions of clinopyroxenite, kaersutiteclinopyroxenite, kaersutite-rich inclusions, wehrlite and olivine-clinopyroxenite together with megacrysts of feldspar, kaersutite and spinel are found loose on the flanks of cinder cones, as inclusions within lava flows and within the cores of volcanic bombs in the Quaternary alkali-olivine basalt of the West Potrillo Mountains, southcentral New Mexico. Based on petrological and geochemical evidence the megacysts are interpreted to be phenocrysts which formed at great depth rather that xenocrysts of larger crystal aggregates. These large crystals are believed to have formed as stable phases at high temperature and pressure and have partially reacted with the basalt to produce subhedral to anhedral crystal boundaries. It can be demonstrated that the mafic and ultramafic crystal aggregates were derived from an alkali-basalt source rock generated in the mantle. The inclusions are believed to represent a cumulus body or bodies injected within the lower crust or upper mantle. A.R.H.

APPLICATION OF LASER RANGING AND VLBI DATA TO A STUDY OF PLATE TECTONIC DRIVING FORCES Final Technical Report, 1 Apr. 1978 - 31 Mar. 1979
Sean C. Solomon 30 May 1980 175 p refs
(Grants NsG-7329; NSF EAR-74-21894; NSF EAR-78-12936)
Avail: NTIS HC A08/MF A01 CSCL 08G

The measurability of changes in plate driving or resistive forces associated with plate boundary earthquakes by laser rangefinding or VLBI is considered with emphasis on those aspects of plate forces that can be characterized by such measurements. Topics covered include: (1) analytic solutions for two dimensional stress diffusion in a plate following earthquake faulting on a finite fault; (2) two dimensional finite-element solutions for the global state of stress at the Earth's surface for possible plate driving forces; and (3) finite-element solutions for three dimensional stress diffusion in a viscoelastic Earth following earthquake faulting. VOLCANIC FEATURES OF HAWAII. A BASIS FOR COMPARISON WITH MARS
M. H. Carr (U.S. Geological Survey, Menlo Park, Calif.) and R. Greeley Washington 1980 216 p refs Original contains color illustrations
(NASA-SP-403; LC-80-600024) Avail: NTIS MF A01; SOD HC $14.00 CSCL 08K

Despite the difference in size Martian and Hawaiian volcanoes have numerous characteristics in common. Specific features such as lava channels, collapsed lava tubes, levees and flow fronts, all very common in Hawaii, are also abundant on the flanks of some of the Martian volcanoes. Striking differences also exist, such as the apparent lack of radial rift zones on some Martian volcanoes and the paucity of cinder and spatter cones. Some of the best photographs of Martian and Hawaiian volcanic features are presented. Descriptive legends are provided for each picture. An overview of the geological processes and structures depicted is included. A.R.H.

CONDUCT OF CLOUD SPECTRA MEASUREMENTS Progress Report, 1 Dec. 1978 - 30 Sep. 1979
Gabor Vali, Marcia K. Politovich, Darrel G. Baumgardner, and William A. Cooper Oct. 1979 61 p refs
(Contract F19628-79-C-0029; AF Proj. 6670)
(AD-A081127; AFGL-TR-79-0251; SR-1) Avail: NTIS HC A04/MF A01

The work addressed the following objectives: Compare bench determinations of Axially Scattering Spectrometer Probe (ASSP) and Forward Scattering Spectrometer Probe (FSSP) sample areas with determinations during actual cloud sampling; evaluate the accuracy of the overlap in size range between FSSP and 1D-C probes; evaluate the response of the ASSP and FSSP probes to ice crystals; check the statistical correction schemes used to deal with 1D-C counts in the lowest and highest size categories. The information needed to accomplish these objectives was collected by performing special tests with the probes in question. These tests were conducted, for the most part, at the Elk Mountain Laboratory, during times when the Observatory was enveloped by clouds. Bench and wind-tunnel tests were utilized. In addition, data were derived from aircraft penetrations of clouds, with identical probes as those used at the observatory. GRA

KWAJALEIN REFERENCE ATMOSPHERES, 1979 Interim Scientific Report
Allen E. Cole, Arthur J. Kantor, and C. Russell Philbrick 9 Oct. 1979 109 p refs
(AF Proj. 6670; AF Proj. 6690)
(AD-A081780; AFGL-TR-79-0241; AFGL-ERP-677) Avail: NTIS HC A06/MF A01 CSCL 04/1

Measurements of atmospheric temperature, density, and wind have been used to derive consistent hydrostatic models representative of the atmospheric properties at Kwajalein Atoll, Marshall Islands. A mean annual model and 12 monthly models of thermodynamic properties have been constructed between altitudes of 0 and 120 km, using data available up to 1979. Below an altitude of 60 km, the models are based on a data base that is large enough for the monthly variations to be statistically significant. Above 60 km the significance of the monthly models progressively decreases with altitude because of the small number of high-altitude measurements. The statistical properties of winds have been calculated for altitudes up to 60 km for the midseason months. Although the information used to prepare these models is based primarily on observations made at Kwajalein, some data from other tropical locations have been considered, particularly for such items as the estimates of time and space variations. The Kwajalein Missile Range (KMR) Reference Atmospheres contains information on the following parameters: temperature, pressure, density, speed of sound, dynamic viscosity, wind speed and direction, relative humidity, optical and radar indices of refraction, mean molecular weight, interlevel correlations of temperature, density, and wind, acceleration of gravity, and magnitudes of diurnal and semidiurnal tidal components of temperature, density, and wind. APPLICATIONS OF A DEDICATED GRAVITATIONAL SATELLITE MISSION
1979 64 p refs Presented at the Workshop on a Dedicated Gravitational Satellite Mission, Washington, D.C., 28-30 Nov. 1978
(Contract N00014-76-C-0411)
(AD-A076438) Avail: NTIS HC A04/MF A01 CSCL 08/5

In the late 1960's, it became clear that satellite-determined gravity field data contained a large amount of geophysical and geodetic information. Today, it appears that satellite technology may be capable of resolving the short- and intermediate-wavelength components (100-1000 km) in the Earth's gravity field, thereby contributing even more significantly to the solution of geophysical and geodetic problems and opening up important oceanic applications. A previous NRC report recommended a dedicated gravitational satellite mission (low-altitude satellite or satellites to be launched specifically for the purpose of accurately determining the details of the Earth's gravity field) subject to the analysis of accuracy requirements and feasibilities. This report is the product of a Workshop held in Washington, D.C., from November 28 to November 30, 1978, under the auspices of the NRC's Committee on Geodesy and its Panel on Gravity Field and Sea Level, to ascertain the applications of a dedicated gravitational satellite mission. Topics include: Technology Assessment; Solid-Earth Geophysics--Continents and Oceans; Oceanic Circulation; and Ephemeris and Geodetic Applications. GRA

SEISMIC DATA CATALOG AND ASSOCIATED GRAPHICAL CAPABILITIES
T. N. Bishop, H. P. Foote, and S. C. Blair Nov. 1979 55 p refs
(Contract EY-76-C-06-1830)

(PNL-2893) Avail: NTIS HC A04/MF A01

An extensive data base of compiled seismic data is described along with useful and unique computer techniques for analysis and display of the data. Software associated with the data base include programs for editing earthquake files, sorting files with respect to time, location, or magnitude, selecting data by use of various parameters and merging files. The desired file may then be listed or displayed graphically. From the data analysis software, an accurate and comprehensive earthquake catalog for the Pacific Northwest was created. Graphic displays can plot two and three dimensional epicenter or hypocenter information. Magnitude and/or depth information can be represented on two-dimensional plots by using color of symbol size. Plots can be produced using a variety of map projections and at a specified scale. The capability allows the use of any desired map as a base map for the display of earthquake data. Dissert. Abstr.

COMPREHENSIVE STUDY OF THE SEISMOTECTONICS OF THE EASTERN ALEUTIAN ARC AND ASSOCIATED VOLCANIC SYSTEMS Annual Progress Report, 1 Mar. 1979 - 29 Feb. 1980

K. H. Jacob, J. N. Davies, and K. R. Sykes 1979 111 p refs

(Contract EY-76-S-02-3134)

(COO-3134-20) Avail: NTIS HC A06/MF A01

The modern and historic seismicity of the eastern Aleutian arc was thoroughly researched and shows clear evidence that the Shumagin Islands region of the arc has been ruptured at least partly by previous large or great earthquakes; has recurrence times for large earthquakes between 50 and 115 years; has precently the properites of a seismic gap, i.e., was pot ruptured by a large or great earthquake for a least 76 years; and shows a donut configuraton of modest seismicity including high-stress-drop events around the rim combined evidenc it is concluded that the likelihood for a large or great earthquake to occur within the Shumagin Island gap is high within the next three decades. Stress, stress-drop, and other source parameters of moderate earthquakes in the Shumagin islands gap were alturmined along with similar results for the St. Elaias earthquakes neat the Takatage gap in the eastern Gulf of Alaska. GRAVITY STUDY OF THE LOS ALAMOS AREA, NEW MEXICO

Laurel M. Williams Nov. 1979 21 p refs

(Contract W-7405-eng-36)

(LA-8154-MS) Avail: NTIS HC A02/MF A01

Profiles of gravity readings were observed along two CXC seismic reflection lines recently recorded in Los Alamos County, one in Los Alamos Canyon, the other in Mortandad Canyon and on Sigma Mesa. These data were merged with available gravity data in the Los Alamos area and a density profile across Los Alamos Canyon was modeled to find the proper reduction density. The resulting Bouguer map of the Pajarito Plateau suggests the basement deepens to the northeast. Two dimensional computer modeling of the gravity profiles indicates that subsurface lenses of Tschicoma Formation along the west edge of the Pajarito Plateau may act as an effective basement, obscuring actual basement structures in that area. Thus, an alternative to the graben interpretation of the prominent gravity low in the area is that this low is due to density contrasts within the thick sequences of Quaternary volcanics present. ATMOSPHERIC RAYLEIGH SCATTERING IN THE ULTRAVIOLET AND VISIBLE SPECTRAL REGION
Dieter Beran Nov. 1979 43 p refs Transl. into ENGLISH of "Atmosphaerische Rayleigh-Streung im Ultraviolc..en und Sichtbaren Spektralkber.", Rept. DLR-Mitt-78-03 DFVLR, Oberpfaffenhofen, West Germany, Oct. 1977 Original report in GERMAN previously announced as N79-30888 Original German report available from DFVLR, Cologne DM 17.90
(ESA-TT-588; DLR-Mitt-78-03) Avail: NTIS HC A03/MF A01

Attenuation by scattering and absorption of solar radiation entering the Earth's atmosphere was studied in order to determine the role of Rayleigh scattering. It is shown that Rayleigh scattering is a function of the solar flux and the scattering cross section. Generally, Rayleigh scattering is single scattering because the small cross section and with it, the low optical depth, do not permit multiple scattering. Rayleigh intensity however depends on direction and is polarized. For the anisotropic air molecules a depolariztion factor must be involved. The absorption of solar radiation in the wavelength region under consideration is discussed as being caused by ozone and by molecular oxygen.

DYNAMIC FRACTURE STRENGTH OF OIL SHALE AND COAL
W. E. Jahsman (Colorado Univ., Boulder) 1919 30 p refs Sponsored by Colorado Univ.
(OUEL-1295/79) Avail: NTIS HC A03/MF A01

Measurements were carried out on tubular specimens of oil shale and coal using the torsional Kolsky apparatus (split Hopkinson bar) to show that these materials exhibit strain rate dependent fracture strengths. At shear strain rates of 500 s, typical fracture strengths were found to be 80 MPa for oil shale and 12 MPa for coal. A stress redistribution occured in the specimen after initial fracturing along planes perpendicular to the maximum tensile stress. The fracture strength reported for coal, was accompanied by a compressive stress of equal magnitude. The final mode of failure in this case was compressive rather than tensile.

CHARACTERIZATION OF VISIBILITY-REDUCING AEROSOLS IN THE SOUTHWEST. PROJECT VISTA Final Report, 1-10 Oct. 1977
Edward S. Macias, Donald L. Blumenthal, Jerry A. Anderson, and Bruce K. Cantrell Nov. 1979 68 p refs
(Contract EPA-68-02-2713)
(PB80-139041; MRI-78-IR-1585; EPA-600/7-79-243) Avail: NTIS HC A04/MF A01 CSCL 04A

The atmospheric visibility-reducing aerosol in the Southwest was experimentally characterized with respect to particle size composition, and contribution to light scattering. Measurements were taken within the mixing layer using the instrumented Beechcraft Queen Air aircraft. The aircraft was equipped to measure and record on magnetic tape the light-scattering coefficient, Aitken nuclei count, size distribution, ozone, sulfur dioxide, nitrogen oxides, temperature, dew point, turbulence, pressure (altitude), and navigational parameters. Multistage impactor and size-fractionated filter samples were also collected in order to determine aerosol elemental composition as a function of size. Visual range estimates were obtained by viewing distant landmarks and verified by optical photography. GRA

SPATIAL VARIABILITY OF OZONE AND OTHER POLLUTANTS AT ST. LOUIS, MISSOURI
Thomas R. Karl Oct. 1979 42 p refs
(PB80-132830; EPA-600/4-79-063) Avail: NTIS HC A03/MF A01 CSCL 04A

At a network of 25 aerometric stations, ozone (O3) and various other photochemical pollutants, as well as carbon monoxide, were analyzed with respect to their spatial variability. Data were analyzed for April, through October of 1975 and 1976, periods during which high O3 concentrations are common. Topics addressed include the representativeness of pollutant concentrations spatially averaged over some grid scale with respect to the actual concentrations observed in the atmosphere, variations of stationary point measurements in space in and around metropolitan areas, and the number of fixed point measurements necessary to designate the area of highest O3 concentrations.

THUNDERCLOUD ELECTRIFICATION MODELS IN ATMOSPHERIC ELECTRICITY AND METEOROLOGY
Lee W. Parker Mar. 1980 37 p refs
(Contract NAS8-33467)
(NASA-CR-161441) Avail: NTIS HC A03/MF A01 CSCL 04B

A survey is presented of presently-available theoretical models. The models are classified into three main groups: (1) convection models, (2) precipitation models, and (3) general models. The strengths and weaknesses of the models, their dimensionalities and degrees of sophistication, the nature of their inputs and outputs, and the various specific charging mechanisms treated by them, are considered. In results obtained to date, the convection models predict no significant electrification enhancement based on conductivity gradients and convection alone, with the assumed air circulation patterns. Results of the precipitation models show that the initial electrification can occur rapidly and stably through noninductive collision mechanisms involving ice, and breakdown-strength electric fields can relatively easily be achieved subsequently through the collisional-inductive mechanism. A critical difficulty of the collision mechanisms is imprecise knowledge of relaxation times versus contact times, which can easily lead to overestimates of electrification. The general model results tend to support those of the precipitation models in emphasizing the high potential effectiveness of the collisional-inductive mechanism.

ICE CRYSTAL GROWTH IN A DYNAMIC THERMAL DIFFUSION CHAMBER

Vernon W. Keller May 1980 216 p refs
(Grants NSF ATM-75-10935; NSF ATM-77-07995)
(NASA-TP-1651) Avail: NTIS HC A10/MF A01 CSCL 04B

Ice crystals were grown in a supersaturated environment produced by a dynamic thermal diffusion chamber, which employed two horizontal plates separated by a distance of 2.5 cm. Air was circulated between and along the 1.2 m length of the plates past ice crystals which nucleated and grew from a fiber suspended vertically between the two plates. A zoom stereo microscope with a magnification which ranged from 3X to 80X and both 35 mm still photographs and 16 mm time lapse cine films taken through the microscope were used to study the variation of the shape and linear growth rate of ice crystals as a function of the ambient temperature, the ambient supersaturation, and the forced ventilation velocity. The ambient growth conditions were varied over the range of temperature 0 to -40 C, over the range of supersaturation 4% to 50% with respect to ice, and over the range of forced ventilation velocities 0 cm/s to 20 cm/s. A TIME VARIABLE MODEL OF EARTH'S ALBEDO Final Report

Fred L. Bartman Mar. 1980 123 p
(Grant NsG-1482)
(NASA-CR-159259) Avail: NTIS HC A06/MF A01 CSCL 04B

A time variable model of Earth's albedo was prepared for use in climate studies and as an aid to the interpretation of satellite Earth radiation budget data. The features of the model include: a 10 deg latitude 10 deg longitude grid for numerical integration, surface albedo specified at 1 month intervals, calculation of zenith angle effect for surface albedo and of the additional effect of the atmosphere on the albedo. Percent cloud cover is specified for 29 different climatological cloud type regions at 8 times of the day for 12 months of the year. Cloud albedos were specified for each of the cloud climatological types. Diurnal and monthly variations of this model are described and results are compared with a model which is based on satellite measurements. A computer program was also written for use in studying the sampling effects in satellite radiation budget measurements. An example of the results of calculations with this program are compared with a previous study of the sampling effects. This program for satellite orbit characteristics is to be combined with the time-variable albedo model for further study of the sampling problem. J.M.S.

NUMERICAL METHODS FOR SOLUTION OF THE SHALLOW-WATER EQUATIONS IN METEOROLOGY Ph.D. Thesis

I. M. Navon Jun. 1979 249 p refs
(CSIR-SR-WISK-10) Avail: NTIS HC A11/MF A01

The system of partial differential equations representing motion in a homogeneous, incompressible and nonviscous fluid in hydrostatic equilibrium with a free surface is dealt with. This system, referred to in meteorology as the shallow water equations system or the primitive barotropic equations system, provides an approximation to large scale weather prediction equations having the same numerical characteristics. Methods for solving this system with improved accuracy or high computational efficiency are studied. Several numerical aspects of this system quasilinear hyperbolic partial differential equations, viewed as a mixed initial boundary value problem, are highlighted. The long term behavior of the shallow water equations systems in the inviscid limit is related to the conservation of a number of integral invariants, in particular conservation of potential enstrophy. The paramount importance of well posed numerical boundary conditions as a prerequisite for the success of limited area integrations of the shallow water equations systems is shown. E.D.K.

RADIOMETRIC MEASUREMENTS BY THE MIDAS 3 SYSTEM AT KEY WEST. VOLUME 1: CLOUD BACKGROUNDS Final Report

Al Geiser and Charlie Dippel Sep. 1979 143 p refs
(Contract N60530-79-C-0031; ZF32392002)
(AD-A081052; TR-79-001215) Avail: NTIS HC A07/MF A01 CSCL 17/5

This report describes the test equipment, test procedures, test site and test results for a program to measure the infrared signatures of a representative sample of cloud backgrounds and aircraft at Key West, Florida. Data on various clouds were gathered between April 26 and May 10, 1979, and data on F-4 and F-14 aircraft were gathered between June 4 and June 19, 1979. The MIDAS 3 radiometer was used to measure the infrared signatures of the aircraft during the day and a number of different types of cloud backgrounds at various times of the day and night and at various angles with respect to the sun. The MIDAS 3 System is a small-field scanning radiometer that makes simultaneous measurement of infrared sources in the 3-5 and 8-13 micrometer spectral regions. The 3-5 spectral region is further sub-divided into smaller spectral bands by inserting various spectral filters in front of the 3-5 detector.GRA

ATLANTIS 2 CRUISE 102 MOORED AND SHIPBOARD SURFACE METEOROLOGICAL MEASUREMENTS DURING JASIN 1978

Melbourne G. Briscoe, Carol A. Mills, Richard F. Payne, and Kenneth R. Peal Dec. 1979 93 p refs
(Contract N00014-76-C-0197; Grants NSF OCE-77-25803; NSF OCE-76-80174; NR Proj. 083-400)
(AD-A080732; WHOI-79-43) Avail: NTIS HC A05/MF A01 CSCL 04/2

During cruise 102 of the R/V Atlantis-II in the Joint Air-Sea Interaction Project (JASIN), surface meteorological data were gathered by Woods Hole Oceanographic Institution personnel from two moored buoys and from the ship. One buoy (JASIN W2/WHOI 651) carried a Vector Averaging Wind Recorder (VAWR) and a Vector Measuring Wind Recorder (VMWR); these instruments provided 18 days of intercomparison data and 38 days of meteorological data from 30 July to 6 September 1978. The other buoy (JASIN H2) carried a VMWR and gave 25 total days of data from 16 July to 10 August, and from 26 August to 1 September. A PET computer, hardwired to sensors positioned on the ship, displayed data that were logged during both legs of the cruise. Manual data were gathered by the science watches. This report describes the PET system, and displays and compares all the data. VAWR hourly meteorological data are listed for the 38 day period. Scientific interpretation of these data, such as calculations of heat fluxes, will be published separately. GRA

DIURNAL VARIATIONS OF COASTAL STRATUS

Thomas Frederick Lee Jun. 1979 60 p refs
(AD-A080951; PMTC-TP-80-02) Avail: NTIS HC A04/MF A01 CSCL 04/2

Diurnal dissipation of stratus over and off the southern California and Baja California coasts during two months of July is measured using GOES visual imagery. Morning inland penetration of the eastern stratus margin is favored in coastal valleys and restricted by hills. Afternoon dissipation of the margin away from land usually occurs the length of the coast, with the breadth of clearing being large off southern California, but limited

both north of Point Arguello and south of San Diego. Decreased frequency of stratus ceilings in the southern California bight seems to be related to subsidence in the lee of the Santa Ynez Mountains to the north. With 850 mb wind flow from north and east (340-159 deg), which favors lee subsidence, this region was more often stratus free than for flow from south and west (160-339 deg). GRA

DEFORMATION OF THE MARINE INVERSION AND THE DEVELOPMENT OF MARINE FOG AND STRATUS RESULTING FROM WARM WATER PATCHES, NUMERICAL MODELING AND VERIFICATION WITH SATELLITE IMAGERY

C. William Roger and James T. Hanley. Nov. 1979. 32 p. refs.
(Contract N00014-79-C-0459)
(AD-A081089; CALSPAN-6512-M-1) Avail: NTIS
HC A03/MF A01 CSCL 04/2

The results presented here represent the initial application of a numerical model, designed originally to study snow storms occurring downwind of a warm lake, to stratus/fog systems occurring downwind of the warm water patches in the ocean. Major differences between the two applications include: (1) an order of magnitude difference in inversion heights, with the base of the marine layer inversion being typically a few hundred meters above the surface and (2) air-water temperature differences of a couple of degrees centigrade over the ocean compared to 5-15 C over the lake. Using observed sea surface temperature patterns and meteorological conditions as input, Lavoie model simulations reproduce quite well the location and orientation of the major axis of the cloud field and predict a maximum in liquid water content near the bright core of the observed cloud. The location of the seaward edge of the cloud pattern is reproduced but with somewhat less skill than for the other cloud field features. This limited feasibility study has demonstrated that a significant potential exists for developing a stratus cloud-fog forecasting method based on a suitably modified version of the Lavoie model which uses satellite imagery as the basic input. STATISTICAL RETRIEVAL OF TEMPERATURES FROM SCR-B, AT 10 TO 0.4 MB. Final Report, 1 Jan. 1978 - 31 Jan. 1979

D. N. Hovland and R. W. Wilcox. Mar. 1979. 46 p. refs.
(Contract F49620-78-C-0036; AF Proj. 2310)
(AD-A077359; AFOSR-79-1091TR) Avail: NTIS
HC A03/MF A01 CSCL 04/2

The purpose of this first phase of a study on the morphology of planetary waves was to estimate global temperatures for the upper stratosphere and lower mesophere from the radiances of the SCR-B experiment on Nimbus 5. This has been successfully achieved using a regression of the radiances on meteorological rocket data. In general, the accuracy of the retrieved temperatures, i.e., standard deviation of the error, varies from about 3 K at 10 mb to about 5.5 K at 0.4 mb as compared to meteorological rocket values. Layer mean temperatures are about one-half degree more accurate than temperatures at the bordering levels. Details of the procedure, which included extensive prior preparation of the radiances, are given here. Global temperatures at 10, 5, 2, 1 and 0.4 mb along the orbit, and the mean temperatures (thicknesses) between the levels, are now ready to apply to the next phase of this study, which will obtain heights of those surfaces at latitude-longitude gridpoints. The planetary waves will be computed from these gridpoint values. GRA

THE TURBULENT FLUXES OF MOMENTUM AND SENSIBLE HEAT OVER THE OPEN SEA DURING MODERATE TO STRONG WINDS. Ph.D. Thesis

William George Large. Aug. 1979. 195 p. refs.
(Contracts N00014-76-C-0446; N00014-66-C-0447; NR Proj. 083-207)
(AD-A081392) Avail: NTIS HC A09/MF A01 CSCL 04/2

Two systems for remote measurements of the air-sea fluxes of momentum, sensible heat and moisture during moderate to strong winds are described. One employs the dissipation method and the other the Reynolds flux or eddy correlation method. A modified Gill propeller-vane anemometer is the velocity sensor and a method of resolving the vertical velocity component that accounts for the propeller's non-cosine behavior and avoids its non-linear operating region is derived. The dynamic responses of the sensors are found from measurements in the actual turbulent conditions of the flux measurements. The results of an experiment on the Bedford tower, a stable platform moored in 59m of water 10 km offshore, are presented. Spectra, cospectra, turbulence statistics and transfer coefficients are calculated from the Reynolds flux velocity and temperature data and found to be comparable to previously reported values. Simultaneous dissipation and Reynolds flux estimates of both the momentum and sensible heat fluxes in up to 20 m/s winds are shown to be in excellent agreement. Also presented are the results of a second experiment where the systems were deployed on the weathership CCGS Quadra. A comparison of ship and tower drag coefficients from the dissipation system, demonstrates that the Bedford tower is essentially an open ocean site. GRA

HC A09/MF A01 CSCL 04/1

Sferics counts were used to estimate the incidence of lightning discharges; study the relationship of lightning-flash density to thunderstorm days; and explore the variability to cloud-to-ground discharges. Areal and global discharge incidence estimates were generated from sferics, yielding a global estimate of 1.3 times ten to the minus 5th power /Sq km/s. Gridded monthly values are given for much of the Eastern Hemisphere. The Southern Hemisphere tropics were found to have a average incidence of discharge than the Northern Hemisphere tropics. The linear regression relationship between flash density and thunder storm days indicated lower estimates of flash density when based on data stratifications compared to previous studies. Selected data from the Eastern Hemisphere were studied by linear regression techniques for causes of large-scale variability of cloud-to-ground discharges. In order of importance the regressors were the height of freezing level, the planetary geomagnetic index, a parameterization of the height of the freezing level, precipitable water in 1000-850 mb layer, the dew-point depression at 850 mb, the K index of stability, and the departure of the H-component of the magnetic force vector from its mean. EXPERIMENTAL INVESTIGATION OF AN INEXPENSIVE SKY TEMPERATURE MEASURING DEVICE. Final Report, 1 Jun. 1977 - 30 Jun. 1979

S. Karaki and P. Brothers. Aug. 1979. 23 p. refs.
(Contract EG-77-S-02-4522)
(COO-4522-1) Avail: NTIS HC A02/MF A01

Efforts were made to develop a simple approach for determining clear sky temperature from ground air temperature and absolute humidity and to develop an inexpensive device for direct measurement of sky temperature. The analytical approach

taken was similar to that developed by Bliss. A model to estimate sky temperature to acceptable accuracy, however, was not achieved. A simple device to measure sky temperature was designed and tested but development efforts within the means of the project were unsuccessful. It was concluded that a device that could include measurement or knowledge of the convective heat transfer coefficient rather than control or elimination of it would be an alternative approach in the development of a sky temperature measurement device. RECOMMENDED CHANGES IN METEOROLOGICAL MEASUREMENT AND PREDICTION METHODS FOR COASTAL SITES
Gilbert S. Raynor, Paul Michael, and S. SethuRaman. 1980. 5 p. refs. Presented at the 2nd Conf. on Coastal Meteorology (AMS), Los Angeles, 31 Jan. - 1 Feb. 1980.
(Contract EY-76-C-02-0016)
(BNL-26840; CONF-800107-2) Avail: NTIS HC A02/MF A01

Meteorological measurement programs and atmospheric transport and diffusion prediction models for nuclear power plants were evaluated to determine their adequacy for plants located in coastal zones for changes to improve current procedures. Recommendations for changes to improve current procedures, based on an extensive literature review and on studies of coastal meteorology and diffusion are discussed. The following areas were highlighted in the evaluation: coastal internal boundary layers; tower location; instrument heights; atmospheric stability classification; plume meander and diffusion calculations. HAWAII WIND POWER SURVEY: FIXED STATION DATA
C. S. Ramage, N. E. Oshiro, and S. T. Yokogawa. Dec. 1979. 66 p. refs. Sponsored in part by Kauai County Council, Maui County, Hawaii.
(Grant EG-77-G-03-1617)
(UHMET-79-15) Avail: NTIS HC A04/MF A01

Winds were measured at windy locations in the Hawaiian Islands for periods ranging from 9 to 40 months. Careful calibration and comparison with the nearest airport measurements allow for correction of elimination of bad data. The differences were sufficiently small to justify computing speed and power density, and diurnal variations of wind speed and power density for each station. A significant area on each island possesses high annual wind power (power density at 50 m (164) AGL exceeding 400 W/sqm). The monitoring of the strong wind area of northwest Molokai, until now sampled only during a mobile survey, is outlined. Plans include making detailed measurements of the turbulence characteristics and the vertical profile of the wind in each of the major strong wind areas. DOE

DETECTION OF CLEAR-AIR TURBULENCE BY WATER VAPOUR EMISSION VARIATIONS: TRANSMITTANCES AND WEIGHTING FUNCTIONS. Final Report
Aug. 1979. 32 p.
(Grant NOAA-04-78-1301-20)
(PB80-130339; NOAA-79110204) Avail: NTIS HC A03/MF A01 CSCL 04B

A model of a water vapor disturbance (assumed to be caused by clear air turbulence) in the stratosphere or upper troposphere was used to investigate the changes in emission along a slant path which an aircraft detector would view when encountering such a disturbance ahead of the aircraft. Transmittances for the 260/cm to 500/cm spectral region were calculated along slant paths assuming detector viewing angles above the horizon of from 0.5 degrees to 10 degrees. Weighting functions in terms of the transmissance rate of change with eater path and the radiance rate of change with time were investigated for water vapor increases in a disturbance of 10 ppm. The predicted radiance changes were compred with known radiometer sensitivities and with actual observed changes. GRA

VALIDATION OF OCEAN TIDE MODELS FROM SATELLITE ALTIMETRY. Interim Progress Report, May - Oct. 1978
R. D. Brown. 15 Oct. 1979 36 p. refs.
(Contract N00014-79-C-0409)
(AD-A078294) Avail: NTIS HC A03/MF A01 CSCL 08/3

Tides in the deep ocean can be determined directly from satellite altimetry, completely independent of assumptions about earth tides, bottom topography and coastal geometry and thus free of the uncertainties which plague numerical tide models. Existing tide models differ by 1 meter or more in the value of sea surface height in the deep ocean at a given place and time. This uncertainty is a formidable obstacle to determination of a precise marine geoids from satellite altimetry. By harmonic analysis of the temporal changes in altimeter measurements at satellite subtrack crossover points, it is possible to solve for the amplitude and phase of harmonic tidal components. However, care must be exercised in the removal of satellite orbit errors, and in the selection of crossovers for sufficient observability of the phase angle of the harmonic tidal component. Preliminary tidal solutions in the Gulf of Alaska using the relatively sparse GEOS-3 altimeter data distribution show generally good agreement (20 cm in amplitude and 25 degrees in phase) with deep ocean bottom pressure gauge measurements and establish the feasibility of this technique. SEASAT altimeter data yields a much greater density of crossovers (400 plus per 1/2 deg by 1/2 deg areal, making possible much better separation of individual harmonic components within the semi-diurnal and diurnal families. (CONF-790631-12) Avail: NTIS HC A02/MF A01

An ocean model which is advanced beyond the current state of the art was developed. Characteristics of the model include: a second moment turbulence closure model capable of accurate prediction of small scale turbulent mixing and derivative ocean features such as mixed layer temperature and depth; an algorithm which calculates the external (tidal) mode separately from the internal mode; a sigma coordinate system with 20 levels in the vertical independent of depth; and coding deliberately designed for modern array processing computers. Some preliminary tests of the model as applied to the Gulf of Mexico are described.

CALIFORNIA SEA GRANT COLLEGE PROGRAM: AN OVERVIEW 1977 - 1978
1979. 29 p.
(Grant NOAA-04-7-158-44121)
(PB80-127988; IMR-79-102; SG-68; NOAA-79112109) Avail: NTIS HC A03/MF A01 CSCL 05I
An overview of the 1977-78 California Sea Grant Program is presented. The report addresses three themes that are among the foremost issues facing society today: ecology, technology, and cooperation. The scientific investigations reported range from the broadly fundamental to the sharply practical. The educational and advisory efforts described are critical to developing a common understanding of the potential of the ocean and the implications of developing that potential.

PHOTOCHEMISTRY AND ENZYMOLOGY OF PHOTOSYNTHESIS Progress Report
Richard Redmer. 30 Jul. 1979. 100 p. refs.
(Contract EY-76-C-02-3326)
(COO-3326-82) Avail: NTIS HC A05/MF A01
Three basic problems are addressed: (1) the effect of different preparative procedures on various photosynthetic reactions, with particular emphasis on photosystem II reactions in corn bundle sheath chloroplasts; (2) the development and testing of photosystem II assays; and (3) studies of the stoichiometry of electron carriers in bundle sheath chloroplasts, and whether cyclic phosphorylation could be a major pathway in this tissue. The instruments and techniques to be used in investigating the problems are discussed.

STUDIES OF PHOTOSYNTHETIC MEMBRANES USING CHLOROPHYLL FLUORESCENCE LIFETIMES Ph.D. Thesis
Grace Toy Brewington. Sep. 1979. 189 p. refs.
(Contract W-7405-eng-48)
(LBL-9795) Avail: NTIS HC A09/MF A01
Using a single photon counting system with spark discharge excitation, the in vivo fluorescence kinetics in samples that had been treated with DCMU/NH2OH, ferricyanide, dithionite, background actinic illumination, and different cations in the buffer were investigated. From the studies it was concluded that: (1) fluoresence at the F sub o level does not arise from pigments that are not connected to the PS II reaction center; (2) a puddle model is inadequate to explain these data; (3) these data can be accommodated by a model in which tau sub 1 arises from the chlorophyll a of the chlorophyll a/b light harvesting complexes, and tau sub 2 arises from chlorophylls more directly affected by the PS II reaction center, such as the PS II chlorophyll a antenna; and (4) the fluorescence lifetime data for samples treated with sodium or magnesium ion are consistent with the models of spillover and alpha change. The fluorescence lifetime behavior in chloroplasts as a function of the redox state of the primary acceptor of PS II was also studied.

EFFECT OF HYDROGEN CHLORIDE ON THE MORPHOLOGY OF BACILLUS SUBTILIS SPORES
H. L. M. Lelieveld. 1979. 10 p. refs. Submitted for publication.
Avail: NTIS HC A02/MF A01
Gaseous hydrogen chloride, in the presence of a minute amount of water vapor, rapidly inactivates bacterial spores. Scanning electron microscopy showed that the treatment caused spores of Bacillus subtilis to collapse. Based on modern theories of spore structure and resistance, it is likely that hydrogen chloride inactivates, and causes the collapse of spores by breaking disulphide bonds in coat protein and neutralizing, by protonation, peptidoglycan carboxyl groups in the underlying cortex.

STERILIZATION BY MEANS OF HYDROGEN CHLORIDE: INFLUENCE OF PROCESS PARAMETERS ON THE BIOCIDAL ACTIVITY
H. L. M. Lelieveld and H. M. J. vanEijk. 1979. 40 p. refs. Submitted for publication.
Avail: NTIS HC A03/MF A01
At ambient temperatures, hydrogen chloride is a strong bactericide. At a partial hydrogen chloride pressure of 30 mmHg, the number of spore bearing colony forming units present in straw-dust particles of 0-32 micrometers was reduced by a factor of more than 50,000 within 60 sec. Naked spores of Bacillus subtilis were reduced in viability by a factor of 100,000 within only 10 sec. Viability of vegetative cells of various kinds of bacteria was reduced by a factor of more than 10 to the 7th power within 10 sec. The manner of administration of the gas influenced the sterilization and must be adapted to the geometry of the surfaces to be sterilized. Increases in treatment time and concentration of hydrogen chloride enhanced the sterilizing effect to a lesser extent when large dust particles were involved. The partial water vapor pressure did not influence the sterilization between 0.3 and 6 mmHg. An increase in temperature decreased the sterilizing effect.

PULSE TRANSDUCER WITH ARTIFACT SIGNAL ATTENUATOR Patent
Wilbur H. Cash, Jr. (Martin Marietta Aerospace, Denver) and John T. Polhemus, inventors (to NASA) (Martin Marietta Aerospace, Denver). Issued 22 Apr. 1980. 4 p. Filed 26 Jul. 1978. Supersedes N78-28339 (16 - 19, p. 2520). Sponsored by NASA
(NASA-Case-FRC-11012-1; US-Patent-4,198,988; US-Patent-Appl-SN-928137; US-Patent-Class-128-666; US-Patent-Class-128-690) Avail: US Patent and Trademark Office CSCL 06B
An artifact signal attenuator for a pulse rate sensor is described. The circuit for attenuating background noise signals is connected with a pulse rate transducer which has a light source and a detector for light reflected from blood vessels of a living body. The heart signal provided consists of a modulated

dc signal voltage indicative of pulse rate. The artifact signal resulting from light reflected from the skin of the body comprises both a constant dc signal voltage and a modulated dc signal voltage. The amplitude of the artifact signal is greater and the frequency less than that of the heart signal. The signal attenuator circuit includes an operational amplifier for canceling the artifact signal from the output signal of the transducer and has the capability of meeting packaging requirements for wrist-watch-size packages. TIME FOR RECOVERY FROM SUCCESSIVE BOUTS OF EXERCISE AS MEASURED BY CHANGES IN THE ANAEROBIC THRESHOLD: A COMPARISON OF RECOVERY INTERVALS OF 24 AND 48 HOURS Ph.D. Thesis
Jeffrey Mark Broida 1979 194 p
Avail: Univ. Microfilms Order No. 8010467

The time course for recovery from successive bouts of prolonged and fatiguing exercise was examined to determine if a measure of anaerobic threshold (AT) could be used to differentiate the degree of recovery from exercise frequencies of 3.5 and 7 days per week in which the recovery times were 48 hours and 24 hours respectively. It was concluded that the AT level will decrease if an individual exercises too often with insufficient time for recovery to be complete. Twenty-four hours of recovery time is not sufficient during the first few weeks of prolonged exercise training if the activity consists of running for 45 minutes. Twenty-four hours of recovery time may be sufficient for the 'trained' individual whose physiological mechanisms have had time to adapt. This adaptation period may take from 3 to 6 weeks. Training at the AT either 3.5 or 7 days per week for 45 minutes each session will not increase the AT in a period of 9 weeks. The results of this study indicated that the AT holds potential for being a sensitive indicator of underlying physiological changes resulting from exercise. Dissert. Abstr.

CORONARY PLEXUS IN MAN AND MONKEY Ph.D. Thesis
Arthur James Jackson 1979 116 p
Avail: Univ. Microfilms Order No. 8010147

The distribution of autonomic nerve fibers in relation to the coronary arteries and their branches is examined, and axon terminals in the region of arterioles and capillaries are identified. The left and right coronary plexuses were studied, macroscopically, in seven human hearts and three monkey (Macaca Mulatta) hearts with the aid of a binocular dissecting microscope. In addition, the coronary arteries and their branches with the adjacent myocardium, from a stump-tail (Macaca Arctoides) and Rhesus monkey, were studied by transmission electron microscopy with and without the 'false neurotransmitter, 5-hydroxydopamine. The results suggest that if the coronary arteries are subject to autonomic control, it may be at the level of the capillary bed. Dissert. Abstr.

RELATIONSHIP BETWEEN URINARY 3-METHYLHISTIDINE EXCRETION AND COMPONENTS OF BODY COMPOSITION IN MAN Ph.D. Thesis
Henry Charles Lukaski 1979 124 p
Avail: Univ. Microfilms Order No. 8010079

The relationship between urinary 3-methylhistidine (3-Mehis) excretion and components of body composition was studied in 14 men (mean age 25.2 years). Based on energy and protein intakes derived from seven day dietary records, the subjects were given a meat diet for the first four days and a meat-free diet for the next seven days. Body weight was measured daily and all urine was collected daily and analyzed for creatinine, urea nitrogen, and 3-Mehis. Densitometry and skinfold measurements were performed and total body potassium (TBK), nitrogen (TBN), and water (TBW) were determined. During the meat-free diet, urea nitrogen output was constant, indicating no increase in protein catabolism, creatinine excretion was variable, and 3-Mehis reached its lowest level, endogenous output, on day three. 3-Mehis was more closely related to muscle weight ($r = 0.91$; p less than 0.001) calculated from measurements of TBK and TBN than to free fat ($r = 0.81$; p less than 0.001) calculated from densitometry. It is concluded that because endogenous 3-Mehis is closely and significantly related to muscle weight in man, it can be used to study skeletal muscle protein degradation provided that the necessary dietary restrictions are observed. Positron emission computed tomography (PCT) represents an important new tool for the noninvasive evaluation and, more importantly, quantification of myocardial performance. Most currently available techniques permit assessment of only one aspect of cardiac function, i.e., myocardial perfusion by gamma scintillation camera imaging with Thallium-201 or left ventricular function by echocardiography or radionuclide angiocardiography. With PCT it may become possible to study all three major segments of myocardial performance, i.e., regional blood flow, mechanical function, and most importantly, myocardial metabolism. Each of these segments can either be evaluated separately or in combination. The principles and technological advantages of the imaging device are described. Currently available radioactive tracers and how they can be employed for the assessment of flow, function and metabolism are reviewed. Possible applications of PCT for the study of cardiac physiology of its potential role in the diagnosis of cardiac disease are discussed. DOE

STUDY OF THE POSSIBLE EFFECTS OF 110 kHz ELECTROMAGNETIC FIELDS ON HUMANS
Sep. 1979 71 p refs
(Contract EY-76-C-04-0789)
(SAND-77-7028) Avail: NTIS HC A04/MF A01
The effects of the magnetic field on humans, in particular those wearing pacemakers, was investigated using pacemakers inserted in a simulated (phantom) human being. The tests performed were on a worst case basis. That is, for one set of tests the most sensitive of the several cardiac pacemakers tested was used in the simulated human being (phantom) tests. Furthermore, the largest observed pacemaker lead pickup area was used with the most sensitive pacemaker, and in some of the tests the pacemaker lead was oriented for maximum pickup with the phantom being placed in the strongest magnetic field. A discussion of the types of the tests as well as the electrical pickup mechanism is given. The results are presented and discussed in relation to the development of an electronic, remotely detected credential for personnel identification within security areas. R.E.S.

A DISCRIMINANT ANALYSIS OF PILOT PERFORMANCE PREDICTION AND SELECTION FOR AIR-TO-AIR COMBAT Ph.D. Thesis
Dwight Wilson Polk 1979 108 p
Avail: Univ. Microfilms Order No. 8010554
Data from Southeast Asian conflict were partitioned into five epochs. Four sets of discriminant functions based on training and experience factors were derived. Each set of functions was obtained from the data of a particular epoch and was used to predict the results of a subsequent epoch. Predicted and actual results provided the basis for determining the effectiveness of computed discriminant functions in predicting successes and failures in decisive engagements. For the majority of the cases studied discriminant functions predicted results correctly in approximately the same proportions as a random classification process. However, when air combat maneuvering training of tactical flying experience were used to predict results in an early period of the conflict, the discriminant function predictions exceeded random classifications in accuracy by better than ten percent. In the last period of the conflict, flight position which

is actually a pseudo training and experience factor because of the confounding of training and experience information within it was an effective indicator of engagement outcomes. These results are consistent with a tactical analysis of the conflict.

CLARIFICATION PROCESS: RESOLUTION OF DECISION-PROBLEM CONDITIONS
Duncan L. Dieterly. May 1980. 24 p. refs.
(NASA-TM-81193; AFHRL-H-80-101; A-8162) Avail: NTIS HC A02/MF A01 CSCL 05J

A model of a general process which occurs in both decisionmaking and problem-solving tasks is presented. It is called the clarification model and is highly dependent on information flow. The model addresses the possible constraints of individual indifferences and experience in achieving success in resolving decision-problem conditions. As indicated, the application of the clarification process model is only necessary for certain classes of the basic decision-problem condition. With less complex decision problem conditions, certain phases of the model may be omitted. The model may be applied across a wide range of decision problem conditions. The model consists of two major components: (1) the five-phase prescriptive sequence (based on previous approaches to both concepts) and (2) the information manipulation function (which draws upon current ideas in the areas of information processing, computer programming, memory, and thinking). The two components are linked together to provide a structure that assists in understanding the process of resolving problems and making decisions.

PREPARATION COST AND DUAL-TASK PERFORMANCE: FURTHER EVIDENCE AGAINST A GENERAL TIME-SHARING FACTOR
Harold L. Hawkins, Elizabeth Ollich-Rodriquez, Thomas O. Halloran, R. Daniel Ketchum, David B. Bachmann, and Gerald M. Reicher. Aug. 1979. 38 p. ref.
(Contract N00014-77-C-0643; NR Proj. 150-407)
(AD-A080857; TR-5) Avail: NTIS HC A03/MF A01 CSCL 05/8

The time-sharing performance of 12 pilot trainees and 12 subjects with no pilot training was evaluated on 8 dual-task and 4 single-task conditions. Three task characteristics-input modality (auditory or visual), output modality (vocal or manual), and task difficulty (easy or difficult)--were systematically manipulated across conditions in an effort to vary the nature of the specific time-sharing demands imposed. To assess their generality, time-sharing factors were correlated across task conditions. A factor was considered general if it correlated across conditions imposing dissimilar time-sharing demands. The result suggest that (a) neither an ability to time-share efficiently nor an ability to effectively prepare for multiple tasks is a general factor in dual-task performance, and (b) effective preparation for multiple tasks is a skill that increases with piloting experience.

A DYNAMICALLY RECONFIGURABLE DISTRIBUTED COMPUTING SYSTEM. Ph.D. Thesis
Charles Ralph Vick. 1979. 245 p.
Avail: Univ. Microfilms Order No. 8008385

A distributed architecture is described which integrates the fundamental concepts and qualities of pipelining and parallel processing into the basic structure. The architecture is a network of processors where each node in the network is called a

computing station (CS) and executes a well defined single entry - single exit procedure. It may be considered a type of data flow architecture in that packets of data called data item state vectors (DI SV's), trigger a given CS that not only operates on the data to produce a transformation but routes it to the next appropriate CS in the network. The routing function is not necessarily deterministic at design time, but may depend on the content of the given DI SV and the procedure within the CS that operates on it. Dissert. Abstr.

(Contract F30602-79-C-0046; AF Proj. 2338)
(AD-A081464; RADC-TR-79-199-Pt-1) Avail: NTIS
HC A09/MF A01 CSCL 09/2

The implementation feasibility of a nonlinear system identification technique is evaluated in this report. The identification technique uses a 'black box' approach requiring measurements only at system input and output terminals and is applicable to weakly nonlinear systems whose behavior is adequately characterized by a finite Volterra series. Three hardware implementations of the identification technique are postulated and their respective performances are evaluated. The impact of A/D converter quantization error, non-ideal amplifiers, multipliers and integrators on performance of the identification process is assessed. Performance requirements for each of the three implementations are derived via simulation and analysis. The feasibility of implementing the technique using commercially available state of the art components and measurement equipment in each implementation is assessed. RADC-TR-79-199, Part 2, A computational complexity study of the identification technique processing to determine the class of nonlinear systems to which the technique can be practically applied will be published at a later date. Current directions of computer science and computing in general are toward more parallel machine architectures and distributed models of computing based upon these new architectures. Recently, there has been considerable interest in highly parallel architectures capable of supporting complex distributed computation via a large number of autonomous processors. ZMOB is such a machine, currently under design and simulation. Architecturally, ZMOB is a collection of 256 identical but autonomous Z80A-based microcomputers (processors). Each processor comprises 32K bytes of 375 ns read/write central memory (expandable to 48K bytes), up to 4K bytes of resident operating system on 450ns EPROM, an 8-bit hardware multiplier, and interface logic for communications functions. HC A10/MF A01 CSCL 09/2

The design, analysis and performance evaluation of the architecture of a mutiprocessor is presented. The architecture is a hierarchically structured, functionally distributed, multiple microcomputer system. Its operating system is a multi-level structure implemented in an optimal combination of hardware, firmware, and software. This architecture is suited to any application, such as process control or real-time system simulation, in which the basic computational tasks do not change in time. Control functions are distributed among the microcomputer; however, the scheduling and execution of these tasks is governed at each microcomputer level by a local, real-time operating system. This local operating system is implemented primarily in firmware to minimize overhead. However, the control structure is designed to be independent of implementation so that a variety of microcomputers can be utilized together. Moreover, it is possible to add to each local processor an additional subprocessor which implements the operating system. GRA

HC A11/MF A01 CSCL 09/2

The class of multistage interconnection networks with the configuration is introduced as a reverse-exchange interconnection network which is shown to be a powerful interconnection network for the parallel processing system. A recursive formula is derived to calculate the control pattern of the network for each of four realizable permutation classes. The recursive formulas can provide superior operating speed over the existing routing algorithms. It is proven that all permutations can be realized by the reverse-exchange network in two passes. Both the construction and routing algorithms are provided. Our results compares favorably with those of other networks. GRA

OPTIMUM DIGITAL DATA STORAGE ON MAGNETIC TAPE
E. L. Law and W. R. Hedeman, Jr. Washington Naval Air Systems Command Dec. 1979 15 p
(AD-A081049; PMTC-TP-80-03) Avail: NTIS
HC A02/MF A01 CSCL 09/2

In recent years considerable effort has been expended on high density digital recording. The goal has been to increase the data storage per unit length of tape, usually focused on a fixed track width. The present investigation advances the thesis

that optimum data storage per square of tape is achieved by increasing the number of tracks, rather than the storage per track. An experimental method for the determination of the best operating point is described, and data is presented for Non-Return-to-Zero-Level (NRZ-L), Manchester and Miller codes for an ideal tape recorder, and also for an actual tape recorder. GLOBAL PROGRAM ANALYSIS IN AN INTERACTIVE ENVIRONMENT Ph.D. Thesis
Larry Melvin Masinter 1980 113 p
Avail: Univ. Microfilms Order No. 8011678

The implementation and characteristics of a programming tool, called SCOPE. The program which aids programmers in dealing with large programs is described. SCOPE analyzes a user's programs, remembers what it sees, answers questions based on the facts it remembers, and incrementally updates its data base when a piece of the program changes. A variety of program analysis techniques are used within SCOPE to extract different kinds of information from programs. Examples include cross reference information, flow analysis, and data type inference. At the foundation, SCOPE embodies a representation system, in which properties of pieces of programs can be expressed. Representation systems are characterized by the entities they describe, the kind of facts they can contain and the manner in which the facts are derived. The basic entity which SCOPE deals with is the definition of a symbol, e.g., the definition of a procedure, record type, or macro. In particular, the facts SCOPE stores are not about individual statements of a program but rather about the definitions of symbols. Dissert. Abstr.

TECHNIQUES FOR PROGRAM VERIFICATION Ph.D. Thesis
Charles Gregory Nelson 1980 122 p
Avail: Univ. Microfilms Order No. 8011683

Two problems related to program verification are examined: choosing algorithms and data structures for the 'low-level' parts of a mechanical theorem prover that reason about important primitive operations such as equality, linear inequalities, and functions for operating on arrays and ordered pairs; and choosing a formal system that is suitable for reasoning about programs that manipulate pointers. The main result on the first problem is a method for combining 'satisfiability procedures' for two logical theories into a single satisfiability procedure for the combination of the theories. A satisfiability procedure is a program that determines the satisfiability of conjunctions of literals (signed atomic formulas). Implementation of the method in a theorem prover is described. The suggested solution to the second problem is that the specification language of the verification system be extended to allow nondeterministic partial recursive function definitions. A formal system is described for coding, specifying, and verifying programs that manipulate pointers. Dissert. Abstr.

AN INTERACTIVE COMPUTER PROGRAM FOR SIZING SPACECRAFT MOMENTUM STORAGE DEVICES
F. J. Wilcox, Jr. Mar. 1980 40 p refs
(NASA-TM-81798) Avail: NTIS HC A03/MF A01 CSCL 09B

An interactive computer program was developed which computes the sizing requirements for nongimbled reaction wheels, control moment gyros (CMG), and dual momentum control devices (DMCD) used in Earth-orbiting spacecraft. The program accepts as inputs the spacecraft's environmental disturbance torques, rotational inertias, maneuver rates, and orbital data. From these inputs, wheel weights are calculated for a range of radii and rotational speeds. The shape of the momentum wheel may be chosen to be either a hoop, solid cylinder, or annular cylinder. The program provides graphic output illustrating the trade-off potential between the weight, radius, and wheel speed. A number of the intermediate calculations such as the X-, Y-, and Z-axis total momentum, the momentum absorption requirements for reaction wheels, CMG's, DMCD's, and basic orbit analysis information are also provided as program output. SOLVING STAIRCASE LINEAR PROGRAMS BY THE SIMPLEX METHOD. 2. PRICING
Robert Fourer Nov. 1979 70 p refs
(Contract N00014-75-C-0267; DE-AS03-76SF-00326; Grants NSF MCS-76-20019; NSF ENG-77-0671)
(AD-A080838; SU-SOL-79-19) Avail: NTIS HC A01 CSCL 12/2

This and a companion paper share one goal: to solve staircase-structured linear programs faster through adaptation of the algorithms of the modern simplex method. Their means are quite different however, whereas the preceding paper concentrated on 'inversion' algorithms that factorize the basis and solve linear systems, the present paper looks are 'pricing' algorithms that select a variable to enter the basis at each iteration. Pricing involves two sets of algorithms: computation algorithm that determine reduced costs of the nonbasic variables, and selection algorithms that choose among variables whose reduced costs are favorable. This paper develops staircase adaptations of both sorts of algorithms, and reports extensive (although preliminary) computational experience. Staircase computation algorithms appear to offer modest but consistent savings; staircase selection algorithms, properly chosen, may offer substantial savings in number of iterations, time per iteration, or sometimes both. COMMENTS ON KHACHIAN'S ALGORITHM FOR LINEAR PROGRAMMING
George B. Dantzig Nov. 1979 7 p refs
(Contract N00014-75-C-0267; DE-AS03-76SF-00326; Grants NSF MCS-76-81259; NSF MCS-76-20019; NSF ENG-77-06761)
(AD-A080837; SU-SOL-79-22) Avail: NTIS HC A02/MF A01 CSCL 12/2

Khachian's polynomial bound for finding a feasible solution to a relaxed linear program is an important theoretical result. Unfortunately, a polynomial bound does not imply a good algorithm because such a bound could be too large for problems of practical interest. For example, using the formulae in the original paper, practical problems with 3000 non-negative variables and 1000 equations (which are solved under one-half hour on IBM 370-168 using the simplex method) would involve over 10 to 15th power iterations and would take 50,000,000 years to solve using Khachian's method. AUTOMATIC FACTORIZATION OF GENERALIZED UPPER BOUNDS IN LARGE SCALE OPTIMIZATION PROBLEMS M.S. Thesis
David Samuel Thomen Sep. 1979 45 p refs
(AD-A081761) Avail: NTIS HC A03/MF A01 CSCL 12/1

To solve contemporary large scale linear, integer and mixed integer programming problems, it is often necessary to exploit intrinsic special structure in the model at hand. One commonly used technique is to identify and then to exploit in a basis factorization algorithm a generalized upper bound (GUB) structure (also called a static signed identity basis factorization). This report compares several existing methods for identifying GUB structure. Computer programs have been written to permit comparison of computational efficiency. The GUB programs have been incorporated in an existing optimization system of advanced design and have been tested on a variety of large scale real life optimization problems. The identification of GUB sets of maximum size is shown to be among the class of NP-complete problems; these problems are widely conjectured to be intractable in that no polynomial-time algorithm has been demonstrated for solving them. All the methods discussed in this report are polynomial-time heuristic algorithms that attempt to find, but do not guarantee, GUB sets of maximum size. Bounds for the maximum size of GUB sets are developed, in order to evaluate the effectiveness of the heuristic algorithms. GRA

A RANDOM SAMPLER OF DYNAMIC PROGRAMMING APPLICATIONS IN SIGNAL PROCESSING AND CONTROL
Louis L. Scharf and Howard Elliott Dec. 1979 8 p refs
Presented at the 13th Ann. Asilomar Conf. on Circuits, Systems and Computers, 5-7 Nov. 1979 Sponsored in part by the Army Research Office and the Office of Naval Research
(AD-A081485; CSU-TR-DEC79-1) Avail: NTIS HC A02/MF A01 CSCL 12/1

Three classical problems, discrete Fourier analysis, linear prediction, and nonlinear phase and frequency demodulation are used to illustrate the use of dynamic programming in control and signal processing. The first two problems illustrate the use of dynamic programming in the (re-) derivation of the FFT and Levinson algorithms, two of the best known and most widely used fast algorithms. The last problem illustrates how dynamic programming can provide comfort in those applications where recursively computable, finite dimensional sufficient statistics are nowhere to be found. GRA

TRANSFORMING STATIC DATA STRUCTURES TO DYNAMIC STRUCTURES Interim Report
James B. Saxe and Jon Louis Bentley 3 Sep. 1979 70 p refs
(Contract N00014-76-C-0370)
(AD-A081438; CMU-CS-79-141) Avail: NTIS HC A04/MF A01 CSCL 12/1

In this paper we will investigate transformations that serve as tools in the design of new data structures. Specifically, we study general methods for converting static structures (in which all elements are known before any searches are performed) to dynamic structures (in which insertions of new elements can be mixed with searches). We will exhibit three classes of such transformations, each based on a different counting scheme for representing the integers, and then use a combinatorial model to show the optimality of many of the transformations. Issues such as online data structures and deletion of elements are also examined. To demonstrate the applicability of these tools, we will study six new data structures that have been developed by applying the transformations. GRA

USING EXECUTIVE ASSERTIONS FOR TESTING
D. M. Andrews and J. P. Benson Nov. 1979 8 p refs
(Contract F49620-79-C-0115; AF Proj. 2304)
(AD-A081488; GRC-TM-2282; AFOSR-80-0127TR) Avail: NTIS HC A02/MF A01 CSCL 09/2

One of the ways of assuring greater reliability of software is to improve testing techniques. Three of the key problems associated with software testing are: choosing adequate test cases, assuring correctness of the results, and reducing, the high cost of testing. Some degree of automation is required to help solve these problems. By combining the automated capability of adaptive testing with the use of executable assertions, it is possible to execute a program with a large number of test cases over a wide range of input values. The usual goal of adaptive testing is to maximize some performance value (objective function) for the software by automated perturbation of the input parameters. This technique only indirectly leads to locating errors, because of the time-consuming tasks of examining the usual output from the program. In software testing, the primary goal is to locate the maximum number of errors rather than maximize the

performance value. Since software errors can be detected by executable assertions, these assertions can be used to define an objective function for the Adaptive Tester so that a program can be tested automatically and a mapping made of its 'error space.' A search algorithm is used to generate new test cases based on past performance data about the number of assertion violations. Software testing can become much more efficient and effective through the use of adaptive testing with assertions, because such extensive testing increases the possibility of finding any existing errors and of improving software reliability. GRA

CONCURRENT MANIPULATION OF BINARY TREES, REVISION Interim Report

H. T. Kung and Philip L. Lehman Sep. 1979 46 p refs Revised

(Contract N00014-76-C-0370; Grant NSF MCS-78-23676)

(AD-A081443; CMU-CS-79-145-Rev) Avail: NTIS HC A03/MF A01 CSCL 09/2

The concurrent manipulation of a binary search tree is considered in this paper. The systems presented can support any number of concurrent processes which perform searching, insertion, deletion, and rotation(reorganization) on the tree, but allow any process to lock only a constant number of nodes at any time. Also, in the systems, searches are essentially never blocked. The concurrency control techniques introduced in the paper include the use of special nodes and pointers to redirect searches, and the use of copies of sections of the tree to introduce many changes simultaneously and therefore avoid unpredictable interleaving. Methods developed in this paper may provide new insights to other problems in the area of concurrent database manipulation. GRA

AN ANALYSIS OF SOFTWARE DESIGN METHODOLOGIES Technical Progress Report, 3 Oct. 1977 - 3 Dec. 1978

H. Rudy Ramsey, Michael E. Atwood, and Gary D. Campbell Aug. 1979 124 p refs

(Contract DAHC19-78-C-0005; DA Proj. 2Q7-62725-A-778)

(AD-A081319; SAI-79-104-DEN; ARI-TR-401) Avail: NTIS HC A06/MF A01 CSCL 09/2

Four formal software design methodologies were described and briefly analyzed: (1) Structured Design, (2) Jackson's Methodology, (3) Integrated Software Development System (Higher Order Software), and (4) Warnier's: Logical Construction of Programs; strengths, weaknesses, and commonalities among the methods were identified and human factors problem areas were analyzed. Several major human factors deficiencies and problems were identified. Formal software design methods differ in terms of: Applicability to problems of different types, size or complexity; susceptibility to design errors; and constraints and limitations imposed on the software designer. Various methods limit the designer's ability to select an appropriate problem representation, prevent the designer from utilizing relevant knowledge and experience, or impose potentially significant information loads on the designer. Improvements in design methodologies require a better understanding of the problem-solving behavior of software designers; potential research topics in this area were identified. GRA

A PROJECTED LAGRANGIAN ALGORITHM FOR NONLINEAR MINIMAX OPTIMIZATION

Walter Murray and Michael L. Overton Nov. 1979 74 p refs

(Contracts DAAG29-79-C-0110; DE-AS03-76SF-00326; DE-AT03-76ER-72018; Grant NSF MCS-76-20019)

(AD-A081069; SU-SOL-79-2115; ARO-16470.5-M) Avail: NTIS HC A04/MF A01 CSCL 12/1

The minimax problem is an unconstrained optimization

problem whose objective functions is not differentiable everywhere, and hence cannot be solved efficiently by standard techniques for unconstrained optimization. It is well known that the problem can be transformed into a nonlinearly constrained optimization problem with one extra variable, where the objective and constraint functions are continuously differentiable. This equivalent problem has special properties which are ignored if solved by a general-purpose constrained optimization method. The algorithm we present exploits the special structure of the equivalent problem. A direction of search is obtained at each iteration of the algorithm by solving a equality-constrained quadratic programming problem, related to one a projected Lagrangian method might use to solve the equivalent constrained optimization problem. Special Lagrangian multiplier estimates are used to form an approximation to the Hessian of the Lagrangian function, which appears in the quadratic program. Analytical Hessians, finite-differencing or quasi-Newton updating may be used in the approximation of this matrix. The resulting direction of search is guaranteed to be a descent direction for the minimax objective function. Under mild conditions the algorithms are locally quadratically convergent if analytical Hessians are used. GRA

A GLOBALLY CONVERGENT CONDENSATION METHOD FOR GEOMETRIC PROGRAMMING

Eric Rosenberg Oct. 1979 28 p refs

(Contracts DAAG29-79-C-0110; DE-AS03-76SF-00326; DE-AT03-76ER-72018; Grant NSF MCS-76-20019)

(AD-A081067; SU-SOL-79-11; ARO-16470.2-M) Avail: NTIS HC A03/MF A01 CSCL 12/1

To solve a posynomial geometric program, rather than solve its dual directly, one solves the duals of a sequence of approximating geometric programs. Each approximating program, obtained by condensing certain terms of the given problem, has fewer degrees of difficulty than the given problem. Therefore, this method is to solve a sequence of problems, each posed in the same low dimensional space, rather than solve one problem in a higher dimensional space. The method requires a special sub-matrix of the matrix of exponents, and procedures to find such a sub-matrix are presented. A line search on an exact penalty function is employed. Under mild conditions, from any arbitrary starting solution estimate the method generates a sequence of estimates converging to a solution. The method also generates a sequence of lower bounds, thus providing an effective stopping criterion. A numerical example is presented. GRA

TASK REDUCTION SYSTEMS

H. J. Boom Mar. 1978 15 p refs Submitted for publication

(MC-IW-95/78) Avail: NTIS HC A02/MF A01; Stichting Math. Centrum, Amsterdam FL 3

The essential computational dependencies in a problem to be programmed can be expressed as a 'task replacement system' which indicates how tasks can be accomplished if other tasks are first accomplished. Associating good order with a suitable task replacement system can provide a constructive proof that an algorithm exists for solving a problem, without actually requiring the effort of writing a program. The method is demonstrated with simple examples. Author (ESA)

LOGICAL INVESTIGATIONS ON PTQ ARISING FROM PROGRAMMING REQUIREMENTS

T. M. V. Janssen Nov. 1978 34 p refs Submitted for publication

(MC-ZW-117/78) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 4

Investigations on intensional logic which were stimulated by the development of a computer program for Montague's 'The Proper Treatment of Quantification in Ordinary English' are dealt with. Some problems which arose during the design of the algorithm of the program are considered and special attention is paid to the logical reduction rules which are used to simplify the expressions of intensional logic. An explicit list of these rules is presented with a strategy for their application. The correctness of these rules is proved together with some related results. Finally, several illustrative examples of generated sentences are considered and some inaccuracies and omissions in Montague's article are indicated. Author (ESA)

A COMPARISON OF BOUNDS OF DELSARTE AND LOVASZ

A. Schrijver Oct. 1978 17 p refs Submitted for publication

(MC-ZW-118/78) Avail: NTIS HC A02/MF A01; Stichting Math. Centrum, Amsterdam FL 3

Two upper bound functions are compared: Delsarte's linear programming bound (an upper bound for the cardinality of cliques in association schemes) and Lovasz's theta-function (an upper bound for the Shannon capacity of a graph). It is shown that the two bounds can be treated in a unified fashion. Delsarte's linear programming bound can be generalized to a bound theta prime (G) for the independence number alpha (G) of arbitrary graphs G, such theta prime that (G) is less than or equal to

theta (G). On the other hand, if the edge set of G is the union of some classes of a symmetric association scheme, theta (G) may be calculated by means of linear programming. It is shown that for such graphs G the product theta (G) dot theta (bar G) is equal to the number of vertices of G. Author (ESA)

CONTROL OF ENTRY TO A QUEUEING SYSTEM Ph.D. Thesis
Robert Charles Rue 1979 237 p
Avail: Univ. Microfilms Order No. 8010094

A semi-Markov approach is used to formulate an expanded M/M/1 model with several classes of customers, each with its own reward and holding cost rate. Socially optimal control of this model is shown to be provided by establishing a balking point for each class that is no greater than the balking point a member of the class would determine if he acted to maximize his own expected net benefit. A semi-Markov approach is also used to extend the several class model to include service times. A heuristic solution technique based on policy iteration and a solution technique using mixed integer programming are presented. The several class models are applied to the problem of determining an optimal policy for controlling the entry of commerical aircraft to the landing queue at an international airport. A socially optimal control policy is found and analyzed. Finally, the semi-Markov approach is used to formulate three other models: (1) a nonpreemptive priority model; (2) a class dependent service rate model; (3) a nonpreemptive priority model with class dependent service rates. Dissert. Abstr.

QUEUEING NETWORKS
Ralph L. Disney Dec. 1979 35 p refs
(Contract N00014-77-C-0743; Grant NSF ENG-77-22757; NR Proj. 042-296)
(AD-A081257; VTR-79-23) Avail: NTIS MF A03/MF A01 CSCL 12/1

The study of queueing networks is a rather recent addition to queueing theory. In this paper we will review about the last 20 years of developments in the area. Primary emphasis is placed on Jackson networks and the major contribution of Kelly. We discuss queue length processes, waiting time processes, busy period processes and departure processes. We will also note a few new studies that have appeared in the area of network flows. Topics that are not discussed in detail in the paper are briefly noted in the final section. The bibliography can serve as an introduction for further reading in the area. GRA

SOME RESULTS ON SOJOURN TIMES IN ACYCLIC JACKSON NETWORKS, REVISION
Burton Simon and Robert D. Foley Dec. 1978 16 p refs Revised
(Contract N00014-77-C-0743; Grant NSF ENG-77-22757)
(AD-A080737; VTR-79-01-Rev) Avail: NTIS HC A02/MF A01 CSCL 12/1

Studies are made on sojourn times in acyclic, Jackson networks as part of a survey of equilibrium results. Argument is made that a particular customer has a sojorun time at node i that is independent of his remaining sojourn time in the network given that the customer transfer from node i to node j. This assumption is then used to derive a set of equations involving the Laplace-Stieltjes transform of the sojourn times at each node from which several properties of sojourn times are determined. ON OPTIMISTIC METHODS FOR CONCURRENCY CONTROL Interim Report
H. T. Kung and John T. Robinson Oct. 1979 21 p refs
(Contract N00014-76-C-0370; Grant NSF MCS-78-23676)
(AD-A081452; CMU-CS-79-149) Avail: NTIS HC A02/MF A01 CSCL 09/2

Most current approaches to concurrency control in database systems rely on locking of a data objects as a control mechanism. In this paper, two families of non-locking concurrency controls are presented. The methods used are ('optimistic' in the sense that rely mainly on transaction backup as a control mechanism, 'hoping' that conflicts between transactions will not occur. Applications where these methods should be more efficient than locking are discussed. GRA

THE M/G/1 QUEUE WITH INSTANTANEOUS BERNOULLI FEEDBACK Technical Progress Report, period ending 1979
Ralph L. Disney, Donald C. McNickle (Univ. of Canterbury, New Zealand), and Burton Simon Dec. 1979 22 p refs
(Contract N00014-75-C-0492)
(AD-A081256; VTR-79-22) Avail: NTIS HC A02/MF A01 CSCL 12/1

This report concerns with several random processes that occur in M/G/1 queues with instantaneous feedback in which the feedback decision process is a Bernoulli process. Queue length processes embedded at various times are studied. It is shown that these do not all have the same asymptotic distribution, and that in general none of the output, input, or feedback processes is renewal. These results have implications in the application of certain decomposition results to queueing networks. GRA

AN ALGORITHM FOR AVERAGE COSTS DENUMERABLE STATE SEMI-MARKOV DECISION PROBLEMS WITH APPLICATIONS TO CONTROLLED PRODUCTION AND QUEUEING SYSTEMS
H. C. Tijms Oct. 1978 36 p refs Submitted for publication
(MC-BW-94/78) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 4

A computational approach is presented for typical applications of average costs denumerable state semi-Markov decision problems as arising in controlled production and queueing systems. This approach combines policy-iteration and embedding techniques to develop, by exploiting the structure of the application considered, a tailor-made algorithm for computing an optimal policy within a given class of intuitively reasonable policies having a simple form. An M/G/1 queueing system with controllable service time distribution, a discrete production problem in which the inventory is controlled by turning on or off the production, and an M/M/c queueing system in which the number of servers operating can be controlled are considered as applications. THE STRUCTURE OF MINIMAL GRAPHS WITH GIVEN ABELIAN AUTOMORPHISM GROUP Ph.D. Thesis
William Charles Arlinghaus 1979 216 p
Avail: Univ. Microfilms Order No. 8010117

The cycle structure of permutation groups is investigated, and necessary conditions are established for a permutation to represent an automorphism in a graph with abelian group. Candidates are constructed for minimal graphs with given cyclic group, and the above conditions are utilized to show that these candidates are indeed minimal. These methods are then used to find minimal graphs for abelian p-groups, first with two generators, and then (using induction) with an arbitrary number of generators. In general, these are suggested by the minimal graphs of the cyclic groups associated with the generators. The one class of exceptions is thoroughly developed. Finally, the results are extended to all abelian groups. Thus a complete classification is provided for minimal graphs with given finite abelian automorphism group. Dissert. Abstr.

BOUNDARY CONDITIONS FOR THE NUMERICAL SOLUTION OF ELLIPTIC EQUATIONS IN EXTERIOR REGIONS

Alvin Bayliss, Max Gunzburger (Tennessee Univ.), and Eli Turkel (New York Univ.) [1980] 47 p refs

(Contracts NAS1-14101; Contracts DAAG29-78-C-0024; EY-76-C-02-3077)

(NASA-CR-153185; Rept-80-1) Avail: NTIS HC A03/MF A01 CSCL 12A

Elliptic equations in exterior regions frequently require a boundary condition at infinity to ensure the well-posedness of the problem. Examples of practical applications include the Helmholtz equation and Laplace's equation. Computational procedures based on a direct discretization of the elliptic problem require the replacement of the condition on a finite artificial surface. Direct imposition of the condition at infinity along the finite boundary results in large errors. A sequence of boundary conditions is developed which provides increasingly accurate approximations to the problem in the infinite domain. Estimates of the error due to the finite boundary are obtained for several cases. Computations are presented which demonstrate the increased accuracy that can be obtained by the use of the higher order boundary conditions. The examples are based on a finite element formulation but finite difference methods can also be used. Author

FINITE CRITERIA FOR CONDITIONAL DEFINITENESS OF QUADRATIC FORMS

D. H. Martin Aug. 1979 20 p refs Sponsored in part by Control Data Corp.

(CSIR-TWISK-115) Avail: NTIS HC A02/MF A01

Finite criteria, involving the solution of sets of linear equations constructed from the matrices Q.A (Q symmetric and n x n, A is m x n), for testing two types of conditional definiteness are presented. The real symmetric n x n matrix Q is A-conditionally positive semidefinite, where A is a given m x n real matrix, if x prime Q x > or = 0 whenever Ax > or = 0, and is A-conditionally positive definite if strict inequality holds except when x = 0. When A is the identity matrix these notions reduce to the well studied notions of copositivity and strict copositivity respectively. The criteria developed generalize known facts about copositive matrices, and, when Q is invertible and all rowsubmatrices of A have maximal rank, can be very elegantly stated in terms of Schur complements of the matrix AQ (-1) A prime. M.G.

UNIFORM LINEAR APPROXIMATION IN NORMED LINEAR SPACES

M. Brannigan Aug. 1979 17 p refs

(CSIR-TWISK-114) Avail: NTIS HC A02/MF A01

It was shown that the theory of H-sets is important in the characterization of best uniform approximation of continuous real- or complex-valued functions. The theory of H-sets is extended to the more general setting of functions with compact domain and with range contained in a Banach space. Using the definitions of H-sets, a maximal linear functional is constructed and inclusion theorems analogous to the classical case are obtained. It is then a simple matter to deduce a characterization of best approximation and show when uniqueness and strong uniqueness are achieved. F.O.S.

N80-24047# National Research Inst. for Mathematical Sciences, Pretoria (South Africa).

COPOSITIVE MATRICES AND DEFINITENESS OF QUADRATIC FORMS SUBJECT TO HOMOGENEOUS LINEAR INEQUALITY CONSTRAINTS

D. H. Martin and D. H. Jacobson May 1979 43 p refs

(CSIR-TWISK-89) Avail: NTIS HC A03/MF A01

A symmetric matrix C is called copositive if the quadratic form x prime C x is nonnegative for all nonnegative values of the variables (x sub 1, x sub 2,..., x sub n) = x prime o. A known sufficient condition for a quadratic from x prime Qx to be positive unless x = 0, subject to the linear inequality constraints Ax equal to or greater than 0, is that there should exist a copositive matrix C such that Q - A prime CA is positive definite. The main result establishes the necessity of this condition. For x prime Qx to be merely nonnegative subject to Ax equal to or greater than 0, the situation is less straight-forward. The necessity of the existence of a copositive matrix C such that Q - A prime CA is positive semi-definite is proved only under various additional hypotheses regarding the size or rank of A, and counter examples are given to show that, in general, no such matrix may exist, even when Slater's constraint qualification holds. Our approach to these existence questions also furnishes certain tests for positivity or mere nonnegativity in which specific symmetric matrices, constructed by rational operations from A and Q and depending upon a single real parameter nu, must be tested for positive definiteness or strict copositivity for large values of nu. This technique is illustrated by several examples. F.O.S.

WIENER-HOPF APPROACHES TO REGULATOR, FILTER/OBSERVER, AND OPTICAL COUPLER PROBLEMS Final Report

Richard F. Whitbeck Jan. 1980 77 p refs

(Contract N00014-78-C-0391)

(AD-A081489; STI-TR-1125-1; ONR-CR215-260-1) Avail: NTIS HC A05/MF A01 CSCL 12/1

Most approaches to optimal linear stochastic control problems depend on time domain techniques for both their theoretical foundations and for computational algorithms. In contrast, this paper discusses innovations based on classical transform domain Wiener-Hopf theory. These innovations avoid several difficulties occurring in time domain solutions (e.g., those which arise in connection with singular regulator and filter problems). Emphasis will be placed upon solution techniques and properties in distinction to derivations. The following points will be demonstrated: linear regulator, filter/observer problems can be solved using linear algebraic equations (in distinction to solving nonlinear Riccati equations); the R weighting matrix need not be positive definite nor is it necessary that 1/R exists; singular regulator and filter/observer problems (e.g., the cheap control problem) can be handled neatly; the weighting matrices, R and Q, can be explicit functions of frequency; and there are some advantages in using non-diagonal Q and R matrices. HC A05/MF A01 CSCL 12/1

Problems of economic planning, production scheduling, inventory, transportation, control and multi-stage structural design have been modeled as linear programs that have a 'staircase' structure: their activities fall into a sequence of disjoint stages or periods, while their constraints relate only successive periods. At one time it was hoped that staircase linear programs would be particularly easy to solve, owing to their special structure, but experience with the most common solution technique, the general simplex method, has shown otherwise. Over the years many alternatives to the simplex method have also been proposed, but as yet none of these has been proved superior in solving a wide variety of staircase problems. This and a companion paper consider how the modern simplex method, as implemented for large computers, may be adapted to solve staircase linear programs more efficiently. Each paper looks at a set of algorithms within the simplex method: this one deals with 'inversion' of the basis - more accurately, solution of linear systems by Gaussian elimination and its successor considers the task of pricing. ON THE COMPUTATIONAL COMPLEXITY OF BRANCH AND BOUND SEARCH STRATEGIES M.S. Thesis
Douglas R. Smith Nov. 1979 111 p refs
(Grant NSF MCS-74-14445)
(AD-A081608; NPS52-79-004) Avail: NTIS
HC A06/MF A01 CSCL 12/1

Many important problems in operations research, artificial intelligence, and other areas of computer science seem to require search in order to find an optimal solution. A branch and bound procedure, which imposes a tree structure on the search, is often the most efficient known means for solving these problems. While for some branch and bound algorithms a worst case complexity bound is known, the average case complexity is usually unknown despite the fact that it gives more information about the performance of the algorithm. In this dissertation the branch and bound method is discussed and a probabilistic model of its domain is given, namely a class of trees with an associated probability measure. The best-bound-first search strategy and depth-first search strategy are discussed and results on the expected time and space complexity of these strategies are presented and discussed. The best-bound-first search strategy is shown to be optimal in both time and space. These results are illustrated by data from randomly generated traveling salesman problems. GRA

EIGENVALUE AND NEAR EIGENVALUE PROBLEMS SOLVED BY BRANDT'S MULTIGRID METHOD Interim Report, May - Jun. 1979
K. G. Guderley and Donald S. Clemm (AFFDL, Wright-Patterson AFB, Ohio) Sep. 1979 29 p ref
(Grant AF-AFOSR-3524-78; AF Proj. 2304)
(AD-A081318; AFFDL-TR-79-3147) Avail: NTIS
HC A03/MF A01 CSCL 12/1

To illustrate Brandt's multigrid method this report considers the Helmholtz equation in cases where the frequency is close to an eigenfrequency. In a second part the eigenvalue problem is discussed. The basic idea for the treatment of the inhomogeneous problem is contained in Brandt's publications. Difficulties are encountered because the coarse grid eigenvalues differ from those of the finer grid. As a consequence, approximations to a solution in the coarse grid may differ widely from the corresponding approximation in a finer grid, if the frequency defined by the inhomogeneous problem is close to one of the eigenfrequencies. This may be detrimental to the aim of the coarse grid step; namely to remove from an approximation in a fine grid long waves which cause divergence of fine grid iterations. This is remedied by eliminating long wave contributions to the residual directly in the next finer grid. The success of this procedure still depends upon the choice of the subspace from which the long wave corrections in the finer grid are taken. Even this modified method fails if the frequency pertaining to the inhomogeneous term is too close to an eigenvalue, unless the subspace contains the pertinent eigenfunction. GRA

HC A04/MF A01 CSCL 12/1

This report presents a suboptimal boundary estimation algorithm for noisy images which is based upon an optimal maximum likelihood problem formulation. Both the maximum likelihood formulation and the resulting algorithm are described in detail, and computational results are given. In addition, the potential power of the likelihood formulation is demonstrated through the presentation of three simple but insightful analyses algorithm performance. GRA

HC A08/MF A01 CSCL 12/1

Many computational problems are inherently geometrical in nature. For example, cluster analysis involves construction of convex hulls of sets of points, LSI artwork analysis requires a test for intersection of sets of line segments, computer graphics involves hidden line elimination, and even linear programming can be expressed in terms of intersection of half-spaces. As larger geometric problems are solved on the computer, the need grows for faster algorithms to solve them. The topic of this thesis is the use of geometric transforms as algorithmic tools for constructing fast geometric algorithms. We describe several geometric problems whose solutions illustrate the use of geometric transforms. These include fast algorithms for intersecting half-spaces, constructing Voronoi diagrams, and computing the Euclidean diameter of a set of points. For each of the major transforms we include a set of heuristics to enable the reader to use geometric transforms to solve his own problems. GRA

HC A03/MF A01 CSCL 12/1

This report contains two independent papers on problems concerned with graph embedding, i.e., assignment of the vertices of a graph to points in a metric space subject to specified constraints. The first paper in this report, 'Embeddability of weighted graphs in k-space is strongly NP-hard,' examines the problem of assigning the vertices of a weighted graph to points

in a k-dimensional Euclidean space subject to the constraint that any two vertices connected by an edge must be assigned to points whose distance is the weight of that edge. We prove (by reduction from 3-satisfiability) that it is NP-hard to determine whether such an assignment exists, even when k=1 and the edge weights are restricted to take on the values 1 and 2. The same reduction used in this proof forms the basis of proofs of the NP-completeness of several variants of the original problem. The second paper, 'Dynamic-programming algorithms for recognizing small-bandwidth graphs in polynomial time,' deals with the problem of bandwidth minimization, in which we are given a graph, G, and a positive integer, k, and whether it is possible to assign the vertices of G to distinct integers subject to the constraint that no edge of G may have its endpoints mapped to integers which differ by more than k. Although the general problem has been proven (by C. H. Papadimitriou) to be NP-complete, we show that it can be solved in polynomial time for any fixed value of k. As in the first paper, the methods used to achieve the principal result are extended to a number of related problems. GRA

ALGORITHMS FOR TESTING CONVEXITY OF DIGITAL POLYGONS. Interim Report

Reinhard Klette and E. V. Krishnamurthy. Dec. 1979. 22 p. refs

(Grant AF-AFOSR-3271-77; AF Proj. 2304)

(AD-A081476; TR-841; AFOSR-80-0138TR) Avail: NTIS HC A02/MF A01 CSCL 12A

A simple approach based on Shoenberg's theorem is described to test whether a set of border points of a simply 4 connected digital picture is convex. The sequential implementation of this method is linear in the number of points; the parallel algorithm needs constant time only, using bitwise parallel Boolean operations and shifts on binary matrices. Suitable modifications of this approach can be used for decomposing two dimensional objects into convex sets and for filling concavities. GRA

MODERN METHODS OF MULTIPLE SPECTRAL DENSITY ESTIMATION

H. Joseph Newton. Mar. 1979. 17 p. refs

(Contract N00014-78-C-0599)

(AD-A081172; TR-N-8) Avail: NTIS HC A02/MF A01 CSCL 12/1

Methodology for estimating the spectral density of a multiple time series is presented. The windowed and autoregressive methods are described and a new estimator called the periodic autoregressive estimator is proposed. A worked example is given and a Fortran program written by the author is described. GRA

N80-24059# Texas A&M Univ., College Station. Inst. of Statistics.

EFFICIENT ESTIMATION OF MULTIVARIATE MOVING AVERAGE AUTOCOVARIANCES

H. Joseph Newton. May 1979. 5 p. refs

(Contract N00014-78-C-0599)

(AD-A081173; TR-N-9) Avail: NTIS HC A02/MF A01 CSCL 12/1

A method is proposed for estimating the autocovariances of a d-dimensional moving average process of order q. The estimators have the same asymptotic covariance matrix as those obtained by maximizing a Gaussian likelihood, and are obtained by performing a generalized least squares regression of the periodogram on the autocovariance, thus extending Parson's estimators for d=1. J.M.S.

A NUMERICAL METHOD TO INTEGRATE STIFF SYSTEMS OF ORDINARY DIFFERENTIAL EQUATIONS

T. P. Coffee, J. M. Heimerl, and M. D. Kregel. Jan. 1980. 53 p. refs

(DA Proj. 1L1-61102-AH-43)

(AD-A080998; AD-E430374; ARBRL-TR-02206) Avail: NTIS HC A04/MF A01 CSCL 12/1

A method is described for the efficient integration of stiff systems of ordinary differential equations. The method, based on a predictor-corrector formulation, uses the Jacobian in a non-standard fashion. The resulting program is compared with EPISODE, a standard stiff integrator, for a number of systems of ordinary differential equations. The results show that the procedure is usually competitive with EPISODE and is more efficient for some problems. GRA

LINEAR LEAST-SQUARES ANALYSIS AND EFFECTIVE INTERACTIONS

S. D. Bloom, R. F. Hausman, Jr. (LASL), and J. Larsen. Mar. 1979. 11 p. Presented at the (P,N) Reaction and Nucleon-Nucleon Force Conf., Telluride, Colo., 29-31 Mar. 1979

(Contract W-7405-eng-48)

(UCRL-82587; CONF-790348-6) Avail: NTIS HC A02/MF A01

Some results are shown from the application of the method of singular value analysis (SVA), a particular form of linear squares analysis, to two sets of experimental two body matrix elements, the 63 Chung-Wildenthal matrix elements for the 1d5/2, 1d3/2 shells (A approx. equal to 20 to 40) and the best 84 matrix elements from previous work. The latter cover the atomic weight range of A approx. equal to 40 to 200 and nine shells from 1d3/2 to 1f3/2. The purpose is the extraction of a first-order set of strength parameters for an effective interaction of minimum rank and simple form for each set or both sets of data. The ranges, being nonlinear in their effects are investigated separately. Mainly considered are local potential forms, which is not a limitation of the approach. DOE

GLOBAL ERROR ESTIMATION FOR STIFF ODEs
L. F. Shampine Oct. 1979 20 p refs
(Contract EY-76-C-04-0789)
(SAND-79-1587) Avail: NTIS HC A02/MF A01

A method is presented which in some generality, provides a rough estimate of the global error arising in the numerical solution of the initial-value problem for a stiff set of ordinary differential equations (ODEs). The procedure is not rigorously correct like global extrapolation, nor is its justification comparable to that of Stetter's scheme for Adams codes. There is a close relationship between the method and more specialized ones proposed by Robinson and Prothero, and Dew and West. A careful discussion of the most important approximations made in the present paper illuminates the accuracy and reliability of these other methods. DOE

N80-24066# Princeton Univ., N. J. Plasma Physics Lab.
SEPARATING VARIABLES IN TWO-WAY DIFFUSION EQUATIONS
N. J. Fisch and M. D. Kruskal Oct. 1979 43 p refs
(Contract EY-76-C-02-3073)
(PPPL-1596) Avail: NTIS HC A03/MF A01

It is shown that solutions to a class of diffusion equations of the two-way type may be found by a method akin to separation of variables. The difficulty with such equations is that the boundary data must be specified partly as initial and partly as final conditions. In contrast to the one way diffusion equation, where the solution separates only into decaying eigenfunctions, the two way equations seperate into both decaying and growing eigenfunctions. Criteria are set forth for the existence of linear eigenfunctions, which may not be found directly by separating variables. A speculation with interesting ramifications is that the growing and decaying eigenfunctions are separately complete in an appropriate half of the problem domain. DOE

N80-24067# Sandia Labs., Albuquerque, N. Mex. Numerical Mathematics Div.
QUADRATURE SUBROUTINES FOR SPLINES AND B-SPLINES
Donald E. Amos Dec. 1979 12 p refs
(Contract EY-76-C-04-0789)
(SAND-79-1825) Avail: NTIS HC A02/MF A01

Four subroutines (BSQUAD, PPQUAD, BFQUAD, and PFQUAD) for integrating splines and B-splines are described. The subroutine BSQUAD accepts the B-representation in terms of the knot array T(*), the coefficient array BCOEF(*) the number of coefficients N, and the order K to compute integrals on subintervals of T(K) < or = X < or = T (N+1). Distinct knot partition the interval of integration so that polynomial integration by a Gauss quadrature formula can be implemented. The piecewise polynomial form is accepted by PPQUAD which sums polynomial evaluation of integrals on the partition. More general integrals for the product of a function f(x) and a B-spline are computed similarly in subroutines BFQUAD and PFQUAD using a quadrature routine with error control and code structure similar to that in BSQUAD and PPQUAD. DOE

GENERATING ALL MAXIMAL INDEPENDENT SETS: NP-HARDNESS AND POLYNOMIAL-TIME ALGORITHMS
E. L. Lawler (California Univ., Berkeley), J. K. Lenstra, and A. H. G. Rinnooykan (Erasmus Univ.) Apr. 1978 18 p refs Sponsored in cooperation with Netherlands Organization for Advancement of Pure Research (ZWO) Submitted for publication
(Grant NSF MCS-76-17605)
(MC-BW-87/78) Avail: NTIS HC A02/MF A01; Stichting Math. Centrum, Amsterdam FL 2,88

Suppose that an independence system (E,I) is characterized by a subroutine which indicates in unit time whether or not a given subset of E is independent. It is shown that there is no algorithm for generating all the K maximal independent sets of such an independence system in time polynomial in the absolute value of E and K, unless P = NP. However, it is possible to apply ideas of Paull and Unger and of Tsukiyama et al. to obtain polynomial-time algorithms for a number of special cases, e.g., the efficient generation of all maximal feasible solutions to a knapsack problem. The algorithmic techniques bear an interesting relationship with those of Read for the enumeration of graphs and other combinatorial configurations. Author (ESA)

A NONLINEAR VECTOR FINITE DIFFERENCE SCHEME
Paul J. Schweitzer Jun. 1978 10 p refs Submitted for publication
(MC-BW-89/78) Avail: NTIS HC A02/MF A01; Stichting Math. Centrum, Amsterdam FL 3

A nonlinear vector iterative scheme of linear fractional form is investigated. Explicit expressions are given for each vector iterate and for the limiting vector. These equations arise in the bottleneck analysis of closed networks of queues. Author (ESA)

N80-24070# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Operations Research.
NON-STATIONARY MARKOV DECISION PROBLEMS WITH CONVERGING PARAMETERS
A. Federgruen (Rochester Univ.) and P. J. Schweitzer (Rochester Univ.) Aug. 1978 31 p refs Submitted for publication
(MC-BW-90/78) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 3

The solution of Markov decision problems is discussed. Various models are presented in which this situation occurs. It is shown that a modified value-iteration method may be employed in order to solve the optimality equation and to find optimal policies. In both cases the convergence rate is shown to be geometric. The asymptotic behavior of backward products of a geometrically convergent sequence of Markov matrices is characterized. Author (ESA)

N80-24071# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Operations Research.
DENUMERABLES STATE SEMI-MARKOV DECISION PROCESSES WITH UNBOUNDED COSTS, AVERAGE COST CRITERION
A. Federgruen (Leiden Univ.), A. Hordijk, and H. C. Tijms (Vrije Univ.) Sep. 1978 24 p refs Submitted for publication
(MC-BW-92/78) Avail: NTIS HC A02/MF A01; Stichting Math. Centrum, Amsterdam FL 3

An undiscounted semi-Markov decision model with a denumerable state space and compact metric action sets, where the one step expected costs and transition times are allowed to be unbounded, is discussed. The existence of a finite solution to the average costs optimality equation is verified as well as the existence of an average cost optimal stationary policy. Author (ESA)

ONE-STEP SPLITTING METHODS FORMULATED FOR SEMI-DISCRETE PARABOLIC EQUATIONS
P. J. vanderHouwen and J. G. Verwer Apr. 1978 34 p refs Submitted for publication
(MC-NW-55/78) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 3,85

Splitting methods for parabolic equations via the method of lines are discussed, starting with the formulation of these methods for semi-discrete equations such as dy/dt = f(y), f non-linear,

and f satisfying a linear splitting relation f(y) = sum of f sub i(y). A class of one-step integration formulas is defined, which is shown to contain all known splitting methods, provided the functions F sub i are defined appropriately. For a number of methods stability results are given. Secondly, attention is paid to alternating direction methods for problems with an arbitrary nonlinear coupling between space derivatives. Numerical results of those methods are compared with results obtained by a hopscotch method. Author (ESA)

N80-24074# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Numerical Mathematics.
SEMI-DISCRETIZATION METHODS FOR PARTIAL DIFFERENTIAL EQUATIONS ON NONRECTANGULAR GRIDS
K. Dekker May 1978 26 p refs Submitted for publication
(MC-NW-56/78) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 3

A semi-discretization method for two dimensional partial differential equations is presented, applicable to curvilinear meshes. The method yields nine-point approximation formulas for the first and second derivatives of a function. Error estimates for another discretization method are given, and both methods are compared in numerical examples. The new method turns out to be more accurate, whereas the calculation of the weights of the formulas is more time-consuming. Author (ESA)

N80-24075# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Numerical Mathematics.
THE APPLICATION OF ITERATED DEFECT CORRECTION TO THE LOD METHOD FOR PARABOLIC EQUATIONS
J. G. Verwer Aug. 1978 33 p refs Submitted for publication
(MC-NW-58/78) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 4

The numerical solution of the initial boundary value problem for a class of multi-dimensional parabolic partial differential equations is studied. In particular the time-integration of semi-discrete equations is investigated. An attempt is made to develop integration formulas which are computationally attractive and of high accuracy, while possessing unconditional stability properties. To that end iterated defect correction is applied to the LOD method. The convergence properties of this process are investigated. Numerical experiments are reported. Author (ESA)

N80-24076# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Numerical Mathematics.
ON THE STABILITY OF MULTISTEP FORMULAS FOR VOLTERRA INTEGRAL EQUATIONS OF THE SECOND KIND
P. J. vanderHouwen and P. H. M. Wolkenfelt Aug. 1978 21 p refs Submitted for publication
(MC-NW-59/78) Avail: NTIS HC A02/MF A01; Stichting Math. Centrum, Amsterdam FL 3

The stability properties of a class of multistep methods for second kind Volterra integral equations are analyzed. The usual analysis in which the kernel function is a priori restricted to a special class of test functions is followed. In most stability investigations these test functions depend only on the unknown function. In this case it is only required that the kernel function can be separated with respect to its first argument. Stability conditions are derived. It turns out that in the case of linear convolution kernels, the trapezoidal rule may become unstable. Author (ESA)

N80-24077# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Numerical Mathematics.
ERROR BOUNDS FOR EXPONENTIALLY FITTED GALERKIN METHODS APPLIED TO STIFF TWO-POINT BOUNDARY VALUE PROBLEMS
P. P. N. deGroen and P. W. Hemker Sep. 1978 35 p refs Submitted for publication
(MC-NW-62/78) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 4

A linear second order singularly perturbed two point boundary-value problem is considered. Discretization by means of Petrov-Galerkin methods of finite element type, where the trial spaces contain piecewise exponentials, is studied. Error bounds, both pointwise and in the energy norm, are derived. The relation with other special difference schemes is shown and the error bounds obtained are compared with numerical results. Author (ESA)

N80-24078# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Numerical Mathematics.
ON THE STABILITY OF MULTISTEP FORMULAS FOR SYSTEMS OF VOLTERRA INTEGRO-DIFFERENTIAL EQUATIONS
P. J. vanderHouwen, H. J. J. teRiele, and P. H. M. Wolkenfelt Oct. 1978 44 p refs Submitted for publication
(MC-NW-63/78) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 5

The stability behavior of linear multistep methods is analyzed for systems of integro-differential equations of Volterra type which are only restricted by the condition that the kernel function is finitely decomposable. Stability regions are derived for backward differentiation type schemes of orders 2 up to 6 and for the trapezoidal rule. In particular, attention is paid to these schemes when applied to the special integro-differential equation, which arises from differentiating a Volterra integral equation of the second kind. Numerical experiments are reported which confirm the theoretical stability results. Author (ESA)

DFVLR-FB-78-08 DFVLR, Obserpfaffenhofen, West Germany, May 1978 Original report in GERMAN previously announced as N79-30979
(ESA-TT-557; DFVLR-FB-78-08) Avail: NTIS HC A07/MF A01; ZLDI, Munich DM 49.70

The prediction of the dynamic behavior of multibody systems (MBS) is based on computer oriented multibody formalisms. The corresponding computer programs prove to be an efficient tool for treating a great variety of problems. Their broad field of application results from consistent use of the capacity of modern computers. The equations of motion are established by the computer itself, starting from input data, which may be derived easily by the user. The kinematic and dynamic equations of MBS are presented in scalar, computer oriented form. These equations are implemented in the multipurpose computer package MULTIBODY. Its characteristics are demonstrated by considering an example from a typical field of application, such as the simulated deployment of the solar arrays of a geostationary communication satellite. THEORY AND NUMERICAL METHODS OF RESOLUTION OF PARTIAL DIFFERENTIAL EQUATIONS
Pierre Laval Apr. 1980 206 p refs Transl. into ENGLISH of "Theorie et Methodes Numeriques de Resolution des Equations aux Derivees Partielles", Rept. ONERA-NT-1979-2 ONERA, Paris, 1979 Original report in FRENCH previously announced as N80-23073
(ESA-TT-606; ONERA-NT-1979-2) Avail: NTIS HC A10/MF A01

The general properties and the classification of second order partial differential equations are presented as well as systems of higher order. The various classical boundary problems, whether hyperbolic, parabolic or elliptic, are then given in the simple case of the wave, heat and Laplace equations with two independent variables. The finite element method is discussed in terms of two dimensional elliptic or three dimensional parabolic problems. The finite difference methods of pseudo viscosity are evaluated for problems of unsteady compressible flows with shock waves. The implicit splitting up methods (of stabilization, predictor-corrector and desintegration) are formulated for evolution problems. The stabilization method is described for elliptic problems after a review of some iterative methods. Author (ESA)

THE METHOD OF n RANKINGS WHEN THE UNDERLYING DISTRIBUTIONS ARE DISCRETE Ph.D. Thesis
R. Markham Jul. 1979 245 p refs
(CSIR-TWISK-108) Avail: NTIS HC A11/MF A01

The problem of testing the null hypothesis of equal treatment effects, H sub O, in a block design, is studied. Three classes of rank tests are considered, the class of average scores tests, of midrank scores tests, and of randomized ranks tests. The randomized block design, and the balanced incomplete randomized block design are considered as special cases. Special cases of the rank tests are compared with the parametric test by means of their asymptotic relative efficiencies. An asymptotic comparison is also made of the three classes of rank tests. A method is provided for the calculation of the exact powers of the rank tests and several relative efficiency curves are calculated. E.D.K.

SAMPLING REPRESENTATIONS AND APPROXIMATIONS FOR CERTAIN FUNCTIONS AND STOCHASTIC PROCESSES Interim Report

Muhammad Kamel Habib Jan. 1980 102 p refs

(Grant AF-AFOSR-2796-75; AF Proj. 2304)

(AD-A081533; MMS-1260; AFOSR-80-0141TR) Avail: NTIS HC A06/MF A01 CSCL 12/1

Sampling representations and approximations of deterministic and random signals are important in communication and information theory. Finite sampling approximations are derived for certain functions and processes which are not bandlimited, as well as bounds on the approximation errors. Also derived are sampling representations for bounded linear operators acting on certain classes of bandlimited functions and processes; these representations enable one to reconstruct the image of a function (or a process) under a bounded linear operator using the samples of the image. Finally, sampling representations for distributions and random distributions are obtained. GRA

ON THE PERFORMANCE OF LEAST SQUARES ESTIMATORS IN TYPE TWO CENSORED ACCELERATED LIFE TESTS

G. K. Bhattacharyya and Z. Soejoeti Aug. 1979 13 p refs

(Contract N00014-78-C-0722)

(AD-A080912; UWIS-DS-79-576) Avail: NTIS HC A02/MF A01 CSCL 14/4

In context of the analysis of accelerated life testing experiments where items are tested under more severe stress conditions than those arising in normal use, the least squares approach is noted for its simplicity. Expressions are derived for the asymptotic efficiency of the least squares estimators when the failure time data are type II censored. Applications of the general results are made to the Weibull and exponential models and the loss of efficiency is investigated in relation to the severity of censoring and the nature of spread of the design points. GRA

TRANSFORMATION OF A DISCRETE DISTRIBUTION TO NEAR NORMALITY

Fabian Hernandez and Richard A. Johnson Nov. 1979 12 p refs

(Contract N00014-78-C-0722)

(AD-A080886; UWIS-DS-79-546) Avail: NTIS HC A02/MF A01 CSCL 12/1

Utilizing an information number approach, we propose an objective method for the normalization of either discrete distributions, or sample counts, by means of a power transformation. Approximations are also given to the original known probabilities. Next, we derive the large sample distribution of our estimate of the power transformation. We compare our methods with the Box-Cox procedure, applied to observed counts, and conclude that their technique often provides good approximations even though their underlying assumption of normality is clearly violated. Two examples illustrate our methods. GRA

THE SELECTION OF AN EXTREME-VALUE DISTRIBUTION

Fabian Hernandez and Richard A. Johnson Apr. 1979 16 p refs

(Contract N00014-78-C-0722)

(AD-A080884; UWIS-DS-79-544) Avail: NTIS HC A02/MF A01 CSCL 12/1

We consider the problem of transforming a known distribution (or a random sample) to distributions other than the normal. Transformations to the negative exponential distribution are considered but the most interesting version is the extension concerning the selection of a best fitting extreme value distribution. By creating a suitable three parameter family of transformations all three types of extreme value distributions may be considered as candidates. Our sample approach to the selection is based on the marginal posterior distribution of the shape parameter. GRA

THE LARGE SAMPLE BEHAVIOR OF TRANSFORMATIONS TO NORMALITY

Fabian Hernandez and Richard A. Johnson Jan. 1979 22 p refs

(Contract N00014-78-C-0722)

(AD-A080885; UWIS-DS-79-545) Avail: NTIS HC A02/MF A01 CSCL 12/1

We investigate the large sample behavior of both the classical and Bayesian procedures for selecting a transformation to normality. The study of the large sample behavior clearly reveals the role played by the assumptions leading to the Box and Cox procedures. Based on our large sample results, we introduce an information number approach for transforming a known distribution to near normality. This latter procedure provides bench marks for the maximum possible amount of improvement through power transformations. We illustrate our procedure with three examples. Finally, we generalize our procedure to random vectors and linear models situations. GRA

COMBINATORIAL GRAPH EMBEDDING Final Report

R. A. Demillo, S. C. Eisenstat, and R. J. Lipton Jan. 1980 85 p refs

(Grant DAAG29-76-G-0338)

(AD-A081247; GIT-ICS-79/12; ARO-14690.10-EL) Avail: NTIS HC A05/MF A01 CSCL 12/1

Let G, G' be directed graphs. A combinatorial embedding of G into G' is an identification of each x an element of V(G) with a set of vertices S a subset of V(G') such that each S is bounded in size by a constant independent of -V(G)= and each arc in G is carried into a directed path of length bounded by a constant independent of -V(G)=. This concept has formed the basis for a number of theoretical studies and the papers collected here are representative of - with one major exception - the state-of-the-art with regard to graph embedding. TESTING WITH REPLACEMENT AND THE PRODUCT LIMIT ESTIMATOR
R. D. Gill May 1978 26 p refs Submitted for publication
(MC-SW-57/78) Avail: NTIS HC A03/MF A01; Stichting Math. Centrum, Amsterdam FL 3

Let X1, X2,... be a sequence of i.i.d. strictly positive random variables with distribution function F. Define N tilde (t) = the number of j with X sub 1 +...+ X sub j < or = to t. In testing with replacement, n independent copies of N tilde are observed each over the time interval (o,T) and the interest lies in nonparametric estimation of F based on these observations. Consistency is proven of the product limit estimator as n goes to infinity for arbitrary F, and weak convergence for two cases: integer valued X sub i and X sub i with a continuous distribution function. The theory of stochastic integrals is used to do this, and the similarity of the results is explained with those for the product limit estimators in the model of random censorship.

RUN FOR YOUR LIFE. A NOTE ON THE ASYMPTOTIC SPEED OF PROPAGATION OF AN EPIDEMIC
O. Diekmann May 1978 24 p refs Submitted for publication
(MC-TW-176/78) Avail: NTIS HC A02/MF A01; Stichting Math. Centrum, Amsterdam FL 3

The large-time behavior of the solution of a nonlinear integral equation of mixed Volterra-Fredholm type describing the spatio-temporal development of an epidemic is studied. For this model it is known that there exists a minimal wave speed c sub o (i.e., traveling wave solutions with speed c exist if the absolute value of c is greater than c sub o and do not exist if the absolute value of c is less than c sub o). It is shown that c sub o is the asymptotic speed of propagation (i.e., for any c

sub 1, c sub 2 with o less than c sub i less than c sub o less than c sub 2 the solution tends to zero uniformly in the region absolute value of x greater than or = to c sub 2 t, whereas it is bounded away from zero uniformly in the region absolute value of x less than or = to c sub 1 t for t sufficiently large).

THE STRENGTH OF NONSTATIONARY INERATION Interim Report
G. W. Wasilkowski Aug. 1979 30 p refs
(Contract N00014-76-C-0370; Grant NSF MCS-75-22255; NR Proj. 044-422)
(AD-A081450; CMU-CS-79-138) Avail: NTIS HC A03/MF A01 CSCL 12/1

This is the second of three papers in which we study global convergence of iterations using linear information for the solution of nonlinear equations. In Wasilkowski we proved that for the class of all analytic scalar complex functions having only simple zeros there exists no globally convergent stationary iteration using linear information. Here we exhibit a nonstationary iteration using linear information which is globally convergent even for the multivariate and abstract cases. This demonstrates the strength of nonstationary iteration. In Wasilkowski we shall prove that any globally convergent iteration using linear information has infinite complexity even for the class of scalar complex polynomials having only simple zeros. GRA

DISJOINTNESS AND QUASIFACTORS IN TOPOLOGICAL DYNAMICS
J. C. S. P. vanderWoude Nov. 1978 24 p refs Submitted for publication
(MC-ZW-119/78) Avail: NTIS HC A02/MF A01; Stichting Math. Centrum, Amsterdam FL 3

Some results are presented about the disjointness relations between factors, extensions and quasifactors of minimal topological transformation groups (ttg's) with arbitrary phase group and compact Hausdorff phase space. Some families of minimal ttg's are characterized whose members are disjoint from a certain collection of minimal ttg's. For instance it is proven that if the phase group is strongly amenable, then the minimal ttg's, which are disjoint from every PI-ttg, are just the weakly mixing ones.

A COMPARISON OF INTERCONTINENTAL CLOCK SYNCHRONIZATION BY VLBI AND THE NTS SATELLITE Final Report
James A. Buisson (NRL), O. Jay Oaks, Jr. (NRL), Thomas B. McCaskill (NRL), William J. Hurd (JPL), Schulyer C. Wardrip, Hugh E. Warren (Bendix Field Eng. Corp., Columbia, Md.), and Gary G. Whitworth (APL) 4 Jan. 1980 9 p refs
(NRL Proj. R04-16)
(NASA-TM-81063; AD-A081001; AD-E000360; NRL-8366)
Avail: NTIS HC A02/MF A01 CSCL 14/2

The intercontinental clock synchronization capabilities of Very Long Baseline Interferometry (VLBI) and the Navigation Technology Satellite (NTS) have been compared at the NASA Deep Space Net complexes at Madrid, Spain and Goldstone, California. The VLBI experiments used the Wideband VLBI Data Acquisition System developed at the NASA Jet Propulsion Laboratory. The Naval Research Laboratory NTS Satellites were used with NTS Time Transfer Receivers developed by the Goddard Space Flight Center. The two methods agreed to within about 0.5 microseconds. GRA

SIGNAL PROCESSING FOR HIGHER FREQUENCY ULTRASONIC IMAGING Ph.D. Thesis
Douglas Baxter Boyle 1980 118 p
Avail: Univ. Microfilms Order No. 8011612

The use of signal processing methods in medical ultrasonic imagery is discussed. A high speed data acquisition system is used to record signals for subsequent computer analysis. A model of the normal heart is developed. The emphasis is on the frequency dependence of the scattering properties. The reflection coefficient,

acoustic velocity, and thickness of the epicardium are studied. The scattering cross section of the myocardium is also measured. A phantom which has the acoustic properties of th epicardium is described. A set of design equations is developed and used to predict scanner performance. Imaging systems with adjustable frequency and pulse length provide higher performance in varied anatomical environments than conventional fixed frequency, shock excited systems. A combination of higher frequency and longer pulses increases lateral resolution with little cost in volemetric resolution. The use of signal processing methods to increase system sensitivity was studied. Pulse to pulse coherence measurements indicated that coherent processing could be used during certain parts of the cardiac cycle for images of the liver. Dissert. Abstr.

A GENERAL THEORY FOR THE SCATTERING OF SOUND BY SOUND WITH PARAMETRIC ARRAY APPLICATIONS Ph.D. Thesis
Harvey Charles Woodsum 1979 62 p
Avail: Univ. Microfilms Order No. 8007077

A general theory of the scattering of sound by sound, which is exact to second order, was derived in terms of plane wave expansions. The solution involves an extension for the second order scattering of two plane acoustic waves to include the effects of viscosity. The plane wave expansions for the sum and difference frequency components of the second order scattered field were obtained in terms of the fundamanetal solution for the scattering of two plane waves, and the plane wave expansion coefficients for the primary fields. Applications to parametric transmitting and receiving arrays are presented, with advantages being noted in that quite general field geometries can be treated with the plane wave expansion technique. Dissert. Abstr.

NORMAL MODE ACOUSTIC SCATTERING FROM ELASTIC CYLINDRICAL SHELLS Ph.D. Thesis
Edward Darwin Breitenbach 1980 150 p
Avail: Univ. Microfilms Order No. 8010934

Acoustic scattering from a fluid loaded air backed infinite elastic cylindrical shell was examined using partial wave analysis. The partial wave technique was applied to a thick shell, from which dispersion curves are derived for the identified circumferential Rayleigh transverse, and longitudinal modes. The validity of the partial wave analysis was confirmed. A response enhancement method was developed to isolate the elastic resonances excited by the circumferential modes on thick intermediate and thin shells. Specific mode responses were traced through the transition to a thin shell. Mode responses were examined for the continuous order representation at discrete value of ka. Dissert. Abstr.

N80-24128 Brown Univ., Providence, R. I.
THE INTERACTION OF SOUND WITH NOISE IN WATER Ph.D. Thesis
Timothy Kevin Stanton 1979 126 p
Avail: Univ. Microfilms Order No. 8007070

The nonlinear interaction of a monochromatic ultrasonic signal with audio frequency noise was measured in water. The scattered signal lies in sidebands corresponding to the sum and difference components of the frequencies involved. The intensity of the scattered signal increases linearly with interaction distance and quadratically with the signal frequency in the range 1-4 MHz. An estimation of the scattered intensity was made by characterizing the 2.28 kHz component of the noise field in terms of its complex intensity. In each interaction measurement, a continuous wave signal of amplitude less than 0.2 atm was generated in water by a ceramic transducer. After passage through distances up to 90 cm, the beam was detected by a second transducer and fed to a spectrum analyzer. The noise in the medium was provided by a mechanical noise generator striking the metallic wall of the water-filled tank. The noise spectrum lay between 2.8 kHz, with component amplitudes up to 0.005 atm. A wattmeter is described which is capable of measuring separately the real and imaginary parts of the complex acoustic intensity in water. A general expression for the complex intensity is derived and used to provide a basis for the measurements. Dissert. Abstr.

FAR-FIELD RADIATION OF AFT TURBOFAN NOISE
Edward J. Rice and Arthur V. Saule 1980 25 p refs Presented at 99th Meeting of the Acoust. Soc. of Am., Atlanta, 21-25 Apr. 1980
(NASA-TM-81506; e-444) Avail: NTIS HC A02/MF A01 CSCL 20A

Approximate expressions were developed for the noise radiation from the aft duct. The results of approximate aft radiation equation compare favorably to more exact Wiener-Hopf radiation results. Refraction as well as convective effects in the multiple flow streams is considered. The peak in the radiation pattern, which occurs nearly at engine sideline, is composed of modes with relatively large cut-off ratios. This implies that aft fan radiation will be inherently more difficult to suppress that the fan inlet noise. The theoretical multimodal radiation pattern is compared to experimental data for the first two harmonics of blade passage frequency for three full scale fans at two speeds. The agreement between theory and experiment is quite good. A.R.H.

HYPERBOLIC FITS TO TIME-OF-ARRIVAL SOUND RANGING MEASUREMENTS
Don Hoock and Mike Marotta Dec. 1979 31 p
(Contract DAAD07-79-C-0008; DA Proj. 1L1-62111-AH-71) (AD-A080746; ERADCOM/ASL-CR-79-0008-3) Avail: NTIS HC A03/MF A01 CSCL 17/1

A simple algorithm is presented for fitting a hyperbola to the times of arrival of sounds at each of several microphone locations along a linear array. Timing points, taken in groups of three, are tested for causality to determine that they can be associated with a physically realizable source location. The resulting parameters defining the fit or averaged hyperbola are themselves an initial estimate of source location and sound emission time. After transformation to field coordinates, these estimates are capable of being used as input to existing sound ranging algorithms which correct for wind and temperature. If displayed with raw data, the hyperbola may be used in future to aid personnel in identifying related signals from among background clutter and for initial visual assessment of data quality. The algorithm is expected to be a useful tool in supporting advanced ranging techniques. GRA

BACKSCATTERING PROGRAMS FOR SPHERICAL TARGETS
Richard K. Johnson, Lawrence Flax (NRL, Washington, D. C.), and David Standley Apr. 1979 34 p refs
(Contract N00014-76-C-0067; NR Proj. 038-102)
(AD-A081094; REF-79-7) Avail: NTIS HC A03/MF A01 CSCL 20/1

These programs compute the acoustical reflectivity of a sphere in a fluid medium. The programs differ in the allowed physical properties of the spheres. The principal outputs of the programs are plots of reflectivity, R-squared, as a function of size-frequency, ka. The reflectivity is defined as R-squared = (sigma sub b)/(a-squared/4) where sigma sub b is the backscattering cross-section of the sphere, and a-squared/4 is the backscattering cross-section of a completely reflecting sphere of radius a. The variable k is the wavenumber in the medium. These plots may be considered as dimensionless representations of target strength vs. frequency. The conversions are TS = 10 log (R-squared times a-squared/4) and f = cKa/2pia with a in meters, c in meters per second and f in kHz. This relation for frequency is such that the product of frequency in kHz and radius in mm is 240 when ka = 1. These programs have been used primarily for low contrast cases (with g and h near one) at relatively low values of ka (less than 10). GRA

ANALYSIS OF ULTRASONIC FLOWMETERS FOR LEAK DETECTION IN LIQUID HYDROCARBON PIPELINES
Stacy E. Gehman and Allen B. Holmes Dec. 1979 26 p ref
(AD-A081791; HDL-TR-1907) Avail: NTIS HC A03/MF CSCL 03/11

A program was conducted to determine repeatability and linearity of the ultrasonic time-delay types of flowmeters, so that their applicability to leak detection on underwater pipelines could be assessed. Field tests using merchantable crude oil were conducted on two off-the-shelf, commercially available flowmeters at a refinery meter proving station. These tests showed a short-term repeatability of 0.2 percent for both meters. Long-term (7 hours) repeatability was 0.6 percent for one meter and 2.5 percent for the other. For a leak detection system in which line balance is continually computed and line packing is compensated for, slow drifts in line balance due to drifts of meter factors can be compensated for by periodically adjusting meter factors. For a meter with drift characteristics similar to those measured, a computerized simulation indicates that the probability of detecting a leak greater than 0.6 of the total flow in 10 minutes is greater than 99 percent. The probability of a false alarm for the same conditions is about once per week. GRA

MULTIQUANTUM ULTRAVIOLET EXCITATION OF ATOMS AND MOLECULES Ph.D. Thesis
Jeffrey Bokor 1980 174 p
Avail: Univ. Microfilms Order No. 8011610

Properties of a variety of atoms and molecules prepared in high lying electronically excited states were studied by multiphoton absorption of rare gas halide ultraviolet laser radiation. The basic technique used involved the observation of laser induced fluorescence from gaseous samples irradiated by an argon fluoride (193 nm) or krypton fluoride (248 nm) laser. A specially constructed tunable laser source was used in some of the experiments. Following a review of the theory of multiphoton absorption processes, and the fundamental properties of high power ultraviolet lasers, the experimental results are described. Dissert. Abstr.

N80-24136 Texas Univ. at Austin.
MEASUREMENTS OF THE TOTAL ELASTIC SCATTERING CROSS SECTION FOR ARGON ON ARGON AT COLLISION ENERGIES BELOW FOUR MILLIVOLTS Ph.D. Thesis
Georges Edward Jamieson 1979 75 p
Avail: Univ. Microfilms Order No. 8009878

Total elastic scattering cross sections for argon on argon were measured over the energy range of two to four millivolts. Identical particle symmetry oscillations were clearly resolved, with two maxima and three minima observed. Comparisons were made with computed cross sections. Relative positions of the sharp minima were more accurately determined than absolute positions, with the locations of the maxima and the shapes of the peaks being the less accurately measured quantities. Dissert. Abstr.

SCATTERING OF LOW-ENERGY ELECTRONS BY LASER EXCITED SODIUM ATOMS IN THE 3 2P 3/2 STATE Ph.D. Thesis
Richard Kaoyu Dang 1979 124 p
Avail: Univ. Microfilms Order No. 8010334

The atomic beam double-recoil technique was used to measure total cross sections for the scattering of electrons by sodium atoms. The electron energy ranges from 0.85 to 6 eV. A single mode, tunable dye laser is projected into the interaction region to raise some of the atoms from the ground state to a higher state. The fraction of atoms that are in the excited state was determined by observing the net atomic beam recoil due to resonant photon interaction in the direction of the laser beam. The mixture of the ground and the excited state of the sodium atoms was then cross-fired by a modulated electron beam. Dissert. Abstr.

STUDIES OF LASER SELECTIVE EXCITATION OF ATOMS
Norbert Drewell Dec. 1979 151 p refs
(Grant AF-AFOSR-2902-76)
(UTIAS-229; ISSN-0082-5255) Avail: NTIS HC A08/MF A01

Sample preparation through laser ablation of a solid target under vacuum was combined with short-pulsed laser selective excitation to create a technique for measuring atomic radiative lifetimes. The lifetimes of the three resonance states of chromium compare very favorably with those found through other experimental means. The technique was extended to demonstrate the potential for plasma dianostics using two-wavelength selective excitation with short laser pulses. The ratio of population densities of two energy states of chromium atoms was measured as a function of time during the expansion of the ablation plasma. Extended saturation pumping of the resonance transition in sodium vapor was also investigated. Rate equations for 20 energy levels in the sodium atom, and the rate equations for the free electrons were integrated numerically. It was found that multiphoton ionization, combined with superelastic heating of free electrons can account for the rapid and complete ionization of an un-ionized vapor. The theoretical results led to the development of a simple model which accurately predicts the temporal variation of electron density. A.R.H.

COMPUTERIZED METHOD FOR THE GENERATION OF MOLECULAR TRANSMITTANCE FUNCTIONS IN THE INFRARED REGION Final Report
Joseph H. Pierluissi and Ken Tomiyama 31 Dec. 1979 195 p refs

(Contract DAAG29-79-C-0067)
(AD-A081789; FR1-79-UA-72; ARO-16641.1-GS) Avail: NTIS HC A09/MF A01 CSCL 07/4

A study is made of two basically distinct methods normally used in the development of band models for the calculation of gaseous molecular transmittance in the infrared region. The first method consists of the determination of the 'empirical' transmittance function and the associated absorber and spectral parameters from measured or calculated transmittance spectra. The second method consists of the determination of the absorber and spectral parameters with an assumed 'analytical' transmittance function, using the same type of data. Computerized numerical techniques are presented in connection with the first method and a generalized transmittance function is adopted for the second method. Although the methodology is generally applicable to other gaseous species, it is specifically discussed in connection with the trace gases SO2, NO, NO2, and NH3. As a secondary effort a structural breakdown of the Lowtran code is presented for the purpose of incorporating the band models for the trace gases. GRA

(AD-A081746) Avail: NTIS HC A02/MF A01 CSCL 07/4

New techniques for making time-resolved studies of atoms in highly excited (Rydberg) states will be developed. In particular, the absorption or emission of radiation by Rydberg-state atoms will be monitored on a nanosecond time scale during and after irradiation by various laser pulse sequences. The signals thus produced (known as coherent transient effects), will be studied in order to provide both information about collisional relaxation processes in Rydberg atoms and other spectroscopic data. CROSSED BEAM REACTIVE SCATTERING OF OXYGEN ATOMS AND SURFACE SCATTERING STUDIES OF GASEOUS CONDENSATION Ph.D. Thesis
Steven Jay Sibener Sep. 1979 243 p refs
(Contract W-7405-eng-48)
(LBL-9811) Avail: NTIS HC A11/MF A01

A high pressure, radio frequency discharge nozzle beam source was developed for the production of very intense supersonic beams of oxygen atoms. This source is capable of producing seeded beams of ground state atoms when dilute oxygen-argon mixtures are used, with molecular dissociation levels exceeding 80% being realized for operation at pressures up to 350 torr. When dilute oxygen-helium mixtures are employed, both ground state and excited state atoms are present in the terminal beam, with molecular dissociation levels typically exceeding 60% being achieved for operation at pressures up to 200 torr. Atomic oxygen mean translational energies from 0.14 to 0.50 eV were obtained using the seeded beams technique, with Mach numbers as high as 10 (FWHM delta v/v approximately 20%) being realized. The ICl, CF3I, C6H6, and C6D6 reactions are discussed. A series of beam-surface scattering experiments is also described which examined the internal and translational energy dependence of molecular condensation probabilities for collisions involving either CCl4 or SF6 and their respective condensed phases. (Contract EY-76-S-05-3992)
(ORO-3992-371) Avail: NTI HC A02/MF A01

The cosmic temperature at which primordial quarks condense into baryons is calculated for a number of cases within a field theory of partially confined quarks that enjoys temporary

asymptotic freedom. It is assumed that the mass of a quark in a dense quark antiquark medium is a monotonic function of the medium, that is, that the so-called Archimedes effect is valid. It is shown that, within such models, unbound quark lifetimes are larger than the age of the universe at the time of the transition and that the Archimedes effect implies that the change of the medium from free to bound quarks is a phase transition. HIGH RESOLUTION OPTICAL RANGING SYSTEM Ph.D. Thesis
Heungsup Park 1980 108 p
Avail: Univ. Microfilms Order No. 8011690

Reflection from a viewed object can be detected with a high signal to noise ratio, by sending short pulses into a scattering and absorbing medium, and opening an optical gate only during the time when the light reflected from a specified range returns. By using picosecond pulses and a picosecond optical gate 0.3 mm spatial resolution can be achieved. A pulsed (picosecond) local oscillator for heterodyne detection of the reflected picosecond pulses constitutes the fast optical gate. The pulses from a mode locked dye laser at some optical frequency are incident upon an acoustic wave to provide a frequency shifted wave, by Bragg diffraction. The reference signal at the shifted frequency passes through a variable delay element and goes to the photocathode of a photomultiplier. The direct beam at the original frequency, in passing through an absorbing and scattering medium, is reflected and backscattered continuously. The reflected signal is consequently dispersed in time. Dissert. Abstr.

CONSTANT MAGNIFICATION OPTICAL TRACKING SYSTEM Patent Application
Robert E. Frazer, inventor (to NASA) (JPL) Filed 30 Apr. 1980 14 p
(Contract NAS7-100)
(NASA-Case-NPO-14813-1; US-Patent-Appl-SN-145282) Avail: NTIS HC A02/MF A01 CSCL 20F

A constant magnification optical tracking system is disclosed wherein a traveling objective lens maintains a fixed relationship to an object to be optically tracked. The objective lens is chosen to provide a collimated light beam oriented in the direction of travel of the moving object. A reflective surface is attached to the traveling objective lens for reflecting an image of the moving object to the lens. The moving object is maintained at the focal point of the traveling objective lens. A motor and control means is provided for maintaining the traveling objective lens in a fixed relationship relative to a free falling object, thereby keeping said object at the focal point and centered on the axis of the traveling objective lens throughout its entire free fall path. ANALYSIS OF MULTIMODE FIBER COUPLERS, TAPERS AND MODE CONVERTERS Final Technical Report, 4 Aug. 1978 - 31 Jul. 1979
C. Yeh Griffiss AFB, N.Y. RADC Jan. 1980 115 p refs
(Contract F19628-78-C-0206; AF Proj. 2306)
(AD-A081669; EM-F-01; RADC-TR-79-341) Avail: NTIS HC A06/MF A01 CSCL 20/6

This is a final report on the analysis of multimode fiber couplers, tapers and mode converters. A method based on the fast Fourier transform technique of scalar wave equation has been successfully developed to yield numerical results on a number of practical multimode fiber components. Included in this report are listings of the computer programs. GRA

EVALUATION OF NRL GLASS FOR FIBER OPTICS, PHASE 1 Interim Report, Oct. 1978 - 15 Jun. 1979
14 Sep. 1979 36 p refs
(Contract N00173-78-C-0242)
(AD-A081582) Avail: NTIS HC A03/MF A01 CSCL 11/2

This interim report covers a Phase 1 activity to develop glasses for medium loss fiber optic waveguides. The requirements of the final fiber are that it should have: (1) a diameter of 75 to 125 micrometers with a 50 to 75 micrometers core; (2) a numerical aperture of 0.4 to 0.6; (3) losses of approximately 100 dB/km; and (4) radiation resistance. The Phase 1 activities included the evaluation of a special NRL core glass composition, development of several promising clad glasses and fabricating

a test fiber utilizing one of the clad glasses over the NRL core. Meeting the loss requirement was not an objective in Phase 1. GRA

EFFICIENT ADAPTIVE FIR AND IIR FILTERS Ph.D. Thesis
Uzi Ben-Yakov Dec. 1979 149 p refs
(AD-A081605) Avail: NTIS HC A07/MF A01 CSCL 17/5

Self adaptive filters adjust their parameters to perform an almost optimal filtering operation without a prior knowledge of the input signal statistics. Two approaches to the design of efficient self adaptive discrete filtering algorithms are considered. For non-recursive (FIR) adaptive filters, simplified estimations of the gradient of the performance function to be minimized are considered. These algorithms result in reduced complexity of implementation, improved dynamic operating range with about the same misadjustment errors and convergence time as the classic LMS (Least Means Squared) algorithm. An analysis of the simplified gradient approach is presented and confirmed experimentally for the specific example of an adaptive line enhancer (ALE). The results are used to compare the simplified gradient approaches with each other and the LMS algorithm. This comparison is done using a new graphic presentation of adaptive filter operating characteristics and a complexity index. This comparison indicates that the simplified gradient estimators are superior to the LMS algorithm for filters of equal complexity. GRA

PASSIVE INFRARED SURVEILLANCE. PART 2: THRESHOLD-CROSSING RECEIVERS Interim Report
Richard A. Steinberg 24 Jan. 1980 61 p refs
(ZF32391003)
(AD-A081723; AD-E000373; NRL-8367; EOTPO-57) Avail: NTIS HC A04/MF A01 CSCL 17/5

A number of infrared passive surveillance receivers are analyzed with the theory developed in Part 1 (NRL Report 8320). The specific problem of interest is the detection of low-contrast point-source targets against high-contrast structured backgrounds. A new and promising approach to signal processing is proposed for minimizing background-induced false alarms while retaining maximum target-detection sensitivity. It is shown that improvements in focal-plane-array (FPA) technology employing time delay and integration (TDI) may afford 'excess' detector sensitivity that can be intentionally sacrificed in the interest of enhanced performance against structured scenes. EFFECTS OF IMPURITY RADIATION ON REVERSED-FIELD PINCH EVOLUTION Ph.D. Thesis
Edward James Caramana 1979 145 p
Avail: Univ. Microfilms Order No. 8011266

A one dimensional MHD simulation code that includes both plasma transport and impurity effects and follows the plasma through a series of equilibrium states was used. The equations are split into two sets, one that contains plasma transport and another that contains atomic physics effects. Two codes were developed and linked together to solve the full problem. Results are presented for the ZT-S, ZT-40, and RFX experiments with a fixed set of parameters, typical or envisioned, and various concentrations of impurities. Radiation barriers are encountered and limits are found on the acceptable level of low Z impurities that may be present in these devices. A criterion for radiation barrier burn-through is derived in terms of appropriate nondimensional parameters and calibrated by comparison to the numerical simulations for the case of oxygen. Thermal instability in the reversed-field pinch is explored. For the case of a reversed-field pinch in a nearly force-free equilibrium, after the formation phase, as the plasma attempts to ohmically heat to a significant beta.

ELIMINATION OF DEFECTS IN PLASMA POLYMERIZED FILMS USED IN LASER FUSION TARGETS
S. A. Letts, W. L. Johnson, D. W. Myers, J. D. Illige, L. E. Lorenson, and C. W. Hatcher 11 Apr. 1979 10 p refs
(Contract W-7405-eng-48)
(UCID-18324) Avail: NTIS HC A02/MF A01

The identification and control of the parameters which govern the formation of defects in plasma polymerized surfaces are discussed. The process variables (power dissipated in the discharge, pressure and rate of monomer flow) which control the nature of the plasma were studied using an inductively coupled discharge. Preexisting irregularities on the polymerized surfaces were examined using flourocarbon coated glass slides. The relationship between the size of a substrate irregularity and the defect it generates is discussed and the effect of the substrate irregularities upon the coating smoothness is described. A.R.H.

A HIGH POWER INDUCTIVELY COUPLED PLASMA TORCH AND IMPEDANCE MATCHING NETWORK Interim Report
D. L. Windsor, D. R. Heine, and M. B. Denton 13 Apr. 1979 15 p refs
(Contract N00014-75-C-0513; NR Proj. 051-549)
(AD-A080906; TR-22) Avail: NTIS HC A02/MF A01 CSCL 20/9

The relative ease of operation, power handling capabilities and overall performance of an inductively coupled- plasma-optical emission spectrometer (ICP-OES) depends upon numerous factors, not the least important of which is the design of the torch. A variety of such designs has appeared in the literature. Most workers have employed three concentric fused silica and/or pyrex tubes, referred to as an inner sample gas tube, a 'flaired mouth' plasma gas tube, and an outer coolant tube. These tubes are either fused into one or two-piece units through glass blowing techniques or mounted in some type of dismantleable base assembly. Precise alignment of the glass-blown torch can be achieved during construction through the use of an assembly jig. However, this type of torch is not easily repaired should problems be encountered. The dismantleable base approach can be difficult to align if the three tubes are held only near the bottom. This problem is aggravated by the fact that rarely is commercial quartz and pyrex glass tubing perfectly straight or cylindrical. A torch design which is both dismantleable and self-aligning has been successfully used in this laboratory for several years. A unique feature is the use of nylon or teflon slip fit spacers between the sample and plasma gas tubes and the plasma and coolant gas tubes. GRA

PLASMA BOUNDARY COLLISIONLESS ABSORPTION EFFECTS IN THE LOADING OF RF CONDUCTORS
G. J. Morales Oct. 1979 28 p refs
(Contract N00014-75-C-0476)
(AD-A081115; PPG-435) Avail: NTIS HC A03/MF A01 CSCL 20/9

This study considers the role of collisionless absorption at the boundary between an unmagnetized plasma and a conductor to which an RF potential is applied. The Landau half-space problem is examined from the energetic viewpoint to calculate the surface power absorption due to longitudinal fields. The transverse field absorption is evaluated and the connection with the anomalous skin effect is indicated. The corresponding loading resistance is found to be significant for typical surface plasma parameters. A numerical study of pure bounce absorption heating demonstrates the physical reality of the process and uncovers the existence of a time asymptotic equilibrium between the kinetic energy of the plasma and the externally applied RF potential, independent of initial conditions or parameters. GRA

ERGODIC ORBITS IN PARTICLE SIMULATIONS OF STRONG ION RINGS
Alex Friedman 28 Jun. 1979 43 p refs
(Contract DE-AS03-76SF-00034)
(AD-A081391; UCB/ERL-M79/41) Avail: NTIS HC A03/MF A01 CSCL 20/9

The existence of ergodic orbits in magnetostatic simulations of strong ion rings is demonstrated. For nonlinear 2 D3 V simulations with axisymmetry the principal manifestation of such orbits is an eventual violation of left-right mirror symmetry in cases where such symmetry would normally be expected, due to the exponential divergence of neighboring mirror image trajectories. Linearized simulations, in effect, compute the first order separation of orbits which are displaced from each other by an infinitesimal vector for all time. When a linearized code is applied to a problem involving ergodic orbits, the single-particle growth can be faster than that associated with the collective modes of interest, rendering the simulation invalid. This may severely limit the class of problems for which linearized simulation is applicable. Similar effects are expected in simulations of other systems, including field-reversed mirror equilibria with large nominal gyroradii. GRA

FABRICATION AND CHARACTERIZATION OF CRYOGENIC TARGETS FOR INERTIAL CONFINEMENT FUSION
H. Rieger and Kyekyoon Kim Aug. 1979 63 p refs Prepared for California Univ., Lawrence Livermore Lab.
(Contract W-7405-eng-48)
(UCRL-15113) Avail: NTIS HC A04/MF A01

A technique was developed which is capable of fabricating uniform cryogenic targets for use in inertial confinement fusion. The essence of the technique is to directly wet a target with a cold helium gas jet, which results in freezing of the DT mixture contained in the target. A controlled amount of current is pulsed through a heater wire surrounding the target, giving rise to fast evaporation and refreezing of the DT condensate into a uniform layer. Experiments, which were performed with D2 filled glass microshells are described. A set of data illustrating the technique is presented and analyzed. DOE

REMARKS ON THE USE OF DEPOSITION PROBES FOR ANALYSIS OF TOKAMAK BOUNDARY-LAYER PLASMAS
H. Vernickel (Max-Planck-Institut fur Plasmaphysik, Munich, West Germany) Oct. 1979 30 p refs
(Contract W-7405-eng-26)
(ORNL/TM-7034) Avail: NTIS HC A03/MF A01

The deposition of impurities and plasma ions on probes exposed in plasma devices, is discussed as a diagnostic method for characterizing boundary layer plasmas. Quantitative measurements of impurity and plasma particle profiles obtained from ion scattering and nuclear reaction analysis of samples exposed in the plasma edge are described. An analytic model of the boundary layer plasma is utilized to explore the relationship between the deposition profile on such probes and the particle confinement time and ionization probability of wall originated impurities in the boundary layer. ANTIC: A CODE FOR CALCULATION OF NEUTRAL TRANSPORT IN CYLINDRICAL PLASMAS
S. Tamor Dec. 1979 40 p refs
(Contracts EY-76-C-03-1018; DE-AC03-79ET-53057)
(SAI-79-1056-LJ; LAPS-50) Avail: NTIS HC A03/MF A01

A scheme for computing the steady state transport of neutral atoms in cylindrical plasmas is described. The physical model used represents atoms emerging from charge exchange collisions by an isotropic source of neutrals with energy equal to 3/2 times the local ion temperature. The processes of charge exchange and impact ionization by electrons andions are included. The transport can be described by an integral equation for the charge exchange collision density, and this equation approximated by a set of algebraic equations for the zone average collision densities. A derivation of the appropriate kernel and a technique for computing it are presented. Comparisonof computed results with predictions of other, more exact, codes exhibit quite satisfactory agreement for temperatures as high as 10 keV DOE

LASER ANNEALING: SURFACE EPITAXIAL CRYSTALLIZATION, SPATIAL VARIATIONS MEASUREMENT, DYNAMICS OF ANNEALING AND OTHER APPLICATIONS Ph.D. Thesis
Lakkur Parthasarathy 1979 152 p
Avail: Univ. Microfilms Order No. 8011077

Annealing and recrystalization of implanted or amorphous layers of semiconductor material through the rapid heating produced by the absorption of laser light is considered. An electrical circuit equivalent to the physical model is described to simulate the laser annealing process. The nonlinear heat equation is numerically solved to give the time evolution of temperature and melting as a function of pulse energy and its duration. The structure, temperature, and frequency dependence of the absorption coefficient and thermal conductivities are taken into consideration. Phase changes involved are explicitly considered. The model is used for explaining recrystalization as well as depths and thresholds for annealing. The results are in good agreement with the experimental data. The model can be used to account for processes that occur both below and after melting, enables the study of special annealing techniques like frequency mixing, pulsing the beam, and assess the spatial variations in annealing. ELECTRONIC STRUCTURE OF SEMICONDUCTING SURFACE INVERSION LAYERS Ph.D. Thesis
Sankar DasSarma 1979 98 p
Avail: Univ. Microfilms Order No. 8006990

The electronic subband structure of semiconducting surface inversion layers is studied using the Green's function approach and many body perturbation theory. Hartree variational functions are used as the basis states in the theory. At finite temperature self energies and quasi-particle energies of low lying subbands are calculated for various inversion layer concentrations. A finite temperature plasmon-pole approximation is employed to evaluate the self-energies in the first order screened interaction. At low concentrations, the magnitudes of self-energies are found to decrease with temperature for all the subbands. However, at high concentrations, the magnitudes of self-energies of the excited subbands increase with temperature, while that of the ground subband continues to decrease. The subband separations including exchange-correlation effects are found to be much less temperature dependent than the Hartree values. Results are also presented for the effect of a uniaxial stress on the self-energies, quasi-particle energies, energy separations and occupancies in different subbands. Dissert. Abstr.

(AD-A078320; QTR-8) Avail: NTIS HC A02/MF A01 CSCL 20/12

The study of the influence of different parameters on the growth of InP using the hydride growth technique has been continued. This work is to be presented at the 156th Electrochemical Society Meeting, Los Angeles, 1979, and an abstract is included with the reprints/preprints at the end of this report. Because of moisture damage and contamination sustained during a flood this summer, it was decided to implement the new automatic gas flow control system described in the last report as soon as possible. The old system has been disassembled and heliarc welding on the new system is progressing rapidly. Included at the end of this report are some reprints of papers that have been received since the last report and some preprints and abstracts of more recent work. GRA

IMPROVEMENT IN GaAs DEVICE YIELD AND PERFORMANCE THROUGH SUBSTRATE DEFECT GETTERING Interim Technical Report
T. J. Magee, J. Peng, J. Hong, and R. A. Armistead Jan. 1980 43 p refs
(Contract N00014-78-C-0065; ARPA Order 3516)
(AD-A081344; ARACOR-TR-19-2) Avail: NTIS HC A03/MF A01 CSCL 07/2

The gettering of Cr and front-surfaces defects by mechanically produced back-surface damage in semi-insulating GaAs wafers has been investigated. It has been shown that improved VPE layers can be grown on pre-gettered substrates. Also, the level of Cr outdiffusing from the substrate during epilayer growth and subsequent annealing is substantially reduced when pre-gettered substrates are used. Thermal stability times of back-surface damage at an anneal temperature of 800 C is typically on the order of 2 - 3 hours, corresponding to the point at which major back-surface microstructural damage is largely annealed. Increases in the thermal stability period were attained by encapsulating the back surface with an As-doped SiO2 layer. Subsequent investigations of Au contacts on GaAs showed that Cr was mobile during 350 C alloying, resulting in gettering within alloy damage regions and subsequent outdiffusion into the Au film. Device structures (FET) fabricated on VPE layers on pre-gettered GaAs wafers showed considerable improvements in both yield/wafer, noise figures at higher frequencies and input capacitance values. PIEZOELECTRICITY IN POLYACRYLONITRILE Interim Report
H. Ueda and S. H. Carr 4 Jan. 1980 30 p refs Submitted for publication
(Contract N00014-75-C-0963; Grant NSF DMR-76-80847; NR Proj. 051-599)
(AD-A081250; TR-8) Avail: NTIS HC A03/MF A01 CSCL 11/9

The piezoelectricity and related properties in ion-doped (NH4NO3, NaNO3) and undoped films of polyacrylonitrile have been measured as a function of temperature. The piezoelectric constants of both ion-doped and undoped films show a maximum around 80 C and thereafter decrease markedly with temperature. A maximum of thermally stimulated discharge current (TSDC) around 90 C is observed in both ion-doped and undoped films. An abrupt decrease of piezoelectric constant around 90 C and TSDC maximum around 90 C are ascribed to randomization of nitrile dipoles in ordered regions. The piezoelectric constant of stretched films has a tendency to increase with stretching. The piezoelectric constant, d sub 31, changes from positive to negative when temperature rises above 110 C. GRA

LIQUID PHASE EPITAXIAL GROWTH OF GALLIUM ARSENIDE
M. Folkard Aug. 1979 42 p refs
(AD-A081835; ERL-0078-TR) Avail: NTIS HC A03/MF A01 CSCL 20/12

This report discusses two methods of liquid phase epitaxial (LPE) growth applied to the compound semi-conductor gallium arsenide, and develops a mathematical description for each using a diffusion-limited model. The properties of the epitaxial layers grown under various experimental conditions are discussed, and the observed growth rates compared with those predicted by the mathematical models. From the differences observed, it is concluded that processes additional to simple diffusion of solute through the melt are occurring. Convective mixing caused by horizontal temperature gradients within the melt is suggested as an explanation for these differences. GRA

STUDIES IN THE THEORY OF SOLIDS Ph.D. Thesis
H. P. Hjalmarson 1979 263 p refs
(Contract EY-76-C-02-1198)
(COO-1198-1283) Avail: NTIS HC A12/MF A01

The surface sandwich reflectivity, computed by using a method which considers only single reflections of the electron by sheets of atoms in the solid, was directly compared with the slowly varying, surface dependent features in the data. The method was used to determine that the surface of TiS2 is ideal whereas the surface sandwich of TiSe2 expands outward slightly. For the final determinations, the smoothing method was used on both the data and a theory which includes multiple scattering to confine the comparison to just the slowly varying surface dependent features. Energies of deep traps associated with impurities in semiconductors are shown to be controlled by the S and P orbital energies of the impurity atoms. Predictions of energies of deep traps caused by impurities are made for fourteen different semiconductors. The theory is compared with the data for GaP and the alloy GaAs(1-x)Px. A phenomenological model which depends mainly on the energy centers of the valence and conduction band density of states as well as atomic energies of impurities is used to make predictions of deep trap energies in Si. VORTICES IN SUPERCONDUCTING FILMS
John R. Clem 1979 7 p refs Presented at the Inhomogeneous Superconductors Conf., Berkeley Springs, W. Va., 1 Nov. 1979
(Contract W-7405-eng-82)
(ISM-258; CONF-791151-1) Avail: NTIS HC A02/MF A01

The local magnetic flux density and electrical current density generated by a vortex in a superconducting film is calculated approximately using an extension of Pearl's method. The results apply to arbitrary ratios of the film thickness to the penetration depth and reduce to Pearl's thin-film and semi-infinite results in the appropriate limits. In addition, the vanishing of the order parameter on the vortex axis is accounted for by a simple model which removes the London-model divergences of the flux density and supercurrent density and leads to a physically correct description in the vortex core. The results are then applied to a calculation of the interaction energy of vortex-vortex and vortex-antivortex pairs. DOE

MODEL OF THE RECRYSTALLIZATION MECHANISM OF AMORPHOUS SILICON LAYERS CREATED BY ION IMPLANTATION Ph.D. Thesis
Robert M. Drosd Nov. 1979 96 p refs
(Contract W-7405-eng-48)
(LBL-9990) Avail: NTIS HC A05/MF A01

The recrystallization behavior during annealing of thin films

of amorphous silicon, in contact with a single crystal silicon substrate (referred to as C), was studied in the transmission electron microscope (TEM). The amorphous film is created during high dose phosphorus ion implantation at 100 keV. It was found that the crystal substrate orientation and the implantation temperature have dramatic effects on the recrystallization rate, and the defect microstructure produced during annealing. Specifically, (100) wafers implanted at 77 K contain only a low density of dislocation loops, but when the same wafer is implanted at room temperature the dislocation density is increased drastically. When implanted at 77 K (111) wafers show a high density of microtwins, but as the implantation temperature is increased a gradual increase in the density of dislocation loops is observed along with a reduction of the microtwins. At an implantation temperature of about 100 C both orientations give an identical defect microstructure when annealed, which is a dense tangle of dislocations. DOE

THIN FILM ANNEALING BY ION BOMBARDMENT
E. H. Hirsch and I. K. Varga Aug. 1979 18 p refs
(PB80-125677; ERL-0092-TR; AR-001-701) Avail: NTIS HC A02/MF A01 CSCL 20L

The enhancement of film adherence resulting from argon ion bombardment during the evaporation procedure was studied experimentally. The observations point to the existence of an annealing effect caused by atomic rearrangement in bombardment induced temperature spikes. This mechanism begins to be effective at a critical minimum bombardment intensity, which is sufficient to ensure that practically all the deposited material is subjected to rearrangement soon after it has condensed. The small amount of argon incorporated into the film by the bombardment is shown to have no significant influence on the process. GRA

ON VACUUM FLUCTUATIONS OF A SCALAR FIELD IN A LOCALIZED REGION OF SPACETIME Ph.D. Thesis
Richard T. Hammond 1979 88 p
Avail: Univ. Microfilms Order No. 8011504

It is shown that the wavenumber of a scalar field is reduced due to curvature of space. This effect is shown to occur in an Einstein metric, de Sitter space, and the Schwarzchild geometry. Furthermore, it is shown that this effect is more pronounced for higher frequencies and larger curvature. A particle the mass (energy), was modeled by the vacuum energy of a quantized scalar field. The vacuum expectation value of the time-time component of the energy momentum tensor of the scalar field is used in the Einstein field equations. It is then shown that the zero-point energy is not infinite as it appears in flat space but, due to the natural gravitational cutoff, is actually finite. The resulting particle has a mass to radius ratio of that of a black hole. The model is extended by considering a charged particle. If the charge is assumed to be one electronic charage then the resulting particle is a black hole the radius of which is one Planck length and the mass is equal to the Planck mass. Dissert. Abstr.

MATRIX MANAGEMENT FOR AEROSPACE 2000
John F. McCarthy, Jr. May 1980 16 p refs Presented at the Intern. Meeting and Techn. Display: Global Technol. 2000, Baltimore, 5-11 May 1980
(NASA-TM-81509; E-447) Avail: NTIS HC A02/MF A01 CSCL 05A

The matrix management approach to program management is an organized effort for attaining program objectives by defining and structuring all elements so as to form a single system whose parts are united by interaction. The objective of the systems approach is uncompromisingly complete coverage of the program management endeavor. Starting with an analysis of the functions necessary to carry out a given program, a model must be defined; a matrix of responsibility assignment must be prepared; and each operational process must be examined to establish how it is to be carried out and how it relates to all other processes. A MANAGEMENT PERSPECTIVE ON THE ROLE OF INFORMATION PRODUCTION IN THE ORGANIZATION M.S. Thesis
Richard L. Wooten Sep. 1979 53 p refs
(AD-A081058) Avail: NTIS HC A04/MF A01 CSCL 05/1

The explosive growth of information technology in the last decade has caused a demand for experienced information system managers far beyond the present supply. Consequently, many of these positions are filled by personnel who may lack a comprehensive understanding of the role of information production in the organization. This paper addresses organization processes and interactions of which the information system manager must be made aware in order to perform his job effectively. Discussion includes organization purpose, structure, decision processes, and information production. When appropriate, descriptive models were developed in order to better understand the synergistic relationships which exist. Particular attention was given to the need for systematic valuation of organization information products, and development of the 'product-worth function' is proposed as a possible approach to this problem. A COMPUTER SIMULATION OF ORGANIZATIONAL DECISION-MAKING M.S. Thesis
Vincent John Andrews Dec. 1979 85 p refs
(AD-A081600) Avail: NTIS HC A05/MF A01 CSCL 09/2

A computer simulation of organizational decision-making is developed based on the Complete Cycle of Choice. The interrelationships between attitudes, individual behaviors, organization choices, and the environment are represented in terms of matrices and mathematical equations. Statistical analysis of the data generated by the simulation program is performed to discern

significant variables and decision-making patterns. Refinements to the basic model are proposed to increase its usefulness as a managerial tool. GRA

(AD-A080800; DTIC-TR-80/1; DDC/TR-78/3) Avail: NTIS HC A05/MF A01 CSCL 05/2

Defense Technical Information Center (DTIC) rules for cataloging of reports for computer entry are arranged in numeric order by the number designations of the computer fields described. Data regarding space limitations for each field are provided. Additional fields have been added to previous edition to include regrading of classified reports to implement EO 12065 effective 1 December 1978. These rules are an adaptation of Guidelines for Descriptive Cataloging of Reports, A Revision of COSATI Standard for Descriptive Cataloging of Government Scientific and Technical Reports, published in March 1978 as AD-A050900. Subject fields and groups, abstracts, posting terms and candidate posting terms are discussed briefly. Included is an appendix from COSATI of personal author surnames with separately written prefixes, as well as several appendices designed for use by trainee catalogers. GRA

OBSERVATIONS AND ANALYSIS OF FOUR ECLIPSING BINARY SYSTEMS Ph.D. Thesis
William Clarence Maddox 1979 123 p
Avail: Univ. Microfilms Order No. 8010560

Four eclipsing binary systems were observed in order to determine times of minimum light and conduct period studies. Three of these, in the constellation Ophiuchus, are W Ursae Majoris-type eclipsing binaries. The fourth, R W Tauri, is an Algol-type system. V502 Oph was analyzed using the Russell-Merrill and Wilson-Devinney methods. R W Tauri was analyzed using the Wilson-Devinney method. Dissert. Abstr.

VACUUM BLACK HOLE GRAVITATIONAL WAVE CROSS SECTIONS Ph.D. Thesis
Francis Albert Handler 1979 145 p
Avail: Univ. Microfilms Order No. 8009864

The problem of scattering of plane gravitational waves incident along the z axis of a Kerr black hole was solved numerically. Analogies between the problem and several simplified problems are exploited to provide intuitive understanding of the features seen in the scattering cross sections. Partial wave absorption as a function of lambda provided a measure of marginally trapped null trajectories characterized by an asymptotic impact parameter. The parameter was found to be larger for the case of corotation between the incoming wave and hole than for the counter rotating case. Interpretation of the differential cross section was further achieved using a semiclassical viewpoint borrowed from quantum scattering. Dissert. Abstr.

N80-24221 Colorado Univ. at Boulder.
THE SHELL EPISODE OF 59 CYGNI (1974-1975): ROTATING MAGNETIC WINDS? Ph.D. Thesis
Paul Kenneth Barker 1979 236 p
Avail: Univ. Microfilms Order No. 8011263

High quality spectroscopic observation obtained of the early Be star 59 Cygni during an active phase characterized by mass ejection and a 160-day shell episode are examined. Shell absorption lines are shown to display variations in strength and velocity which have a form radically different from the variations seen in Pleione. The nonlinear hydrodynamic equations governing a radiatively driven rotating magnetic stellar wind are solved numerically. An extensive grid of quasi-static subcritical model winds is calculated for both a hard force law and a new semi-soft force law, for a variety of mass loss rates and magnetic field strengths, with and without rotation. The terminal velocities of both hard and semi-soft winds are sensitive to changes in the wind parameters. Semi-soft winds are more sensitive than hard winds: such a wind from a rapidly rotating star with a photospheric field of 20 gauss can have a terminal velocity a factor of four lower that the wind from an identical nonrotating nonmagnetic star. Variability in either the mass loss rate or the magnetic field can explain the large wind velocity changes observed in 59 Cygni. Dissert. Abstr.

GROUND-BASED MEASUREMENTS OF SOURCES IN THE AFGL INFRARED SKY SURVEY Final Report, 1 Aug. 1976 - 15 Nov. 1979
Richard J. Rudy, Timothy R. Gosnell, and S. P. Willner 15 Nov. 1979 73 p refs
(Contract F19628-76-C-0252; AF Proj. 7670)
(AD-A081381; AFGL-TR-79-0172) Avail: NTIS HC A04/MF A01 CSCL 03/1

This report contains ground-based observations of 271 objects detected in the AFGL infrared sky survey, falling between 40 min. and 60 min. of each hour of right ascension and -60 deg and -30 deg of declination. Photometric magnitudes are presented for those sources which could be located from the ground and are compared to those reported by the Air Force. Conclusions are drawn concerning the identification of AFGL sources with IRC sources. A rough classification is made of the catalogue objects within our area of the sky. Limits for completeness of the survey are approximately -1.0 mag at 4 micrometers and -1.0 mag at 11 micrometers. GRA

PULSATION OF HIGH LUMINOSITY HELIUM STARS
D. S. King, J. C. Wheeler (NBS, Boulder, Colo.), J. P. Cox (NBS, Boulder, Colo.), A. N. Cox, and S. W. Hodson 1979 12 p refs Presented at the Nonradial and Nonlinear Stellar Pulsation Workshop, Tucson, Ariz., 12 Mar. 1979 Submitted for publication
(Contract W-7405-eng-36)
(LA-UR-79-2785; CONF-790364-4) Avail: NTIS HC A02/MF A01

Preliminary calculations are made on a systematic restudy of the linear and nonlinear pulsations of helium stars allowing for more recent and higher estimates of the effective temperature and for the high carbon abundance. Linear and nonlinear models are used. Results show qualitative agreement with earlier ones, models with sufficiently large L/M have a very hot blue edge for their instability strip, very large L/M values lead to dynamically unstable models which would appear to eject mass and therefore may not be realistic models for the pulsating RCrB stars, for the sequence studied a reasonable mass could be > or = 1.5 M sub solar. THEORETICAL INVESTIGATION OF STATIONARY STELLAR SYSTEMS IN THE BRANS-DICKE THEORY OF GRAVITATION, WITH APPLICATIONS TO PERFECT FLUID INTERIORS Ph.D. Thesis
William Fred Bruckman 1979 276 p
Avail: Univ. Microfilms Order No. 8008083

Stationary stars in the Brans-Dicke-Jordan theory of gravitation were modeled and studied. Cold, superdense, perfect fluid configurations were investigated and exact and approximate solutions were found which suggest that there is a maximum mass for cold matter beyond which equilibrium cannot be achieved. Methods for generating Brans-Dicke-Jordan solutions from known solutions of general relativistic perfect fluids and from Einstein-Maxwell equations, are presented. The stability of equilibrium configurations was studied using a critical based on energy considerations alone and the case of radial perturbations of spherically symmetric perfect fluids in general relativity is discussed. Dissert. Abstr.

N80-24226 Ohio State Univ., Columbus.
EVOLUTION OF A SUPERMASSIVE OBJECT ACCRETING MASS Ph.D. Thesis
Robert Charles Reynolds 1979 289 p
Avail: Univ. Microfilms Order No. 8009333

The evolution of a supermassive star accreting mass is studied. The range of masses considered is 100,000 to 1,000,000 M with an accretion rate of 10 to the 27th power gm/sec and an infall velocity for the accreting material of 100,000,000 cm/sec. The dynamical behavior of nonvacuum and vacuum models were analyzed in three short time step sequences. Dissert. Abstr.

N80-24227 State Univ. of New York at Stony Brook.
HELIUM ABUNDANCES IN YOUNG CLUSTERS AND ASSOCIATIONS Ph.D. Thesis
Gail Yanchak Patton 1979 179 p
Avail: Univ. Microfilms Order No. 8011072

Helium abundances derived from high dispersion spectrograms of 80 early B stars are discussed. These objects are members of seven young clusters and two associations which span a range of galactocentric radius of nearly four kiloparsecs. It is assumed that each cluster is characterized by a unique helium abundance which reflects that of the interstellar medium from which the cluster condensed. An estimate of this abundance can be obtained from the mean of the helium abundance determined from the individual B stars in a cluster. Comparison of the cluster means shows a range in abundances of 086 < or = N(He) < or = .107. However, the inclusion of undetected spectroscopic binaries may have a substantial effect on the cluster mean helium abundance. A method of indentifying suspected systems in the observed clusters is proposed. A strong upper limit is placed on a possible helium abundance gradient in the Galaxy indicating a mean abundance of N(He) = 097 + or - .002 for B stars. Assuming helium enhancement by nuclear processing of an amount similar to the observed metal enhancement in Population I objects yields Y sub P = .24, within the predicted range of Big Bang cosmology. Dissert. Abstr.

N80-24228 Texas Univ. at Austin.
RAPID OSCILLATIONS IN CATACLYSMIC VARIABLES Ph.D. Thesis
Joseph Otis Patterson 1979 239 p
Avail: Univ. Microfilms Order No. 8009910

The rapid oscillations seen in the optical light curves of cataclysmic variables are examined. The discovery of a class of rapid periodic variable is noted of which DQ Herculis is the prototype. There are four members of this class: two classical novae, one nova-like variable, and one dwarf nova. Their periods range from 28 to 71 seconds, and their oscillations are essentially permanent features of the light curves. The oscillations are extraordinarily stable in period and phase, showing measurable changes only on time scales of years. A comprehensive study of the coherent oscillations seen in the eruption light curves of dwarf novae is also presented. The oscillations are typically seen for a few days near the peak of each dwarf nova eruption. The periods are in the range 8 to 39 seconds, with each star showing a characteristic, and much smaller, range of variation. Finally, a unified model is proposed in which both the DQ Her-type and the dwarf nova oscillations can be produced by the same basic mechanism in rapidly rotating white dwarfs with magnetic fields of 10 to the 5th to 10 to the 8th power gauss, and with time varying accretion rates. Dissert. Abstr.

STUDIES ON GRAVITATIONAL WAVES AND STARS WITH NEUTRON CORES Ph.D. Thesis
Mark Edward Zimmerman 1980 180 p
Avail: Univ. Microfilms Order No. 8010968

Estimates of the astrophysically likely amplitude of gravitational radiation emitted by the Crab and Vela pulsars are presented. The pulsars are modeled as rapidly rotating, freely precessing, rigid or elastic solid bodies. The gravitational radiation produced by an idealized rotating and freely precessing rigid body were studied in the weak field, slow motion, small stresses, quadrupole moment formalism. A natural coordinate system which might be set up by a rotating and accelerating observer is presented and the results in studying nucleosynthesis in stars with neutron star cores are discussed. Dissert. Abstr.

N80-24230 Harvard Univ., Cambridge, Mass.
CHARGE TRANSFER PROCESSES IN ASTROPHYSICAL PLASMAS Ph.D. Thesis
Scott Edward Butler 1979 180 p
Avail: Univ. Microfilms Order No. 8011105

Charge transfer recombination and ionization processes which occur in astrophysical plasmas are investigated. The electronic structure and the couplings which describe the reactions quantum mechanically are studied via the methods of quantum chemistry. Calculations are presented for most astrophysically important charge transfer processes. The significance of each of the couplings which can induce charge transfer is discussed. Rate coefficients calculated by a variety of means are presented, and simple methods based upon the full quantal results are developed to allow the estimation of other rate coefficients. The significance of the process for a wide variety of astronomical objects is pointed out, and the specific effects of charge transfer upon the determination of the neon abundance in planetary nebulae, astrophysical shocks, and the interpretation of the spectral lines of silicon ions are discussed. Dissert. Abstr.

ANALYSIS OF LUNAR SEISMIC SIGNALS: DETERMINATION OF INSTRUMENTAL PARAMETERS AND SEISMIC

VELOCITY DISTRIBUTION Ph.D. Thesis
Peter Horvath 1979 346 p
Avail: Univ. Microfilms Order No. 8010640

Inverse filters, designed to correct for the instrumental response and for near surface effects to facilitate the comparison of the ground motion at the various sites on the lunar surface are described. The constants of the long period lunar seismographs were determined from a least squares inversion of the observed calibration pulses. The noise, especially the digitizing noise, was reduced by using two postive and two negative calibration pulses. The seismograph parameters allowed calculation of the transfer functions for each seismograph and accurate correction of the seismograms for the instrumental response. The seismograms were corrected for both instrumental response and near surface effect and were found to be comparable at the various sites and were used to obtain readings for the direct shear and secondary wave arrivals. Dissert. Abstr.

STUDIES OF IMPACT CRATERING PROCESSES Ph.D. Thesis
Mark Frederick Patrick Settle 1979 189 p
Avail: Univ. Microfilms Order No. 8007061

Impact cratering processes on the Moon and the terrestrial planets are examined. The effects of various modification processes that occur during the terminal stages of an impact cratering event are assessed. The distribution characteristics and mode of emplacement of impact crater ejecta are discussed. Dissert. Abstr.

N80-24234 Brown Univ., Providence, R. I.
EVOLUTION OF THE EARLY LUNAR CRUST: THE ROLE OF IMPACT MELTING, SECONDARY CRATERING, AND HIGHLAND VOLCANISM Ph.D. Thesis
Bernard Ray Hawke 1979 108 p
Avail: Univ. Microfilms Order No. 8007017

The processes associated with impact melting, secondary cratering and highland volcanism are examined and their implications for the evolution of the early lunar crust are discussed. Investigations of lunar impact melt deposits have yielded results concerning melt distribution and modes of occurence as well as the processes responsible for melt emplacement. Criteria for the identification of melt deposits were formulated and an origin as the product of shock melting was confirmed. The modes of occurence, distribution, and amounts of melt were analyzed and found to vary as a function of crater size. A model for the emplacement of large amounts of impact melt on crater rims, which places emphasis on events occuring during the modification stage of the cratering process is presented. Dissert. Abstr.

Sm-Nd AND Rb-Sr CHRONOLOGY OF CRUSTAL FORMATION. PART 1: Ba, Nd AND Sm ISOTOPIC ANOMALIES IN THE ALLENDE METEORITE, PART 2 Ph.D. Thesis
Malcolm Thomas McCulloch 1980 400 p
Avail: Univ. Microfilms Order No. 8010964

The times at which new segments of crust were formed ascertained by using Sm-Nd and Rb-Sr isotopic systematics, together with plausible assumptions regarding the geochemical evolution of the crust and mantle. The general approach used is to assume that the differentiation process which produce magmatic rocks occur with a marked chemical fractionation of the Sm/Nd and Rb/Sr ratios relative to the source region. It is then the time of this chemical fraction which has been dated. This approach is valid insofar as the dominant contribution to the crust comes from emplacement of magmatic rocks derived from a 'uniform' mantle reservoir. Isotopic anomalies are reported for Ba, Nd, and Sm in two inclusions from the Allende meteorite. These inclusions are typical Ca-Alrich objects associated with early condensates from the solar nebula but have distinctive O and Mg isotopic anomalies of FUN type. Dissert. Abstr.

INTERNAL GRAVITY WAVES IN THE SOLAR ATMOSPHERE Ph.D. Thesis
Barbara Ruth Mihalas 1979 322 p
Avail: Univ. Microfilms Order No. 8011292

Three aspects of the behavior of gravity waves in the solar atmosphere are considered adiabatic propagation in the photosphere and chromosphere; photospheric radiative damping of waves generated by convection; and the effects of waves on spectral line profiles. The wave propagation studies are carried out with linearized fluid equations in a standard solar model. The fluid equations are reduced to a single Schroedinger-type equation in the vertical velocity, which is solved as a two-point boundary-value problem. Wave perturbations derived from this solution are used in a line transfer code to study effects of waves with varying parameters on spectra line profiles. Dissert. Abstr.

N80-24239 Colorado Univ. at Boulder.
THE EFFECT OF TRANSPORT PHENOMENA ON ELECTRON VELOCITY DISTRIBUTION FUNCTIONS AND ION ABUNDANCES IN THE SOLAR CHROMOSPHERE-CORONA TRANSITION REGION Ph.D. Thesis
Robert Antoine Roussel-Dupre 1979 293 p
Avail: Univ. Microfilms Order No. 8011301

The effect of non Maxwellian electron distribution functions on ionization equilibrium calculations for ions found in the solar atmosphere and the effects of diffusion on ion abundances in the chromosphere-corona transition region were studied. The electron distribution functions were estimated as a function of height for Dupree's model of the transition region. The results were used to compute ionization rates for ions of carbon nitrogen and oxygen. The effect of thermal diffusion on ion abundances in the solar transition region is discussed. Diffusion coefficients for ions of helium, carbon, nitrogen and oxygen were computed. Dissert. Abstr.

APPLICATION OF ADVANCED COMPUTATIONAL PROCEDURES FOR MODELING SOLAR-WIND INTERACTIONS WITH VENUS: THEORY AND COMPUTER CODE Progress Report, Jul. 1978 - Sep. 1979
Stephen S. Stahara, Daniel Klenke, Barbara C. Trudinger, and John R. Spreiter May 1980 318 p refs
(Contract NASw-3182)
(NASA-CR-3267; NEAR-TR-202) Avail: NTIS HC A14/MF A01 CSCL 03B

Computational procedures are developed and applied to the

prediction of solar wind interaction with nonmagnetic terrestrial planet atmospheres, with particular emphasis to Venus. The theoretical method is based on a single fluid, steady, dissipationless, magnetohydrodynamic continuum model, and is appropriate for the calculation of axisymmetric, supersonic, super-Alfvenic solar wind flow past terrestrial planets. The procedures, which consist of finite difference codes to determine the gasdynamic properties and a variety of special purpose codes to determine the frozen magnetic field, streamlines, contours, plots, etc. of the flow, are organized into one computational program. Theoretical results based upon these procedures are reported for a wide variety of solar wind conditions and ionopause obstacle shapes. Plasma and magnetic field comparisons in the ionosheath are also provided with actual spacecraft data obtained by the Pioneer Venus Orbiter. E.D.K.

HC A03/MF A01 CSCL 03/2

A comparison of spacecraft and IPS(Interplanetary Scintillations) measurements of the solar wind velocity for 1973-75 are presented, when the large scale velocity structure was very stable. From this comparison we infer a prototype distribution across a high speed stream for the electron density fluctuations, delta n sub e, in the spatial frequency range 1/10,000 - 1/100/km. The 'microturbulence' is more closely related to the velocity structure in a stream than to the bulk density; enhancements in delta n sub e occur wherever high speed wind overtakes low speed wind. The distribution of delta n sub e is closely matched by the distribution of magnetic field fluctuations approx. 1/1,000,000 km. GRA

THE COLLECTIVE ACCELERATION MECHANISM OF SOLAR COSMIC RAYS
S. S. Gershtein 1978 21 p refs Submitted for publication (IFVE-OTF-78-112) Avail: International Atomic Energy Agency, Karntner, Ring 11, P.O. Box 590, A-1011 Vienna, Austria

The collective acceleration mechanism of protons and nuclei in solar flares, which lies in the fact that nuclei are trapped by electron bunches moving along the opened lines of force of the decreasing magnetic field of spots, is discussed. The proposed mechanism explains in a natural way the electron and nucleus energy ratio observed during flares. Electron acceleration in the current layers up to energies of the order of a MeV is discussed as a mechanism of electron pulsed injection. The collective acceleration mechanism can be realized at a comparatively small density of the accelerated electrons. Author

OPTIMIZATION TECHNIQUES FOR SHOCK AND VIBRATION ISOLATOR DEVELOPMENT **c39**
R. W. Mayne *In* Shock and Vibration Inform. Center The Shock and Vibration Digest, Vol. 11, No. 10 Oct. 1979 p 25-33 refs (For primary document see N80-24250 14-99)
Avail: NRL, code 8404. Shock and Vibration Inform. Center, Washington, D.C 20375. Annual rate $100.00

Optimization methods with application to shock and vibration isolation are summarized. Included are: nonlinear programming methods that are basic tools for engineering optimization problems of all types, time domain methods of isolator optimization as evolved from optimal control theory; and cases where isolation systems are considered in the frequency domain. R.C.T.

THE SHOCK AND VIBRATION DIGEST, VOLUME 11, NO. 12
Judith Nagle-Eshleman, ed. Dec. 1979 151 p refs
(AD-A079549) Avail: NRL, code 8404. Shock and Vibration Inform. Center, Washington, D.C. 20375. Annual rate $100.00

Methods for studying vehicle-guideway interaction problems are reviewed along with methods for structural analysis under dynamic constraints. An annual index of feature articles, literature, reviews, and book reviews, an author index, and a subject index are included. An abstract bibliography of current literature is included. For individual titles, see N80-24255 through N80-24256.

RESEARCH IN AERONOMY Progress Report, 1 Apr. - 30 Sep. 1979
Belva Edwards, ed. 1979 88 p refs
(Grants NGR-14-005-181; NsG-5213; NsG-7506; NSF ATM-76-01773; NSF ATM-78-21765; NSF ATM-78-15224; Grant NSF ATM-78-12308)
(NASA-CR-153189; PR-79-2) Avail: NTIS HC A05/MF A01 CSCL 05B

Several theoretical, experimental, and instrumentational developments in the field of aeronomy are presented. The forcing and propagation characteristics of planetary waves in the troposhere and middle atmosphere are addressed. Instrument payloads and launch objectives are explained for a number of rocket experiments including radio propagation and energetic particle experiments. The development of rocket-borne microprocessors, a lunar aspect sensor, and a rocket-borne energy spectrometer with solid state detectors are also discussed. The use of partial reflection techniques (to study the D region of the ionosphere), a meteor-radar system (to investigate the dynamics of the meteor region), and coherent and incoherent scatter radars (to study ionized regions) are examined. Finally, a laser radar system designed and constructed to measure the latitude distribution of atmospheric sodium in the 80 to 100 km altitude region is discussed. M.G.

RETROSPECTIVE STUDY OF SELECTED DOD MATERIALS AND STRUCTURES RESEARCH AND DEVELOPMENT PROGRAMS. PHASE 1: CASE HISTORY DATA COLLECTION Interim Report, Feb. 1978 - Feb. 1979

John E. Hove and Leo F. Gowen Mar. 1979 294 p refs

(Contract DAHC15-73-C-0200)

(AD-A080547; AD-E500116; IDA-P-1391; IDA/HQ-79-21258) Avail: NTIS HC A13/MF A01 CSCL 05/1

The DOD recognizes a continuing need to examine and, if possible, improve its investment strategy rationale in all of its R and D. Based on a request of USDR and E(R and AT/ET), the Institute for Defense Analyses undertook a study of R and D planning in the limited area of materials and structures. The objective of the study is to determine if the current R and D planning procedures in materials and structures can be improved. This phase I report is an orderly compilation of pertinent case histories. Evaluation and analysis will be the subject of a future Phase II paper. Pertinent studies of the past, such as HINDSIGHT and TRACES, are reviewed along with the IR and D programs of DOD. Funding histories in materials and structures technology are presented. Some outstanding research programs (6.1 category) sponsored by the Navy, Army, and Air Force are traced from their initial concept to their eventual contribution to the technology base. Selected case histories include the Navy's C4 Missile System program, which exemplifies the careful utilization of materials and structures technology advances by the designers. Other case histories discussed include the history and user acceptance of advanced fibers and composites as primary structural components; the development history of titanium and its uses; the Navy's development and sustained utilization of high-yield strength steels; the development of special aluminum alloys for aircraft and ships, and the growth of the graphitic (graphite and carbon-carbon) materials technology and their high temperature applications. The disappointing results of refractory metals for military applications are also discussed. GRA

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

A

ABSORBERS (MATERIALS)
Intracavity absorber effects in a CW dye laser
[COO-4448-2] N80-23647

ABSORPTION CROSS SECTIONS
Absorption of H and D Lyman-alpha radiation by O2 molecules at high temperatures
[COO-2944-T2] N80-24143

ABSORPTION SPECTRA
Battery-powered, differential infrared absorption sensor for methane, ethane, and other hydrocarbons
[UCRL-83317] N80-23629
Solvent effects on photophysical parameters for coumarin laser dyes
[AD-A081749] N80-23641
High pressure noble gas alkali vapor mixtures and their visible and infrared excimer bands
[AD-A081808] N80-23643
Absorption of H and D Lyman-alpha radiation by O2 molecules at high temperatures
[COO-2944-T2] N80-24143

ABSORPTIVITY
Metal ion reactions with ozone and atomic oxygen
[AD-A081516] N80-23395

ABSTRACTS
The Shock and Vibration Digest, volume 11, no.8
[AD-A073239] N80-24247

ACCELERATED LIFE TESTS
Propellant surveillance report LGM-30 A and B stage 1, TP-H1011
[AD-A081493] N80-23475
On the performance of least squares estimators in type two censored accelerated life tests

ACCELERATION (PHYSICS)
Laminar flow cyclone development program
[FE-3242-2] N80-23613

ACCELERATION STRESSES (PHYSIOLOGY)
Procedure of practical exercise with students on the pathogenic effect of accelerations on the organism
[NASA-TM-76120] N80-23976

ACCELEROMETERS
Data processing systems for accelerometer experiments on air force satellites
[AD-A080460] N80-23910

ACOUSTIC DUCTS
Far-field radiation of aft turbofan noise
[NASA-TM-81506] N80-24129

ACOUSTIC EMISSION
Transducer arrays suitable for acoustic imaging
[AD-A080970] N80-23579

ACOUSTIC MEASUREMENTS
Development of a three-dimensional seismic data acquisition and processing system
[BMFT-FB-T-79-22] N80-23921
Normal mode acoustic scattering from elastic cylindrical shells N80-24127
The interaction of sound with noise in water N80-24128
Hyperbolic fits to time-of-arrival sound ranging measurements
[AD-A080746] N80-24130
Study of an experimental probe for the measurement of the acoustic pressure inside an airflow
[ONERA-NT-1979-5] N80-24133

ACOUSTIC VELOCITY
Further development of seismic methods: Three-dimensional velocity determinations
[BMFT-FB-T-79-19] N80-23925

ACOUSTICAL HOLOGRAPHY
A thermoplastic device for real-time in situ recording of acoustical holograms
[AD-A081011] N80-23624
Improving a real time acoustical holographic system for flaw detection
[AD-A080918] N80-23625

ACOUSTICS
Photolithographic techniques for surface acoustic wave saw devices. Volume 4: Technical and operational parts 4 and 5
[AD-A081126] N80-23571
Recent development for the nonlinear distortion of non-dispersive acoustic waves. Part 2: Multidimensional systems N80-24248

ACRYLIC RESINS
Piezoelectricity in polyacrylonitrile --- as a function of temperature
[AD-A081250] N80-24190

ACTUATORS
The Eccentuator: A new concept in actuation N80-23501
Ball bearing versus magnetic bearing reaction and momentum wheels as momentum actuators N80-23503
Design and development of the quad redundant servoactuator for the space shuttle solid rocket booster thrust vector control N80-23507

ADAPTIVE CONTROL
Use of adaptive optimal control to provide energy conservation in large buildings
[LA-UR-79-3354] N80-23804

ADAPTIVE FILTERS
Efficient adaptive FIR and IIR Filters
[AD-A081605] N80-24158

ADHESIVE BONDING
Adhesive bonding experiments for titanium 6 aluminum 4 vanadium (Ti6Al4V). Part 1: Anodization treatments
[AD-A081538] N80-23432
Surface contamination of adhesive bonding materials
[AD-A081316] N80-23481
The role of chemical bonding in adhesion
[AD-A081881] N80-23482
Study and analysis of a low cost cement bonded flat plate solar collector
[ALO-4122-T1] N80-23816

ADIABATIC CONDITIONS
Parametric performance evaluation and technical assessment of adiabatic compressed air energy storage systems
[EPRI-EM-1188] N80-23796

AERIAL PHOTOGRAPHY
Research for information extraction from aerial imagery
[AD-A080744] N80-23749

AERIAL RECONNAISSANCE
Radiometric measurements by the MIDAS 3 system at Key West. Volume 1: Cloud backgrounds
[AD-A081052] N80-23937

AEROACOUSTICS
On disturbance fields of moving singularities in aerodynamics and aeroacoustics
[ESA-TT-570] N80-23269

AERODYNAMIC CHARACTERISTICS
A study of panel loads and centers of pressure of three different cruciform aft-tail control surfaces of a wingless missile from Mach 1.60 to 3.70
[NASA-TM-81787] N80-23251
Lift, drag and pitching moment measurements on a missile body having various boattails at subsonic and transonic velocities --- in a transonic wind tunnel test
[DFVLR-FB-79-15] N80-23265
Pressure distribution measurements on wedges at subsonic and transonic velocities --- in a transonic wind tunnel
[ESA-TT-554] N80-23267
Afterbody drag and base pressure measurements on a body of revolution at angles of incidence up to alpha = 25 deg at subsonic and transonic Mach numbers --- transonic wind tunnel measurements
[ESA-TT-569] N80-23268
Summary of data required for the AGARD SMP activity standard aeroelastic configurations - two-dimensional configurations
[NLR-MP-79015-U] N80-23273
Wind tunnel tests on the Sheriff twin-engined light aircraft
[BU-241] N80-23277
The aerodynamics of axial flow wind power turbines
[CSIR-ME-1619] N80-23781

AERODYNAMIC COEFFICIENTS
Leeward flow over delta wings at supersonic speeds
[NASA-TM-81187] N80-23250
State and parameter estimation for reentry vehicle lateral motion N80-23345
Measured and predicted shock shapes and aerodynamic coefficients for blunted cones at incidence in air at Mach 5.9
[NASA-TP-1652] N80-23600

AERODYNAMIC CONFIGURATIONS
An analytical study of tilt proprotor aircraft dynamics in airplane cruise configuration including the effects of fuselage longitudinal rigid body motion N80-23297

AIRCRAFT DESIGN

Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance
[NASA-TM-81818] N80-23683

AIRCRAFT ENGINES

Development of improved-durability plasma sprayed ceramic coatings for gas turbine engines
[NASA-TM-81512] N80-23313

Turbopropulsion combustion technology assessment
[AD-A080748] N80-23323

AIRCRAFT FUELS

Research on diamantane and other high density
[AD-A080749] N80-23474

AIRCRAFT GUIDANCE

Theory of disturbance-utilizing control with application to missile intercept problems
[AD-A081110] N80-23329

AIRCRAFT HAZARDS

Storm hazards '79: F-106B operations summary
[NASA-TM-81779] N80-23282

AIRCRAFT LANDING

Investigation of landing flare in presence of wind shear
[DFVLR-FB-79-20] N80-23299

Remote sensing methods for determination of slant range visibility
[DFVLR-FB-79-14] N80-23759

AIRCRAFT MANEUVERS

Air combat maneuvering performance measurement
[AD-A077429] N80-23336

Mathematical model for the separation of gust and manoeuvre loads of civil aircraft
[FB-141(1979)] N80-23674

AIRCRAFT MODELS

Easy-ACIS dynamic analysis. User's manual
[AD-A081160] N80-23258

AIRCRAFT NOISE

Evaluating and minimizing noise impact due to aircraft flyover
[NASA-CR-153187] N80-23874

Study of an experimental probe for the measurement of the acoustic pressure inside an airflow
[ONERA-NT-1979-5] N80-24133

Spectral analysis of non-stationary random processes. Application to noise of flyover type
[ONERA-NT-1979-4] N80-24134

AIRCRAFT SAFETY

Storm hazards '79: F-106B operations summary
[NASA-TM-81779] N80-23282

AIRCRAFT SPIN

A spin-recovery parachute system for light general-aviation airplanes N80-23512

AIRCRAFT STRUCTURES

Failure analysis in aviation
[NLR-MP-79029-U] N80-23284

The failure of aircraft structures
[NLR-MP-78040-U] N80-23285

Flight service evaluation of Kevlar-49 epoxy composite panels in wide-bodied commercial transport aircraft
[NASA-CR-159231] N80-23371

An investigation of residual stresses in simulated wing panels of 7075-T6 aluminum
[AD-A080660] N80-23693

AIRCRAFT TIRES

Flight test evaluation of airborne tire pressure indicating systems
[AD-A081598] N80-23305

AIRCRAFT WAKES

Procedural feasibility of reduced spacing under WVAS operation with applications to Atlanta and O'Hare
[AD-A081480] N80-23287

AIRFOILS

The VISRA-II subsonic aerodynamic nuclear gust vulnerability code
[AD-A081722] N80-23256

Core compressor exit stage study, 2
[NASA-CR-159812] N80-23312

Airplane wing leading edge variable camber flap N80-23514

AIRFRAMES

Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance
[NASA-TM-81818] N80-23683

AIRSPACE

A flight investigation of system accuracies and operational capabilities of a general aviation/air transport area navigation system (RNAV)
[AD-A081646] N80-23298

ALASKA

Comprehensive study of the seismotectonics of the eastern Aleutian arc and associated volcanic systems
[COO-3134-20] N80-23919

ALCOHOLS

Retrospective search on the biochemical production of alcohol fuels
[NP-24137] N80-23476

ALDEHYDES

GC analysis aldehydes: Gas chromatographic analysis of C2-C5 alkanes in air using an isolation and concentration method based on bisulphate adduction formation
[IG-TNO-H-399] N80-23410

ALFALFA

Variability of crop calendar stage dates — Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726

ALGOL

A finite state lexical analyzer for the standard hardware representation of ALGOL 68
[MC-IW-98/78] N80-24023

An algorithm with ALGOL 60 program for the computation of the zeros of ordinary Bessel functions and of their derivatives
[MC-TW-179/78] N80-24024

ALGORITHMS

Design of special-purpose VLSI chips: Example and opinions
[AD-A081451] N80-23567

Solving staircase linear programs by the simplex method. 2. Pricing
[AD-A080838] N80-24003

Comments on Khachian's algorithm for linear programming
[AD-A080837] N80-24004

Automatic factorization of generalized upper bounds in large scale optimization models
[AD-A081614] N80-24017

An algorithm with ALGOL 60 program for the computation of the zeros of ordinary Bessel functions and of their derivatives
[MC-TW-179/78] N80-24024

An algorithm for average costs denumerable state semi-Markov decision problems with applications to controlled production and queueing systems
[MC-BW-94/78] N80-24039

Implementation, interpretation and analysis of a suboptimal boundary finding algorithm
[AD-A081484] N80-24053

Determining feasibility of a set of nonlinear inequality constraints
[AD-A081802] N80-24054

Geometric transforms for fast geometric algorithms
[AD-A081448] N80-24055

Algorithms for testing convexity of digital polygons
[AD-A081476] N80-24057

A note on sparse Quasi-Newton methods
[AD-A081068] N80-24062

Generating all maximal independent sets: NP-hardness and polynomial-time algorithms
[MC-BW-87/78] N80-24068

An adaptive branching rule for the permutation flow-shop problem
[MC-BW-91/78] N80-24115

Deterministic production planning: Algorithms and complexity
[MC-BW-93/78] N80-24116

ALKALI METALS

Negative-hydrogen-ion production by backscattering from alkali-metall targets
[LBL-9992] N80-24144

ALKALIES

Toward an understanding of the mechanical mixed alkali effect in glasses
[AD-A080751] N80-23464

High pressure noble gas alkali vapor mixtures and their visible and infrared excimer bands
[AD-A081808] N80-23643

ALKALINE EARTH METALS
Grids for maintenance-free storage batteries made from lead-akaline earth metal-alloys
[BMFT-FB-T-79-21] N80-23864

ALKANES
GC analysis aldehydes: Gas chromatographic analysis of C2-C5 alkanes in air using an isolation and concentration method based on bisulphate adduction formation
[IG-TNO-H-399] N80-23410

ALLOYS
Creep-rupture behavior of 2-1/4Cr-1 Mo steel, Alloy 800H and Hastelloy Alloy X in a simulated HTGR helium environment
[GA-A-15572] N80-23440
Processing mechanisms, structure and morphology of high temperature polymeric alloys, part 2
[AD-A080068] N80-23457

ALLUVIUM
Integrated surveys of the natural resources in the Amazonia National Park (Topajos) based on LANDSAT images — Brazil
[E80-10109] N80-23736

ALTIMETERS
Validation of ocean tide models from satellite altimetry
[AD-A078294] N80-23961

ALUMINUM
An electron spectroscopic investigation of the interaction of methanol and ammonia with clean and partially oxidized aluminum surfaces N80-23386
Mechanical properties of cold-worked 5083 aluminum
[UCID-18179] N80-23437
The effect of foamed hard plastic stiffeners an aluminum shear webs
[BU-237] N80-23707

ALUMINUM ALLOYS
Metal ion reactions with ozone and atomic oxygen
[AD-A081516] N80-23395
Stress corrosion characteristics of Al-Zn-Mg alloys with copper additions N80-23421
The effect of microstructure on the fatigue behavior of an aluminum-lithium alloy — aluminum lithium manganese alloys N80-23424
Aircraft carrier exposure tests of aluminum alloys
[AD-A081060] N80-23433
Electron beam melt-hardening of aluminum alloys
[BMFT-FB-T-79-20] N80-23446
Gust severity effects on fatigue crack propagation in aluminum alloy sheet materials
[NLR-MP-78041-U] N80-23449
Induced evaporation of metal from an aluminum surface by a normal pulse neodymium laser
[AD-A081601] N80-23638
Evaluation of basic laser welding capabilities
[AD-A077575] N80-23659
Shear lips on fatigue fractures in aluminum alloy sheet material
[LR-287] N80-23675
An investigation of residual stresses in simulated wing panels of 7075-T6 aluminum
[AD-A080863] N80-23693

ALUMINUM CHLORIDES
LiSi and LiB as anodes in chloroaluminate thermal batteries
[AD-A081300] N80-23784

AMINES
Seasonal and geographical distribution of primary amines in Houston atmosphere N80-23872

AMMONIA
An electron spectroscopic investigation of the interaction of methanol and ammonia with clean and partially oxidized aluminum surfaces N80-23386

AMMONIUM PERCHLORATES
Process for the leaching of AP from propellant
[NASA-CASE-NPO-14109-1] N80-23471

AMORPHOUS MATERIALS
Non-destructive evaluation of defects in structural materials using long-wavelength neutrons
[AD-A081097] N80-23665
Model of the recrystallization mechanism of amorphous silicon layers created by ion implantation
[LBL-9990] N80-24196

ANALOG COMPUTERS
Synthesis of optimal filters using microcomputers
[AD-A081045] N80-23995

ANALOG DATA
Flight test evaluation of airborne tire pressure indicating systems
[AD-A081598] N80-23305

ANALYSIS (MATHEMATICS)
Functional and operational advances in the AFGL rocket trajectory system-I
[AD-A081447] N80-23349
A generalization of Decartes' rule
[MC-ZW-115/78] N80-24095

ANALYTICAL CHEMISTRY
Improvements in detection capabilities in atomic spectroscopy N80-23391

ANGULAR RESOLUTION
ORNL 10-m small-angle X-ray scattering camera
[ORNL/TM-6342] N80-23630

ANNEALING
Laser annealing of GaAs
[AD-A081466] N80-23637
Development of pulsed processes for the manufacture of solar cells
[NASA-CR-153188] N80-23771
Development and fabrication of a solar cell junction processing system
[NASA-CR-153194] N80-23773
Laser annealing: Surface epitaxial crystallization, spatial variations measurement, dynamics of annealing and other applications N80-24181
Thin film annealing by ion bombardment
[PB80-125677] N80-24198

ANNUAL VARIATIONS
NOx and O3. Flushing: Air pollution in 1977 — in the Netherlands
[IG-TNO-G-765] N80-23893
A time variable model of Earth's albedo — for climatology studies and interpretation of satellite data
[NASA-CR-159259] N80-23935

ANNULAR FLOW
Measurement of the thickness of liquid film by means of capacitance method
[EPRI-NP-1212] N80-23614

ANODES
ORNL 10-m small-angle X-ray scattering camera
[ORNL/TM-6342] N80-23630
LiSi and LiB as anodes in chloroaluminate thermal batteries
[AD-A081300] N80-23784

ANODIC COATINGS
Adhesive bonding experiments for titanium 6 aluminum 4 vanadium (Ti6Al4V). Part 1: Anodization treatments
[AD-A081538] N80-23432
Interface properties and surface leakage of HcCdTe photodiodes
[AD-A081530] N80-23568

ANOMALIES
Sm-Nd and Rb-Sr chronology of crustal formation. Part 1: Ba, Nd and Sm isotopic anomalies in the Allende meteorite, part 2 N80-24235

ANTENNA ARRAYS
Measured performance characteristics of reflective Butler matrices
[AD-A081002] N80-23541
Study and development of a computer program for analysis of SAR planar array antennas
[S-110-02] N80-23555
The optical processor as an array antenna controller
[AD-A081790] N80-24153

ANTENNA COUPLERS
Dual band combiner for horn antenna
[NASA-CASE-NPO-14519-1] N80-23524

ANTENNA FEEDS
Measured performance characteristics of reflective Butler matrices
[AD-A081002] N80-23541

ANTENNA RADIATION PATTERNS
The optical processor as an array antenna controller
[AD-A081790] N80-24153

ANTIICING ADDITIVES
Carburetor ice: A review N80-23278
Carburetor ice: A review
[TR-79-9] N80-23279
Carburetor ice: A review
[TR-77-19] N80-23280

APERTURES
Streakcamera aperture function
[UCID-18520] N80-23633

APEXES
The structure of minimal graphs with given abelian automorphism group N80-24042

APPLICATIONS OF MATHEMATICS
Passive solar calculation methods
[DSE/5221-T1] N80-23836

APPLICATIONS PROGRAMS (COMPUTERS)
Computer processing support, volume 4
[E80-10116] N80-23743

APPROPRIATIONS
National Aeronautics and Space Administration Authorization Act, 1981
[S-96-719] N80-24210

APPROXIMATION
Further development of seismic methods. Three-dimensional migration/approximation procedure
[BMFT-FB-T-79-18] N80-23924
Numerical methods for solution of the shallow-water equations in meteorology
[CSIR-SR-WISK-10] N80-23936
Uniform linear approximation in normed linear spaces
[CSIR-TWISK-114] N80-24046
A note on sparse Quasi-Newton methods
[AD-A081068] N80-24062
Semi-discretization methods for partial differential equations on nonrectangular grids
[MC-NW-56/78] N80-24074
Computations concerning the conjecture of Mertens
[MC-NW-64/78] N80-24079
Sampling representations and approximations for certain functions and stochastic processes
[AD-A081533] N80-24102

AQUEOUS SOLUTIONS
Aqueous solutions database to high temperatures and pressures: NaCl solutions
[LBL-9621] N80-23399

AQUIFERS
Optimal design of compressed air energy storage systems
[CONF-791069-3] N80-23789
Investigation of the technical and economic feasibility of using pumped well-water energy storage systems
[SAND-79-7096] N80-23851

ARCHITECTURE (COMPUTERS)
A dynamically reconfigurable distributed computing system — integrating pipelining and parallel processing N80-23989
ZMOB: A mob of 256 cooperative z80A-based microcomputers
[NASA-CR-163129] N80-23991
Interconnection network in multiple-processor systems
[AD-A080959] N80-23993

ARGON
Measurements of the total elastic scattering cross section for argon on argon at collision energies below four millivolts N80-24136
Thin film annealing by ion bombardment
[PB80-125677] N80-24198

ARITHMETIC
Complex arithmetic in FORTRAN
[NPL-NACS-23/79] N80-24031

ARIZONA
Integrated use of LANDSAT data for state resource management — Arizona, Georgia, North Dakota, and Texas
[E80-10095] N80-23722

ARKANSAS
Variability of crop calendar stage dates — Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726

ARRESTING GEAR
Investigation of landing flare in presence of wind shear
[DFVLR-FB-79-20] N80-23299

ARTERIES
Coronary plexus in man and monkey N80-23971

ARTERIOSCLEROSIS
Possibilities of forecasting hypercholesterinemia in pilots
[NASA-TM-76087] N80-23975

ARTIFICIAL RADIATION BELTS
Predictions of GPS X-Set performance during the places experiment
[AD-A081552] N80-23292

ASBESTOS
Assessment of potential exposure to friable insulation materials containing asbestos
[NASA-TM-81435] N80-23875

ASPECT RATIO
Core compressor exit stage study, 2
[NASA-CR-159812] N80-23312

ASTRONOMICAL MODELS
Cosmology: Citations from the NTIS data base
[PB80-804818] N80-24231

ASTRONOMICAL PHOTOMETRY
Ground-based measurements of sources in the AFGL infrared sky survey — using astronomical photometry
[AD-A081381] N80-24222

ASTRONOMICAL TELESCOPES
Development of new technologies for ultra-precise large-scale astronomical instruments, in particular mirror telescopes
[BMFT-FB-T-79-10] N80-24163

ASYMPTOTIC SERIES
Expected number of vertices of a random convex polytope. I: Integral formula and asymptotic bounds
[AD-A080191] N80-24048

ATLANTIC OCEAN
LANDSAT's role in state coastal management programs — New Jersey and Texas
[E80-10101] N80-23726

ATLAS LAUNCH VEHICLES
Fuel/hydraulic transfer valve improves reliability of Atlas space launch vehicle N80-23509

ATMOSPHERIC ATTENUATION
Atmospheric Rayleigh scattering in the ultraviolet and visible spectral region
[ESA-TT-588] N80-23926

ATMOSPHERIC CHEMISTRY
The mechanisms of the SAMS experiment flown on Nimbus 7 with particular reference to the 2 axis scanning mirror — infrared radiometer for stratospheric and mesospheric investigations N80-23522

ATMOSPHERIC CIRCULATION
Project severe environmental storms and mesoscale experiment
[PB80-119902] N80-23950

ATMOSPHERIC COMPOSITION
Chelate-modified polymers for atmospheric gas chromatography
[NASA-CASE-ARC-11154-1] N80-23383
Chabot Observatory Remote Sensing Experiments (CORSE) — determining the relationship between weather and air pollution
[UCID-18504] N80-23758
Role of Temperate Zone Forests in the World Carbon Cycle: Problem definition and Research Needs — conferences
[DOE/ET/10040-1] N80-23883
Comparative investigation into the reliability of various analysis methods for formaldehyde in air
[IG-TNO-F-1643] N80-23886
Air pollution in Delft, 1977
[IG-TNO-G-764] N80-23892
Analysis of high sulfate concentrations in greater New York City air
[PB80-128515] N80-23906
Spatial variability of ozone and other pollutants at St. Louis, Missouri
[PB80-132830] N80-23930
Climatic changes from increased atmospheric carbon dioxide. Citations from the NTIS data base
[PB80-805427] N80-23953
Global geochemical problems N80-23956

ATMOSPHERIC DENSITY
Data processing systems for accelerometer experiments on air force satellites
[AD-A080460] N80-23913

ATMOSPHERIC DIFFUSION
Evaluation of empirical atmospheric diffusion data
[NUREG-CR-0789] N80-23879
Mathematical models for atmospheric pollutants. Appendix C: Governing equations for atmospheric trace constituents and solution techniques
[EPRI-EA-1131-APP-C] N80-23880
Spatial variability of ozone and other pollutants at St. Louis, Missouri
[PB80-132830] N80-23930

ATMOSPHERIC EFFECTS
Climatic changes from increased atmospheric carbon dioxide. Citations from the NTIS data base
[PB80-805427] N80-23953

ATMOSPHERIC ELECTRICITY
A survey of the high frequency effects associated with the lightning discharge
[OUEL-1290/79] N80-23590
Thundercloud electrification models in atmospheric electricity and meteorology
[NASA-CR-161441] N80-23932

ATMOSPHERIC HEAT BUDGET
Experimental investigation of an inexpensive sky temperature measuring device
[COO-4522-1] N80-23945

ATMOSPHERIC MODELS
General perturbations theories derived from the 1965 lane drag theory
[AD-A081264] N80-23347
Development and evaluation of adaptive techniques for reducing ionospheric-induced radar tracking errors in real time
[AD-A081460] N80-23544
Development of a regional transport/transformation/removal model for SO2 and sulfate in the eastern United States N80-23871
Mathematical models for atmospheric pollutants. Appendix D: Available air quality models
[EPRI-EA-1131-APP-D] N80-23884
Kwajalein reference atmospheres, 1979
[AD-A081780] N80-23915
Thundercloud electrification models in atmospheric electricity and meteorology
[NASA-CR-161441] N80-23932

ATMOSPHERIC PHYSICS
Laser communication climatology study
[AD-A081656] N80-23546

ATMOSPHERIC RADIATION
The measurement of the transmission and the emission of the atmosphere by an infrared teleradiance meter
[PHL-1978-50] N80-23923

ATMOSPHERIC REFRACTION
Development and evaluation of adaptive techniques for reducing ionospheric-induced radar tracking errors in real time
[AD-A081460] N80-23544
Shuttle program: Computing atmospheric scale height for refraction corrections
[NASA-TM-81059] N80-23911

ATMOSPHERIC TEMPERATURE
Statistical retrieval of temperatures from SCR-B, at 10 to 0.4 MB
[AD-A077359] N80-23941

ATMOSPHERIC TURBULENCE
Mathematical model for the separation of gust and manoeuvre loads of civil aircraft
[FB-141(1979)] N80-23674
Detection of clear-air turbulence by water vapour emission variations: Transmittances and weighting functions
[PB80-130339] N80-23952

ATMOSPHERIC WINDOWS
Atmospheric effects on millimeter radio waves
[AD-A081414] N80-23547

ATOMIC BEAMS
Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation
[LBL-9611] N80-24142

ATOMIC CLOCKS
A comparison of intercontinental clock synchronization by VLBI and the NTS satellite
[NASA-TM-81063] N80-24124

ATOMIC ENERGY LEVELS
Measurements of the total elastic scattering cross section for argon on argon at collision energies below four millivolts N80-24136
Coherent transient effect studies of Rydberg atoms
[AD-A081746] N80-24140

ATOMIC EXCITATIONS
Scattering of low-energy electrons by laser excited sodium atoms in the 3 2P 3/2 state N80-24137
Studies of laser selective excitation of atoms — radiative lifetimes, plasma diagnostics, and vapor ionization
[UTIAS-229] N80-24138

ATOMIC SPECTRA
Improvements in detection capabilities in atomic spectroscopy N80-23391

ATOMIC STRUCTURE
Thin film annealing by ion bombardment
[PB80-125677] N80-24198

ATTENUATORS
Pulse transducer with artifact signal attenuator — heart rate sensors
[NASA-CASE-FRC-11012-1] N80-23969

AUTOCORRELATION
Efficient estimation of multivariate moving average autocovariances
[AD-A081173] N80-24059

AUTOMATED GUIDEWAY TRANSIT VEHICLES
Vehicle-guideway interaction problems N80-24255

AUTOMATIC CONTROL
Navigation, guidance, and control for helicopter automatic landings
[NASA-TP-1649] N80-23326
Automated beam builder N80-23516
Planning of automated data acquisition and process control systems (ADACS)
[AD-A081043] N80-23994

AUTOMATIC LANDING CONTROL
Navigation, guidance, and control for helicopter automatic landings
[NASA-TP-1649] N80-23326

AUTOMATIC TEST EQUIPMENT
AN/TPQ-37 transmitter test bed
[AD-A081591] N80-23576

AUTOMATION
Automation in photogrammetry — use of digital image processing technology
[AD-A081562] N80-23750
Initial conceptualization and characterization of a Navy automated publishing, volume 2
[AD-A080479] N80-24203

AUTOMOBILE ENGINES
Development of high temperature resistant ceramic parts for gas turbines
[BMFT-FB-T-79-09] N80-23324
Fuel consumption measurements-carbon balance versus flow meter
[PB80-128549] N80-24218

AUTOMOBILES
Electric and hybrid vehicle program
[DOE/CS-0026] N80-24216

AUTOMORPHISMS
The structure of minimal graphs with given abelian automorphism group N80-24042

AUTOREGRESSIVE PROCESSES
Modern methods of multiple spectral density estimation
[AD-A081172] N80-24058
Maximum likelihood estimation for an autoregressive process with missing observations
[AD-A081251] N80-24107

AUXILIARY POWER SOURCES
Off-peak electric auxiliary heat for solar air-heating systems
[COO-4516-1] N80-23827

AVALANCHE DIODES
A 3-5 heterostructure avalanche photodiode modules for fiber optic communication links in the 1.0 to 1.3 micrometer spectral range
[AD-A081185] N80-23539
HgCdTe avalanche photodiode development
[AD-A081595] N80-24193

AXIAL FLOW
Axial flow rotor unsteady performance N80-23308
The aerodynamics of axial flow wind power turbines
[CSIR-ME-1619] N80-23781

AXIAL FLOW TURBINES
Axial flow rotor unsteady performance
[AD-A081107] N80-23318

AZIMUTH
Nationwide forestry applications program: Corrections to forest reflectance as a function of low Sun angle and slope — Washington County, Missouri
[E80-10100] N80-23727

B

B STARS
The shell episode of 59 Cygni (1974-1975): Rotating magnetic winds? N80-24221
BACKSCATTERING
The Urbana coherent-scatter radar: Synthesis and first results
[NASA-CR-153186] N80-23531
Atmospheric effects on millimeter radio waves
[AD-A081414] N80-23547
Backscattering programs for spherical targets
[AD-A081094] N80-24131
Negative-hydrogen-ion production by backscattering from alkali-metal targets
[LBL-9992] N80-24144
BACTERICIDES
Effect of hydrogen chloride on the morphology of Bacillus subtilis spores N80-23967
Sterilization by means of hydrogen chloride: Influence of process parameters on the biocidal activity N80-23968
BAILOUT
Emergency in-flight egress opening for general aviation aircraft — pilot bailout N80-23511
BALLS
Quartz ball valve
[NASA-CASE-NPO-14473-1] N80-23654
BANACH SPACE
Uniform linear approximation in normed linear spaces
[CSIR-TWISK-114] N80-24046
BAND STRUCTURE OF SOLIDS
Electronic structure of semiconducting surface inversion layers — energies of subbands N80-24183
Studies in the theory of solids
[COO-1198-1283] N80-24194
BANDWIDTH
Dual band combiner for horn antenna
[NASA-CASE-NPO-14519-1] N80-23534
BARLEY
Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720
Variability of crop calendar stage dates — Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748
BARS (LANDFORMS)
Pointbars: A comparative examination along the large Dutch rivers — Netherlands
[REPT-2] N80-23760
BARYONS
Synthesis of baryons from unconfined quarks
[ORO-3992-371] N80-24147
BASALT
Occurrence and mineral chemistry of high pressure phases, Portrillo basalt, southcentral New Mexico
[NASA-CR-153192] N80-23909
BATTERY CHARGERS
The ac-dc power processor, type 1
[AD-A081545] N80-23577
BAYES THEOREM
Bayesian concepts for reliability and statistical decision theory for structural design N80-23493
BAYS (TOPOGRAPHIC FEATURES)
LANDSAT's role in state coastal management programs — New Jersey and Texas
[E80-10101] N80-23728
BEAMS (RADIATION)
Electromagnetic interaction of colliding beams on storage rings
[BNL-27035] N80-23549
BEAMS (SUPPORTS)
Automated beam builder N80-23516
Tensile crack exposure tests. Report 3: Laboratory evaluation of series A beams with results from 1951 to 1975
[AD-A081302] N80-23692
Chances and handicaps of rod-beam theories
[ESA-TT-588] N80-23705
BEARINGS
Ball bearing versus magnetic bearing reaction and momentum wheels as momentum actuators N80-23503
A precision bearing gimbal system for the Teal Ruby program N80-23508
Economical drive for large tube mills by means of planetary gears
[NASA-TM-75808] N80-23656
Magnetic bearing support study for a 10 kW-hr energy storage flywheel
[SAND-79-7025] N80-23661
BEDS (PROCESS ENGINEERING)
Test and evaluate the TRI-GAS low-Btu coal gasification process
[FE-2798-68] N80-23484
BEECHCRAFT AIRCRAFT
Characterization of visibility-reducing aerosols in the Southwest. Project VISTA
[PB80-139041] N80-23929
BESSEL FUNCTIONS
An algorithm with ALGOL 60 program for the computation of the zeros of ordinary Bessel functions and of their derivatives
[MC-TW-179/78] N80-24024
BIBLIOGRAPHIES
Cryogenic wind tunnels: A selected, annotated bibliography
[NASA-TM-80168] N80-23333
Power metallurgy of titanium and titanium alloys. Citations from the Engineering Index data base
[PB80-805161] N80-23450
The chemistry of silicone resins, volume 1. Citations from the NTIS data base
[PB80-804362] N80-23469
Climatic changes from increased atmospheric carbon dioxide. Citations from the NTIS data base
[PB80-805427] N80-23953
Microwave investigations of matter — bibliographies
[AD-A081708] N80-24141
Cosmology: Citations from the NTIS data base
[PB80-804618] N80-24231
BIG BANG COSMOLOGY
Helium abundances in young clusters and associations N80-24227
BINARY ALLOYS
Electron beam melt-hardening of aluminum alloys
[BMFT-FB-T-79-20] N80-23446
BINARY CODES
Binary codes with minimum distance four
[MC-ZW-112/78] N80-24093
BINOMIAL THEOREM
A note on the median of the binomial distribution
[MC-SW-59/78] N80-24061
BIOASSAY
Methods for the isolation and identification of polycyclic aromatic hydrocarbons found in complex mixtures and their possible toxicity by means of bioassay techniques N80-23399
BIOCHEMISTRY
Retrospective search on the biochemical production of alcohol fuels
[NP-24137] N80-23476
BIOGRAPHY
The mathematician Gauss, seen from the point of view of a space technologist — Carl Friedrich Gauss
[TUM-LRT-KB-14/77] N80-23342
BIOINSTRUMENTATION
Pulse transducer with artifact signal attenuator — heart rate sensors
[NASA-CASE-FRC-11012-1] N80-23969
Positron emission tomography of the heart
[UCLA-12-1232] N80-23980
BIOLOGICAL EFFECTS
Proceedings of the Workshop on Electrical and Biological Effects Related to HVDC Transmission
[PNL-3121] N80-23979
Study of the possible effects of 110 kHz electromagnetic fields on humans
[SAND-77-7029] N80-23981
BIOLUMINESCENCE
Mechanism of energy conversion and transfer in bioluminescence
[SRO-635-7] N80-23787
BIOMASS ENERGY PRODUCTION
Carbohydrate crops as a renewable resource for fuels production. Volume 1: Agricultural research
[BMI-2031-VOL-1] N80-23481
Research and evaluation of biomass resources/conversion/utilization systems (market/experimental analysis for development of a data base for a fuels from biomass model)
[COO-5022-9] N80-23486
Research and evaluation of biomass resources/conversion/utilization systems (market/experimental analysis for development of a data base for a fuels from biomass model)
[COO-5022-8] N80-23487
Production of sugarcane and tropical grasses as a renewable energy source
[ORO-5912-T1] N80-23840
Environmental development plan for biomass energy systems
[DOE/EDP-0032] N80-23876
BIRDS
The application of remote sensing technology to the solution of problems in the management of resources in Indiana — pheasant habitats in Benton County, soil mapping in Jasper County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23738
BISMUTH ALLOYS
Directional solidification of manganese-bismuth/bismuth alloys N80-23422
BIVARIATE ANALYSIS
Bivariate normal, conditional and rectangular probabilities: A computer program with applications
[NASA-TM-81350] N80-24099
BLACK HOLES (ASTRONOMY)
Vacuum black hole gravitational wave cross sections N80-24220
BLADE TIPS
Surface pressure measurements at two tips of a model helicopter rotor in hover
[NASA-CR-3281] N80-23252
BLUNT BODIES
Measured and predicted shock shapes and aerodynamic coefficients for blunted cones at incidence in air at Mach 5.9
[NASA-TP-1652] N80-23600
BOATTAILS
Lift, drag and pitching moment measurements on a missile body having various boattails at subsonic and transonic velocities — in a transonic wind tunnel test
[DFVLR-FB-79-15] N80-23265
BODIES OF REVOLUTION
Afterbody drag and base pressure measurements on a body of revolution at angles of incidence up to alpha = 25 deg at subsonic and transonic Mach numbers — transonic wind tunnel measurements
[ESA-TT-569] N80-23268
A higher order surface singularity method for the axisymmetric inverse problem
[AD-A081797] N80-23604
BODY CENTERED CUBIC LATTICES
The effects of deformation mode on the behavior of Ti-28%V and Ti-32%V alloys N80-23423
BODY COMPOSITION (BIOLOGY)
Relationship between urinary 3-methylhistidine excretion and components of body composition in man N80-23972
BODY KINEMATICS
The Roberson/Wittenburg formalism and the package MULTIBODY for computer simulations of multibody systems
[ESA-TT-557] N80-24097
BOOMS (EQUIPMENT)
The Magsat magnetometer boom N80-23517
BORON-EPOXY COMPOUNDS
Ultrasonic nondestructive testing of materials — graphite-epoxy and boron-epoxy composite materials
[AD-A078370] N80-23667
BOUNDARY LAYER FLOW
On Goertler instability
[AD-A081255] N80-23602
BOUNDARY LAYER PLASMAS
Plasma boundary collisionless absorption effects in the loading of RF conductors
[AD-A081115] N80-24167
Remarks on the use of deposition probes for analysis of tokamak boundary-layer plasmas
[ORNL/TM-7034] N80-24173
BOUNDARY LAYER SEPARATION
Prediction of separating turbulent boundary layers including regions of reversed flow
[AD-A081592] N80-23608

BOUNDARY LAYER TRANSITION
Morphological-phenomenological examination of the interaction of two ring vortices with the same translation axis and direction
[MPIS-20/1978] N80-23262
The thermal and hydrodynamic behavior of thick, rough-wall, turbulent boundary layers N80-23592
BOUNDARY LAYERS
Laminar flow cyclone development program
[FE-3242-2] N80-23613
BOUNDARY VALUE PROBLEMS
Finite element analysis of subsonic, transonic and supersonic flows around missiles
[AD-A077375] N80-23261
Boundary value problems of the circular cylinders in the strain-gradient theory of linear elasticity
[GA-A-15142] N80-23701
Boundary conditions for the numerical solution of elliptic equations in exterior regions
[NASA-CR-153185] N80-24044
Eigenvalue and near Eigenvalue problems solved by Brandt's multigrid method
[AD-A081318] N80-24052
Implementation, interpretation and analysis of a suboptimal boundary finding algorithm
[AD-A081484] N80-24053
Separating variables in two-way diffusion equations
[PPPL-1596] N80-24066
The application of iterated defect correction to the LOD method for parabolic equations
[MC-NW-58/78] N80-24075
Error bounds for exponentially fitted Galerkin methods applied to stiff two-point boundary value problems
[MC-NW-62/78] N80-24077
BRAKES (FOR ARRESTING MOTION)
Centrifugal regulator for control of deployment rates of deployable elements N80-23504
BRANCHING (MATHEMATICS)
On the computational complexity of branch and bound search strategies
[AD-A081608] N80-24051
An adaptive branching rule for the permutation flow-shop problem
[MC-BW-91/78] N80-24115
BRAYTON CYCLE
Research and development of an air-cycle heat-pump water heater
[ORNL/SUB-7226/1] N80-23850
BRIGHTNESS TEMPERATURE
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
BRINES
Aqueous solutions database to high temperatures and pressures: NaCl solutions
[LBL-9621] N80-23399
BUCKLING
Computer analysis of shells and composites
[AD-A081469] N80-23690
BULK ACOUSTIC WAVE DEVICES
OSCEE fan exhaust bulk absorber treatment evaluation
[NASA-TM-81498] N80-23314
BURNING RATE
Exploring new concepts for elucidating processes occurring in pyrotechnic flares and for generating aerosol dispersions
[AD-A080731] N80-23473

C

C-135 AIRCRAFT
Wind tunnel investigation of an all flush orifice air data system for a large subsonic aircraft --- conducted in a Langley 8 foot transonic pressure tunnel
[NASA-TP-1642] N80-23304
CABLES (ROPES)
Dynamics of a moving mass being abruptly stopped by a cable
[AD-A081158] N80-23687
CADMIUM SULFIDES
Solar cell heterojunctions involving N-cadium sulfide and certain P-type semiconductor single crystals N80-23766
CADMIUM TELLURIDES
Properties of sputtered ITO/CdTe solar cells N80-23767
HgCdTe avalanche photodiode development
[AD-A081595] N80-24193
CALCULUS
A fractional integral operator corresponding to negative powers of a certain second order differential operator
[MC-TW-182/78] N80-24086
Interpolation for fragments of the propositional calculus
[MC-ZW-116/78] N80-24096
CALIFORNIA
California Sea Grant College Program: An overview 1977 - 1978
[PB80-127988] N80-23964
CAMBER
Airplane wing leading edge variable camber flap N80-23514
CAMERAS
ORNL 10-m small-angle X-ray scattering camera
[ORNL/TM-6342] N80-23630
Constant magnification optical tracking system
[NASA-CASE-NPO-14813-1] N80-24152
CANADA
Canada: Estimates of future energy/GNP relationships
[ORAU/IEA(M)-79-24] N80-23849
CANS
Drawer drive for space shuttle vacuum canister --- long duration exposure facility N80-23518
CAPACITANCE
Measurement of the thickness of liquid film by means of capacitance method
[EPRI-NP-1212] N80-23614
CAPACITORS
A new method of roundness measurement by capacitive detectors
[ONERA-NT-1979-9] N80-23523
CARBOHYDRATES
Retrospective search on the biochemical production of alcohol fuels
[NP-24137] N80-23476
CARBON
Modeling the circulation of carbon in the world's terrestrial ecosystems
[DOE/TIC-10293] N80-23710
Role of Temperate Zone Forests in the World Carbon Cycle: Problem definition and Research Needs --- conferences
[DOE/ET/10040-1] N80-23883
Gas and aerosol fluxes --- emphasizing sulfur, nitrogen, and carbon N80-23959
CARBON DIOXIDE CONCENTRATION
Climatic changes from increased atmospheric carbon dioxide. Citations from the NTIS data base
[PB80-805427] N80-23953
Global geochemical problems N80-23958
CARBON DIOXIDE LASERS
Evaluation of basic laser welding capabilities
[AD-A077575] N80-23659
CARBON FIBERS
Definition and modeling of critical flaws in graphite fiber reinforced resin matrix composite materials
[AD-A080893] N80-23376
CARBON MONOXIDE
Examination of the reactions of O+ with CH4, C2H4, C2H6, C3H8 and N+ with CO by measurement of the luminescence and the translational energy of the product ions
[MPIS-9/1979] N80-23405
A surface analysis study of carbon monoxide and hydrogen absorption and desorption of Ni(3) crystals --- catalytic reactivity N80-23425
Spatial variability of ozone and other pollutants at St. Louis, Missouri
[PB80-132830] N80-23930
CARBON STEELS
Metastable phenomena in hydrogen degradation of low carbon alloy steels
[EPRI-AF-1176] N80-23438
CARBON TETRAFLUORIDE
Gladstone-Dale constant for CF4 --- experimental design
[NASA-TM-80228] N80-24151
CARBONIZATION
Metastable phenomena in hydrogen degradation of low carbon alloy steels
[EPRI-AF-1176] N80-23438
CARBURETORS
Carburetor ice: A review N80-23278
Carburetor ice: A review
[TR-79-9] N80-23279
Carburetor ice: A review
[TR-77-19] N80-23280
CARDIOVASCULAR SYSTEM
Time for recovery from successive bouts of exercise as measured by changes in the anaerobic threshold: A comparison of recovery intervals of 24 and 48 hours N80-23970
Possibilities of forecasting hypercholesterinemia in pilots
[NASA-TM-76087] N80-23975
CARGO AIRCRAFT
Conceptual studies of a long-range transport with an upper surface blowing propulsive lift system
[NASA-TM-81196] N80-23249
CASCADE FLOW
Unsteady aerodynamic forces on a subsonic rectilinear cascade of blades
[PNR-90007] N80-23266
Flutter stabilities in an annular cascade with supersonic relative flow
[ESA-TT-610] N80-23271
Computer programs for calculating partially cavitating blunt trailing edged cascade flows in nonlinear theory
[AD-A081832] N80-23610
CASCADE WIND TUNNELS
Investigation into compressor aeroelastic instabilities in a wind tunnel for a rectilinear cascade of blades
[PNR-90011] N80-23337
CASTING
Investigations into the grain refinement of copper N80-23420
CATALOGS (PUBLICATIONS)
Seismic data catalog and associated graphical capabilities
[PNL-2893] N80-23918
DTIC cataloging guidelines
[AD-A080600] N80-24204
CATALYSTS
Methanol and methyl fuel catalysts --- CuO/ZnO catalysts
[FE-3177-3] N80-23482
The effect of catalyst length and downstream reactor distance on catalytic combustor performance
[NASA-TM-81475] N80-23779
CATALYTIC ACTIVITY
A surface analysis study of carbon monoxide and hydrogen absorption and desorption of Ni(3) crystals --- catalytic reactivity N80-23425
CATIONS
Molten carbonate fuel cell program. Composition gradients induced by current flow in Li2CO3-K2CO3 mixtures
[ORNL/TM-7061] N80-23839
CAVITATION FLOW
Finite element simulation of simple three-dimensional fully cavitating flows N80-23594
CAVITIES
Efficiency improvements in coupled cavity traveling wave tubes
[AD-A080961] N80-23575
CAVITY RESONATORS
Passive ring resonator laser gyroscope
[AD-A081649] N80-23627
CDC COMPUTERS
Some statistics on ALGOL 68 programs
[MC-IW-109/79] N80-24032
CEMENTS
Economical drive for large tube mills by means of planetary gears
[NASA-TM-75808] N80-23656
CENTRAL NERVOUS SYSTEM
Procedure of practical exercise with students on the pathogenic effect of accelerations on the organism
[NASA-TM-76120] N80-23976
CENTRAL PROCESSING UNITS
Operations manual for the LANDSAT Imagery, Verification and Extraction System (LIVES)
[E80-10090] N80-23717
CENTRIFUGAL FORCE
Centrifugal regulator for control of deployment rates of deployable elements N80-23504
CENTRIFUGES
Laminar flow cyclone development program
[FE-3242-2] N80-23613

CERAMIC COATINGS
Significance of thermal contact resistance in two-layer thermal-barrier-coated turbine vanes
[NASA-TM-81483] N80-23310
Development of improved-durability plasma sprayed ceramic coatings for gas turbine engines
[NASA-TM-81512] N80-23313
CERAMICS
Application of ceramic nozzles to 10 KW engine
[AD-A081184] N80-23320
Property screening and evaluation of ceramic turbine engine materials
[AD-A080963] N80-23322
Development of high temperature resistant ceramic parts for gas turbines
[BMFT-FB-T-79-09] N80-23324
Program to study SIC fiber reinforced glass matrix composites
[AD-A077638] N80-23379
Sinterable powers from laser driven reactions
[AD-A081709] N80-23460
Thermal conductivity and diffusivity of engineering ceramics
[AD-A078540] N80-23465
CERIUM
Chemical decontamination of metals --- treatment with a cerium-nitric acid solution
[HEDL-SA-1880] N80-23442
CERIUM OXIDES
Methanol and methyl fuel catalysts --- CuO/ZnO catalysts
[FE-3177-3] N80-23482
CHANNELS (DATA TRANSMISSION)
Channels that cooperatively service a data stream and voice messages, 1
[AD-A081616] N80-23538
CHARACTERIZATION
Characterization of digital filters used in Sandia Laboratories Test Data Analysis Division
[SAND-79-1230] N80-23582
CHARGE TRANSFER
Charge transfer processes in astrophysical plasmas N80-24230
CHARGED PARTICLES
Energetic particle studies: Instrumentation and analysis
[AD-A081714] N80-23350
Chemical physics of charge mechanisms in nonmetallic spacecraft materials
[AD-A081487] N80-23363
Emission of particles from a charged sphere into a magnetic field
[AD-A081781] N80-24123
CHELATES
Chelate-modified polymers for atmospheric gas chromatography
[NASA-CASE-ARC-11154-1] N80-23383
CHEMICAL ANALYSIS
The identification of chromatographically separated fractions by Fourier transform infrared spectroscopy N80-23387
Methods for the isolation and identification of polycyclic aromatic hydrocarbons found in complex mixtures and their possible toxicity by means of bioassay techniques N80-23398
Analytical chemical system for the determination of heavy metals and organic compounds
[COO-4320-2] N80-23402
C2-C6 hydrocarbons in air: Gas chromatographic analysis of C2-C6 hydrocarbons in air using a concentrating technique
[IG-TNO-H-393] N80-23409
Surface contamination of adhesive bonding materials
[AD-A081316] N80-23461
Explosives research and development: Recommendations and comments on unsolved problems
[LA-8124-MS] N80-23488
Comparative investigation into the reliability of various analysis methods for formaldehyde in air
[IG-TNO-F-1643] N80-23888
Occurrence and mineral chemistry of high pressure phases, Portrillo basalt, southcentral New Mexico
[NASA-CR-153192] N80-23909
CHEMICAL ATTACK
Metastable phenomena in hydrogen degradation of low carbon alloy steels
[EPRI-AF-1176] N80-23438
Hydrogen attack of steel
[COO-2872-04] N80-23439
CHEMICAL BONDS
Development of dynamic NMR pulse techniques and applications to membrane permeation and peptide bond rotation kinetics N80-23384
The role of chemical bonding in adhesion
[AD-A081661] N80-23462
CHEMICAL COMPOSITION
Determination of the effect of composition, structure and electrochemical mass transport properties on adhesion and corrosion inhibition of paint films
[AD-A080960] N80-23578
Molten carbonate fuel cell program. Composition gradients induced by current flow in Li2CO3-K2CO3 mixtures
[ORNL/TM-7061] N80-23839
CHEMICAL COMPOUNDS
System requirements analysis for the Chemical Structure and Nomenclature System (CSNS)
[PB80-105216] N80-24207
CHEMICAL ENERGY
Initiation of granular explosives by ramp waves
[SAND-79-1169C] N80-23480
CHEMICAL EQUILIBRIUM
Development of low pressure brackish water reverse osmosis membranes
[PB80-126204] N80-23415
CHEMICAL EXPLOSIONS
Performance and properties of extrusion cast explosives composed of HMX, FEFO and AFNOL
[UCID-18333] N80-23479
Initiation of granular explosives by ramp waves
[SAND-79-1169C] N80-23480
CHEMICAL LASERS
Inhomogeneous broadening effects in CW chemical lasers
[AD-A077319] N80-23435
CHEMICAL REACTIONS
Rate constant for the reaction of hydroxyl radical with formaldehyde over the temperature range 228-362 K
[NASA-TM-80666] N80-23393
Analytical chemical system for the determination of heavy metals and organic compounds
[COO-4320-2] N80-23402
Chemical reactions in a turbulent medium
[ONERA-NT-1979-2] N80-23412
Formation of porous surface layers in reaction bonded silicon nitride during processing
[NASA-TM-81493] N80-23456
Sinterable powers from laser driven reactions
[AD-A081709] N80-23460
Toward an understanding of the mechanical mixed alkali effect in glasses
[AD-A080751] N80-23464
The chemistry of silicone resins, volume 1. Citations from the NTIS data base
[PB80-804362] N80-23469
Research on diamantane and other high density
[AD-A080749] N80-23474
CHIPS (ELECTRONICS)
Design of special-purpose VLSI chips: Example and opinions
[AD-A081451] N80-23567
CHLORINATION
Source assessment: Chlorinated hydrocarbons manufacture --- pollution monitoring
[PB80-138209] N80-23418
CHLOROPHYLLS
Studies of photosynthetic membranes using chlorophyll fluorescence lifetimes
[LBL-9795] N80-23966
CHOLESTEROL
Possibilities of forecasting hypercholesterinemia in pilots
[NASA-TM-76087] N80-23975
CHROMATOGRAPHY
The identification of chromatographically separated fractions by Fourier transform infrared spectroscopy N80-23387
CHROMOSPHERE
The effect of transport phenomena on electron velocity distribution functions and ion abundances in the solar chromosphere-corona transition region N80-24239
CIRCUIT RELIABILITY
Latch-up control in CMOS integrated circuits
[SAND-79-1479C] N80-23583
CIRCUITS
On the advanced power system configuration study
[TP-7753] N80-23355
CIRCULAR CYLINDERS
Boundary value problems of the circular cylinders in the strain-gradient theory of linear elasticity
[GA-A-15142] N80-23701
CIVIL AVIATION
Outlook for advanced concepts in transport aircraft
[NASA-TM-81810] N80-23283
Mathematical model for the separation of gust and manoeuvre loads of civil aircraft
[FB-141(1979)] N80-23674
CLASSIFICATIONS
System requirements analysis for the Chemical Structure and Nomenclature System (CSNS)
[PB80-105216] N80-24207
CLASSIFIERS
Classification of multispectral remote sensing data
[ESA-TT-571] N80-23762
CLEAN ENERGY
Fossil energy program
[ORNL/TM-7144] N80-23828
CLEANING
Preliminary design report: New ideas for heliostat reflector cleaning systems
[SAND-79-8181] N80-23809
CLIMATE
Climatic changes from increased atmospheric carbon dioxide. Citations from the NTIS data base
[PB80-805427] N80-23953
CLIMATOLOGY
Laser communication climatology study
[AD-A081656] N80-23546
A time variable model of Earth's albedo --- for climatology studies and interpretation of satellite data
[NASA-CR-159259] N80-23935
Some statistical techniques for climatological data
[AD-A081490] N80-23942
Report of the Climate Data Management Workshop --- conferences
[PB80-128226] N80-23955
History of the Sun's luminosity, 0 to 460,000 BP, based on the geologic record in light of recent climate theory
[UCRL-80972-REV-2] N80-24244
CLINICAL MEDICINE
An experimental evaluation of selected rewarming therapies for the treatment of profound accidental hypothermia, part 2
[AD-A078292] N80-23978
CLOSING
Orbiter door closure tools N80-23498
CLOUD COVER
Laser communication climatology study
[AD-A081656] N80-23546
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Application explorer mission A: Heat capacity mapping mission
[E80-10107] N80-23734
A time variable model of Earth's albedo --- for climatology studies and interpretation of satellite data
[NASA-CR-159259] N80-23935
Environmental satellite imagery, April 1979
[PB80-130214] N80-23951
CLOUD PHYSICS
Conduct of cloud spectra measurements
[AD-A081127] N80-23914
Thundercloud electrification models in atmospheric electricity and meteorology
[NASA-CR-161441] N80-23932
Diurnal variations of coastal stratus
[AD-A080951] N80-23939
CLOUDS (METEOROLOGY)
Conduct of cloud spectra measurements
[AD-A081127] N80-23914
CMOS
Autoclave testing of plastic encapsulated 4001 CMOS integrated circuits
[AD-A081555] N80-23570
Latch-up control in CMOS integrated circuits
[SAND-79-1479C] N80-23583

COAL
Coal-shale interface detector
[NASA-CASE-MFS-23720-1] N80-23711
Development and testing of a microwave system to measure coal layer thickness up to 25 cm
[FE-8881-1] N80-23757
Environmental standards for coal conversion processes. Volume 1: Most stringent, federal, and selected state regulations
[PB80-126980] N80-23904
Dynamic fracture strength of oil shale and coal
[OUEL-1295/79] N80-23927
COAL GASIFICATION
Test and evaluate the TRI-GAS low-Btu coal gasification process
[FE-2798-66] N80-23484
Summary of the research and development effort on open-cycle coal-fired gas turbines
[ORNL/TM-6253] N80-23821
COAL LIQUEFACTION
Fossil energy program
[ORNL/TM-7144] N80-23828
COAL UTILIZATION
Fossil energy program
[ORNL/TM-7144] N80-23828
The chemical transformation of sulfur dioxide to sulfate in the plume of the coal-burning Keystone power plant N80-23873
COASTAL ECOLOGY
Earth resources data project
[E80-10092] N80-23719
Bioprocesses --- in the marine environment N80-23957
COASTAL WATER
LANDSAT's role in state coastal management programs --- New Jersey and Texas
[E80-10101] N80-23728
Coastal sedimentation N80-23960
COASTS
LANDSAT's role in state coastal management programs --- New Jersey and Texas
[E80-10101] N80-23728
Diurnal variations of coastal stratus
[AD-A080951] N80-23939
Recommended changes in meteorological measurement and prediction methods for coastal sites
[BNL-26840] N80-23946
COAXIAL CABLES
An analytical and experimental investigation of planar discontinuities in coaxial waveguides N80-23526
COBALT
Fatigue crack propagation in a directionally solidified cobalt-base eutectic N80-23426
COCKPIT SIMULATORS
Operations manual: Vertical Motion Simulator (VMS) 5.08
[NASA-TM-81180] N80-23295
COHERENT ELECTROMAGNETIC RADIATION
Extension for increased data collection of quasi-homogeneous sources, addendum
[AD-A081557] N80-23645
COHERENT RADAR
The Urbana coherent-scatter radar: Synthesis and first results
[NASA-CR-153186] N80-23531
COHERENT SCATTERING
Coherent Anti-Stokes Raman scattering at electronic resonance: Application to iodine
[ONERA-NT-1979-4] N80-23404
The Urbana coherent-scatter radar: Synthesis and first results
[NASA-CR-153186] N80-23531
COLD WORKING
Mechanical properties of cold-worked 5083 aluminum
[UCID-18179] N80-23437
COLLIMATION
ORNL 10-m small-angle X-ray scattering camera
[ORNL/TM-6342] N80-23630
COLLIMATORS
Radiation and shielding around beam absorbers
[INTERIKO-78/7] N80-24148
COLLISIONLESS PLASMAS
Plasma boundary collisionless absorption effects in the loading of RF conductors
[AD-A081115] N80-24167
Numerical treatment of linearized equations describing inhomogeneous collisionless plasmas
[LA-UR-79-2755] N80-24172
COLOR
Interpretation of LANDSAT digital data using a cubic color model based on relative energies
[E80-10119] N80-23745
COLORADO
Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
COLUMNS (PROCESS ENGINEERING)
The optimization air separation plants for combined cycle MHD-power plant applications
[NASA-TM-81510] N80-23778
COMBAT
Air combat maneuvering performance measurement
[AD-A077429] N80-23336
A discriminant analysis of pilot performance prediction and selection for air-to-air combat N80-23984
COMBINATORIAL ANALYSIS
On the computational complexity of branch and bound search strategies
[AD-A081608] N80-24051
Generating all maximal independent sets: NP-hardness and polynomial-time algorithms
[MC-BW-87/78] N80-24068
Vertex-critical subgraphs of Kneser-graphs
[MC-ZW-108/78] N80-24089
A lower bound for the length of partial transversals in a Latin square
[MC-ZW-109/78] N80-24090
Solution of two fractional packing problems of Lovász
[MC-ZW-110/78] N80-24091
Combinatorial graph embedding
[AD-A081247] N80-24106
COMBUSTIBLE FLOW
Turbulent transport phenomena --- experimental measurement techniques
[AGARD-AR-150] N80-23620
COMBUSTION
Turbopropulsion combustion technology assessment
[AD-A080748] N80-23323
Exploring new concepts for elucidating processes occurring in pyrotechnic flares and for generating aerosol dispersions
[AD-A080731] N80-23473
COMBUSTION CHAMBERS
Electric fuel nozzles for combustors
[SAN/1442-79/T1] N80-23660
The effect of catalyst length and downstream reactor distance on catalytic combustor performance
[NASA-TM-81475] N80-23779
COMBUSTION PHYSICS
Coherent Raman combustion diagnostics
[SAND-79-8807] N80-23401
Formation of prompt nitrogen oxides during combustion of hydrocarbons
[ESA-TT-579] N80-23411
COMBUSTION PRODUCTS
Coherent Raman combustion diagnostics
[SAND-79-8807] N80-23401
COMMERCE
Federal Rapublic of Germany: Estimates of future energy/GDP relationships
[ORAU/IEA(M)-79-22] N80-23841
COMMERCIAL AIRCRAFT
Design, development and implementation of an active control system for load alleviation for a commercial transport airplane
[AGARD-AR-683] N80-23331
COMMUNICATION CABLES
Measurement of interference-to-navigation/communication avionics from cable television (CATV) systems
[AD-A081430] N80-23530
COMMUNICATION EQUIPMENT
Communications-electronic intrasystem electromagnetic interference measurement technique and instrumentation
[AD-A081830] N80-23537
COMMUNICATION NETWORKS
Channels that cooperatively service a data stream and voice messages, 1
[AD-A081616] N80-23538
Channels that cooperatively service a data stream and voice messages. Part 2: Diffusion approximations
[AD-A081617] N80-23540
Basic studies for a new communication network. Part B: Mobile radio telephone
[BMFT-FB-T-79-06] N80-23552
COMMUNICATION SATELLITES
On the advanced power system configuration study
[TP-7753] N80-23355
A study of increased reliability and lifetimes for future communications satellites, volume 1
[GTS-790174-VOL-1] N80-23356
A study of increased reliability and lifetimes for future communications satellites, volume 2
[GTS-790173-VOL-2] N80-23357
Research on the applications of space technology
[NASA-CR-153184] N80-24213
COMPARISON
On the choice of variance for the log rank test
[AD-A080296] N80-24101
COMPILERS
Honeywell information systems MULTICS version 4.1
[PB80-126071] N80-24208
COMPLEMENTS (MATHEMATICS)
Equivalence of LCP and PLS --- linear complementarity and piecewise linear systems
[AD-A080890] N80-24016
COMPLETENESS
A sound and complete Hoare-like system for a fragment of PASCAL
[MC-IW-97/78] N80-24022
COMPLEX NUMBERS
Complex arithmetic in FORTRAN
[NPL-NACS-23/79] N80-24031
COMPLEXITY
Deterministic production planning: Algorithms and complexity
[MC-BW-93/78] N80-24116
COMPOSITE MATERIALS
Science base for materials processing: Selected topics --- conferences
[PB80-122948] N80-23369
Flight service evaluation of Kevlar-49 epoxy composite panels in wide-bodied commercial transport aircraft
[NASA-CR-159231] N80-23371
Fatigue characterization of composite materials
[AD-A081320] N80-23372
Definition and modeling of critical flaws in graphite fiber reinforced resin matrix composite materials
[AD-A080693] N80-23376
Rapid propagation of interface-flaws in composite bodies
[AD-A078813] N80-23377
Effective behavior of composite materials
[AD-A078466] N80-23378
Application of graphite/epoxy composites for the SPS-10 radar reflector
[AD-A077530] N80-23380
Thermal conductivity and diffusivity of engineering ceramics
[AD-A078540] N80-23465
Computer analysis of shells and composites
[AD-A081469] N80-23690
Analytical stress analysis of elastic composites with cracks
[UCRL-15109] N80-23696
Dynamic mechanical properties of fiber-reinforced composite materials N80-24251
Recent research in composite and sandwich plate dynamics N80-24252
COMPOSITE STRUCTURES
Rapid propagation of interface-flaws in composite bodies
[AD-A078813] N80-23377
COMPRESSED AIR
Application and design studies of compressed-air energy storage for solar applications
[CAES-7] N80-23788
Optimal design of compressed air energy storage systems
[CONF-791069-3] N80-23789
Parametric performance evaluation and technical assessment of adiabatic compressed air energy storage systems
[EPRI-EM-1188] N80-23796

Numerical analysis of temperature and flow effects in a dry, two-dimensional, porous-media reservoir used for compressed air energy storage
[PNL-3047] N80-23823

COMPRESSIBILITY EFFECTS

The harmonically oscillating body in subsonic flow: Effect of compressibility
[ESA-TT-584] N80-23270

COMPRESSOR BLADES

Investigation into compressor aeroelastic instabilities in a wind tunnel for a rectilinear cascade of blades
[PNR-90011] N80-23337

COMPRESSOR EFFICIENCY

Core compressor exit stage study, 2
[NASA-CR-159812] N80-23312

COMPRESSORS

Study and detail design of the engineering model of a vapor compressor to be used in space
[F/W-FO-1498] N80-23664

COMPUTER ASSISTED INSTRUCTION

Low-cost computer-aided instruction/computer-managed instruction CAI/CMI system: Feasibility study
[AD-A081072] N80-24014

Computer-assisted instruction in the context of the advanced instructional system. Part 1: Authoring support software
[AD-A081071] N80-24015

COMPUTER GRAPHICS

Interactive simulation of the progressive collapse of a building revisited
[TRITA-NA-7921] N80-23706

Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Sybsystem (RSIS): User's guide
[E80-10088] N80-23715

Operations manual for the LANDSAT Imagery, Verification and Extraction System (LIVES)
[E80-10090] N80-23717

Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Acceptance test procedures
[E80-10097] N80-23724

Agricultural scene understanding and supporting field research, volume 1
[E80-10113] N80-23740

Applications of digital display in photointerpretation and digital mapping
[AD-A081091] N80-23751

Digital screening and halftone techniques for raster processing
[AD-A081090] N80-23753

Seismic data catalog and associated graphical capabilities
[PNL-2693] N80-23918

Global program analysis in an interactive environment N80-24000

An interactive computer program for sizing spacecraft momentum storage devices
[NASA-TM-81798] N80-24002

A framework for the integration of graphics and pattern recognition
[MC-IW-96/78] N80-24021

COMPUTER NETWORKS

Environmental data for sites in the National Solar Data Network
[SOLAR/0010-79/05] N80-23833

A dynamically reconfigurable distributed computing system — integrating pipelining and parallel processing N80-23989

Interconnection network in multiple-processor systems
[AD-A080959] N80-23993

A SIMULA program for investigating a class of queueing networks
[FUB-40-1978] N80-24040

System requirements analysis for the Chemical Structure and Nomenclature System (CSNS)
[PB80-105216] N80-24207

How to gain access to information on science and technology for development from data bases via computer telecommunications
[PB80-133143] N80-24209

COMPUTER PROGRAMMING

Simple microcomputer interface to instruments with parallel decimal (BCD) outputs
[GEPP-397] N80-23997

Non-numerical applications of computer programming in the construction of problem oriented languages
[AD-A081673] N80-24009

Concurrent manipulation of binary trees, revision
[AD-A081443] N80-24012

An analysis of software design methodologies
[AD-A081319] N80-24013

Task reduction systems
[MC-IW-95/78] N80-24020

Logical investigations on PTQ arising from programming requirements
[MC-ZW-117/78] N80-24025

The study of reliability of real-time software for space missions, volume 2
[ESA-CR(P)-1270-VOL-2] N80-24028

The study of reliability of real-time software for space missions, volume 3
[REPT-7T40423/MEG/JCR-VOL-3] N80-24029

Some statistics on ALGOL 68 programs
[MC-IW-109/79] N80-24032

Copositive matrices and definiteness of quadratic forms subject to homogeneous linear inequality constraints
[CSIR-TWISK-89] N80-24047

Two papers on graph embedding problems
[AD-A081449] N80-24056

COMPUTER PROGRAMS

Numerical flow field program for aerodynamic heating analysis. Volume 1: Equations and results
[AD-A081471] N80-23255

Easy-ACIS dynamic analysis. User's manual
[AD-A081160] N80-23258

Numerical flow field program for aerodynamic heating analysis. Volume 2: User's manual
[AD-A081472] N80-23260

Global Positioning Systems (GPS) High Dynamic User Equipment (HDUE). Volume 2: Set description
[AD-A076480] N80-23290

Global Positioning System (GPS) High Dynamic User Equipment (HDUE). Volume 3: Set description
[AD-A076481] N80-23291

Functional and operational advances in the AFGL rocket trajectory system-I
[AD-A081447] N80-23349

HEROP: A computer program for the thermodynamic and thermophysical properties of helium, third edition
[OUEL-1289/79] N80-23413

Computer programs for reducing mass spectra data from GC/MS systems
[PB80-133119] N80-23417

Study and development of a computer program for analysis of SAR planar array antennas
[S-110-02] N80-23555

AN/TPQ-37 transmitter test bed
[AD-A081591] N80-23576

Computer programs for calculating partially cavitating blunt trailing edged cascade flows in nonlinear theory
[AD-A081832] N80-23610

Computer programs: Shock and vibration isolation N80-23671

Computer analysis of shells and composites
[AD-A081469] N80-23690

Technical manual: Primary data reduction programs for the Eclipse S-200/230 shock and vibration measurement systems
[SAND-79-8054] N80-23698

Interactive simulation of the progressive collapse of a building revisited
[TRITA-NA-7921] N80-23706

Texas Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Unival software user's guide
[E80-10096] N80-23723

Processing techniques development, volume 3. Part 2: Data preprocessing and information extraction techniques
[E80-10115] N80-23742

Thermal fracture effects in geothermal energy extraction --- computer programs
[LA-7963] N80-23795

The physics of the photodeposition phase of the NRL master code for the disturbed E and F regions
[AD-A081776] N80-23916

Development of a three-dimensional seismic data acquisition and processing system
[BMFT-FB-T-79-22] N80-23921

Techniques for program verification N80-24001

Complexity as a factor of quality and cost in large scale software development
[AD-A081604] N80-24010

Using executive assertions for testing
[AD-A081488] N80-24011

Computer-assisted instruction in the context of the advanced instructional system. Part 1: Authoring support software
[AD-A081071] N80-24015

Modern methods of multiple spectral density estimation
[AD-A081172] N80-24058

Bivariate normal, conditional and rectangular probabilities: A computer program with applications
[NASA-TM-81350] N80-24099

Intermittent/transient faults in computer systems: Executive summary
[NASA-CR-159229] N80-24114

Backscattering programs for spherical targets
[AD-A081094] N80-24131

Axisymmetric instability in a noncircular Tokamak: Experiment and theory
[COO-2387-116] N80-24175

ANTIC: A code for calculation of neutral transport in cylindrical plasmas
[SAI-79-1056-LJ] N80-24180

System requirements analysis for the Chemical Structure and Nomenclature System (CSNS)
[PB80-105216] N80-24207

Improved coordinates of features in the vicinity of the Viking lander site on Mars
[NASA-CR-153193] N80-24236

Application of advanced computational procedures for modeling solar-wind interactions with Venus: Theory and computer code
[NASA-CR-3267] N80-24240

COMPUTER SYSTEMS DESIGN

Software impact of selected en route ATC computer replacement strategies
[AD-A081478] N80-23286

The ZOG approach to man-machine communication
[AD-A081088] N80-23535

An analysis of software design methodologies
[AD-A081319] N80-24013

A sound and complete Hoare-like system for a fragment of PASCAL
[MC-IW-97/78] N80-24022

A finite state lexical analyzer for the standard hardware representation of ALGOL 68
[MC-IW-98/78] N80-24023

Intermittent/transient faults in computer systems: Executive summary
[NASA-CR-159229] N80-24114

COMPUTER SYSTEMS PROGRAMS

Software impact of selected en route ATC computer replacement strategies
[AD-A081478] N80-23286

Users manual for the LANDSAT Imagery Verification and Extraction System (LIVES)
[E80-10091] N80-23718

Atlantis 2 cruise 102 moored and shipboard surface meteorological measurements during JASIN 1978
[AD-A080732] N80-23938

Recovery from soft errors in triplicated computer systems operating in lock-step
[PB80-126931] N80-23999

The study of real-time software on space missions, volume 1
[REPT-7T40423/MEG/JCR-VOL-1] N80-24027

COMPUTER TECHNIQUES

Computer programs: Shock and vibration isolation N80-23671

Environmental assessment methodology: Solar power plant applications. Volume 2: Industrial implications and secondary-impact methodology
[EPRI-ER-1070-VOL-2] N80-23786

Magnetic fusion energy and computers: The role of computing in magnetic fusion energy research and development
[DOE/ER-0033] N80-23838

Computations concerning the conjecture of Mertens
[MC-NW-64/78] N80-24079

Computerized method for the generation of molecular transmittance functions in the infrared region
[AD-A081789] N80-24139

Initial conceptualization and characterization of a Navy automated publishing, volume 2
[AD-A080479] N80-24203

COMPUTERIZED DESIGN
Design of special-purpose VLSI chips: Example and opinions
[AD-A081451] N80-23567
Characterization of digital filters used in Sandia Laboratories Test Data Analysis Division
[SAND-79-1230] N80-23582
An interactive computer program for sizing spacecraft momentum storage devices
[NASA-TM-81798] N80-24002
Automatic factorization of generalized upper bounds in large scale optimization models
[AD-A081614] N80-24017

COMPUTERIZED SIMULATION
Easy-ACIS dynamic analysis. User's manual
[AD-A081160] N80-23258
A primitive variable computer model for combustion within solid fuel ramjets
[AD-A081081] N80-23319
A review of representation functions for probability of detection
[AD-A081734] N80-23545
A calculation method for convective heat and mass transfer in multiply-slotted film-cooling applications
[AD-A081641] N80-23609
SOLPOND: A simulation program for salinity gradient solar ponds
[SERI/TP-351-559] N80-23856
Developing and upgrading of solar system thermal energy storage simulation models
[BCS-40252] N80-23858
A SIMULA program for investigating a class of queueing networks
[FUB-40-1978] N80-24040
The Roberson/Wittenburg formalism and the package MULTIBODY for computer simulations of multibody systems
[ESA-TT-557] N80-24097
Analysis of multimode fiber couplers, tapers and mode converters
[AD-A081669] N80-24154
Ergodic orbits in particle simulations of strong ion rings
[AD-A081391] N80-24168
Velocity distribution in a pinched beam
[UCID-18303] N80-24177
A computer simulation of organizational decision-making
[AD-A081600] N80-24202

COMPUTERS
Global Positioning Systems (GPS) High Dynamic User Equipment (HDUE). Volume 2: Set description
[AD-A076480] N80-23290
Global Positioning System (GPS) High Dynamic User Equipment (HDUE). Volume 3: Set description
[AD-A076481] N80-23291
Computer science and technology: Selection of data entry equipment
[PB80-144322] N80-23998

CONCENTRATION (COMPOSITION)
Analysis of high sulfate concentrations in greater New York City air
[PB80-128515] N80-23906

CONCENTRATORS
Development of a solar thermal receiver for high temperature applications
[SERI/TP-333-485] N80-23800
Low-cost mirror concentrator based on double-walled metallized, turbular films
[ALO-4227-12] N80-23811

CONCRETES
Tensile crack exposure tests. Report 3: Laboratory evaluation of series A beams with results from 1951 to 1975
[AD-A081302] N80-23692

CONDENSATES
Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation
[LBL-9811] N80-24142

CONFERENCES
Science base for materials processing: Selected topics --- conferences
[PB80-122948] N80-23369
Proceedings of the 14th Aerospace Mechanisms Symposium
[NASA-CP-2127] N80-23495
Role of Temperate Zone Forests in the World Carbon Cycle: Problem definition and Research Needs --- conferences
[DOE/ET/10040-1] N80-23883
Report of the Climate Data Management Workshop --- conferences
[PB80-128226] N80-23955
Remote Sensing and Problems of the Hydrosphere. A Focus for Future Research --- conferences
[NASA-CP-2132] N80-23956
Proceedings of the Workshop on Electrical and Biological Effects Related to HYDC Transmission
[PNL-3121] N80-23979

CONGRESSIONAL REPORTS
National Aeronautics and Space Administration Authorization Act, 1981
[S-96-719] N80-24210

CONIFERS
The application of remote sensing technology to the solution of problems in the management of resources in Indiana --- pheasant habitats in Benton County, soil mapping in Jasper County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23738

CONNECTORS
Natural convection heat transfer from an external receiver
[SAND-78-8276] N80-23612

CONSTANTS
Application of laser-induced fluorescence for measuring reaction rate constants in H-N-C-O systems
[MPIS-13/1979] N80-23406
Gladstone-Dale constant for CF4 --- experimental design
[NASA-TM-80228] N80-24151

CONSTITUTIVE EQUATIONS
Some comments on the endochronic theory of plasticity
[AD-A081825] N80-23689

CONTACT RESISTANCE
Significance of thermal contact resistance in two-layer thermal-barrier-coated turbine vanes
[NASA-TM-81483] N80-23310

CONTAMINATION
The use of indigodisodiumdisulfonate to combat molds in ozone reagents
[IG-TNO-G-861] N80-23408

CONTINUITY (MATHEMATICS)
On a sufficient condition for the existence of G-compactifications
[MC-ZW-120/78] N80-24122

CONTINUOUS WAVE LASERS
Inhomogeneous broadening effects in CW chemical lasers
[AD-A077319] N80-23435
Intracavity absorber effects in a CW dye laser
[COO-4448-2] N80-23647
Evaluation of basic laser welding capabilities
[AD-A077575] N80-23659

CONTROL
Optimum optical structures for active control --- structural analysis of a mirror system using NASTRAN
[AD-A080934] N80-24157

CONTROL MOMENT GYROSCOPES
An interactive computer program for sizing spacecraft momentum storage devices
[NASA-TM-81798] N80-24002

CONTROL SURFACES
A study of panel loads and centers of pressure of three different cruciform aft-tail control surfaces of a wingless missile from Mach 1.60 to 3.70
[NASA-TM-81787] N80-23251

CONTROL THEORY
Theory of disturbance-utilizing control with application to missile intercept problems
[AD-A081110] N80-23329
Aegis spy-1 radar 5-v/50-a switching-mode power supply stability analysis: A stability analysis employing state-space averaging techniques for converter modeling
[AD-A080449] N80-23532
Design of stochastic discrete-time linear optimal regulator
[OUEL-1288/79] N80-23589
Multiple microcomputer control algorithm
[AD-A080735] N80-23992
A random sampler of dynamic programming applications in signal processing and control
[AD-A081485] N80-24007
System optimization by periodic control
[AD-A080295] N80-24034
On optimistic methods for concurrency control
[AD-A081452] N80-24037
The M/G/1 queue with instantaneous Bernoulli feedback
[AD-A081256] N80-24038

CONTROL VALVES
Quartz ball value
[NASA-CASE-NPO-14473-1] N80-23654

CONTROLLABILITY
Precision controllability of the YF-17 airplane
[NASA-TP-1677] N80-23327

CONTROLLED ATMOSPHERES
Ice crystal growth in a dynamic thermal diffusion chamber
[NASA-TP-1651] N80-23934

CONTROLLERS
Investigations of the design of active vibration isolation systems for helicopters with rigid and elastic modeling of the fuselage
[ESA-TT-556] N80-23300

CONVECTIVE FLOW
Thermal fracture effects in geothermal energy extraction --- computer programs
[LA-7963] N80-23795

CONVECTIVE HEAT TRANSFER
Modeling of coupled heat transfer by radiation and convection: Application to Spacelab short module
[ESA-STM-214] N80-23361
A calculation method for convective heat and mass transfer in multiply-slotted film-cooling applications
[AD-A081641] N80-23609

CONVERGENCE
Non-stationary Markov decision problems with converging parameters
[MC-BW-90/78] N80-24070
The strength of nonstationary iteration
[AD-A081450] N80-24120

CONVEXITY
Expected number of vertices of a random convex polytope. I: Integral formula and asymptotic bounds
[AD-A080191] N80-24048
Algorithms for testing convexity of digital polygons
[AD-A081476] N80-24057
Locating an isolated global minimizer of a constrained nonconvex program
[AD-A080180] N80-24119

CONVOLUTION INTEGRALS
Jacobi functions: The addition formula and the positivity of the dual convolution structure
[MC-TW-177/78] N80-24085

COORDINATE TRANSFORMATIONS
Universal transverse Mercator grid tables for latitudes 0-80 degrees Clarke 1866 spheroid (meters). Volume 2: Transformation of coordinates from grid to geographic
[PB80-140411] N80-23763

COPPER
Investigations into the grain refinement of copper
N80-23420

COPPER ALLOYS
Stress corrosion characteristics of Al-Zn-Mg alloys with copper additions N80-23421

COPPER OXIDES
Methanol and methyl fuel catalysts --- CuO/ZnO catalysts
[FE-3177-3] N80-23482

CORAL REEFS
Global geochemical problems N80-23958

CORN
Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720
Agricultural soil moisture experiment: 1978 Colby (Kansas) data catalog and documentation --- Thomas County, Kansas
[E80-10098] N80-23725
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Applicability of selected wheat remote sensing technology to corn and soybeans
[E80-10112] N80-23739

Agricultural scene understanding and supporting field research, volume 1
[E80-10113] N80-23740
Processing techniques development, volume 2. Part 1: Crop inventory techniques --- Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

CORONA BOREALIS CONSTELLATION
Pulsation of high luminosity helium stars
[LA-UR-79-2785] N80-24223

CORRECTION
Shuttle program: Computing atmospheric scale height for refraction corrections
[NASA-TM-81059] N80-23911

CORROSION PREVENTION
Materials evaluation. Part 2: Development of corrosion inhibitors
[AD-A080905] N80-23434
Determination of the effect of composition, structure and electrochemical mass transport properties on adhesion and corrosion inhibition of paint films
[AD-A080960] N80-23578

CORROSION TESTS
Stress corrosion characteristics of Al-Zn-Mg alloys with copper additions N80-23421

COSMOLOGY
Cosmology: Citations from the NTIS data base
[PB80-804818] N80-24231

COST ANALYSIS
An algorithm for average costs denumerable state semi-Markov decision problems with applications to controlled production and queueing systems
[MC-BW-94/78] N80-24039
Denumerables state semi-Markov decision processes with unbounded costs, average cost criterion
[MC-BW-92/78] N80-24071
Deterministic production planning: Algorithms and complexity
[MC-BW-93/78] N80-24116

COST REDUCTION
Spacecraft radiators for advanced mission requirements
[NASA-CR-160589] N80-23362

COTTON
Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

COUETTE FLOW
Stability of modulated rotating fluids --- Galerkin method N80-23595

COUPLED MODES
Vehicle-guideway interaction problems
N80-24255

CRACK INITIATION
Practical implementation of the double linear damage rule and damage curve approach for treating cumulative fatigue damage
[NASA-TM-81517] N80-23684

CRACK PROPAGATION
Rapid propagation of interface-flaws in composite bodies
[AD-A078813] N80-23377
Fatigue crack propagation in a directionally solidified cobalt-base eutectic N80-23426
Gust severity effects on fatigue crack propagation in aluminum alloy sheet materials
[NLR-MP-78041-U] N80-23449
Visualization of impact damage of composite plates by means of the Moire technique
[NASA-CR-159261] N80-23679
Evaluation of the round compact specimen for fatigue-crack growth rate testing
[HEDL-SA-1810] N80-23699

CRACKING (FRACTURING)
Behavior of deep flaws in a thick-wall cylinder under thermal shock loading
[CONF-791123-3] N80-23697

CRACKS
Tensile crack exposure tests. Report 3: Laboratory evaluation of series A beams with results from 1951 to 1975
[AD-A081302] N80-23692
Analytical stress analysis of elastic composites with cracks
[UCRL-15109] N80-23696
Thermal fracture effects in geothermal energy extraction --- computer programs
[LA-7963] N80-23795

CRATERING
Studies of impact cratering processes N80-24233

CREEP ANALYSIS
Implicit strain-hardening formulation for creep analysis
[K/CSD/TM-30] N80-23702

CREEP TESTS
Creep-rupture behavior of 2-1/4Cr-1 Mo steel, Alloy 800H and Hastelloy Alloy X in a simulated HTGR helium environment
[GA-A-15572] N80-23440

CROP GROWTH
Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720
Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721

CROP IDENTIFICATION
Evaluation of several schemes for classification of remotely sensed data: Their parameters and performance --- Foster County, North Dakota; Grant County, Kansas; Iroquois County, Illinois, Tippecanoe County, Indiana; and Pottawattamie and Shelby Counties, Iowa
[E80-10105] N80-23732
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744

CROP INVENTORIES
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Sampling for area estimation: A comparison of full-frame sampling with the sample segment approach
[E80-10104] N80-23731
Applicability of selected wheat remote sensing technology to corn and soybeans
[E80-10112] N80-23739
Processing techniques development, volume 2. Part 1: Crop inventory techniques --- Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741
Composition and assembly of a spectral data base for transition year spring wheat blind sites --- North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

CROP VIGOR
Agricultural scene understanding and supporting field research, volume 1
[E80-10113] N80-23740

CRYOGENIC EQUIPMENT
Thermal and cryotechnical definition study on minicryogenerator system for space application (SQUID magnetometer) --- Spacelab payload
[BMFT-FB-W-79-01] N80-23586
Cryogenic cooling study for the advanced limb scanner
[NASA-CR-159250] N80-23621
Fabrication and characterization of cryogenic targets for inertial confinement fusion
[UCRL-15113] N80-24170

CRYOGENIC WIND TUNNELS
Cryogenic wind tunnels: A selected, annotated bibliography
[NASA-TM-80168] N80-23333

CRYSTAL DEFECTS
Improvement in GaAs device yield and performance through substrate defect gettering
[AD-A081344] N80-24189

CRYSTAL DISLOCATIONS
The effects of deformation mode on the behavior of Ti-28%V and Ti-32%V alloys N80-23423

CRYSTAL GROWTH
Ice crystal growth in a dynamic thermal diffusion chamber
[NASA-TP-1651] N80-23934

CRYSTAL OSCILLATORS
Passive intrusion detection system
[NASA-CASE-NPO-13804-1] N80-23559
Tactical miniature crystal oscillator
[AD-A080769] N80-23572
Research on the pertinent parameters of a quartz oscillator
[ONERA-NT-1979-10] N80-23588

CRYSTAL SURFACES
A surface analysis study of carbon monoxide and hydrogen absorption and desorption of Ni(3) crystals --- catalytic reactivity N80-23425

CRYSTALLOGRAPHY
Crystallography in fusion-weld-metal solidification mechanics N80-23429

CUMULATIVE DAMAGE
Practical implementation of the double linear damage rule and damage curve approach for treating cumulative fatigue damage
[NASA-TM-81517] N80-23684

CUMULONIMBUS CLOUDS
Thundercloud electrification models in atmospheric electricity and meteorology
[NASA-CR-161441] N80-23932

CURRENT CONVERTERS (AC TO DC)
Development of current converters for switching and regulating tasks in energy technology
[BMFT-FB-T-79-12] N80-23585

CURRENT DENSITY
Current generation with low-frequency waves
[PPPL-1624] N80-23581
Vortices in superconducting films
[ISM-258] N80-24195

CURVATURE
On Goertler instability
[AD-A081255] N80-23602

CYCLIC HYDROCARBONS
Methods for the isolation and identification of polycyclic aromatic hydrocarbons found in complex mixtures and their possible toxicity by means of bioassay techniques N80-23398

CYLINDRICAL BODIES
Analysis of experiments on the effects of jet plumes on pressure distribution over a cylindrical afterbody at transonic speeds
[AD-A081647] N80-23259
A new method of roundness measurement by capacitive detectors
[ONERA-NT-1979-9] N80-23523
Hydroelastic oscillations of smooth and rough cylinders in harmonic flow
[AD-A081760] N80-23606
An analysis of the static and dynamic instability of thick cylinders
[OUEL-1292/79] N80-23709

CYLINDRICAL SHELLS
Behavior of deep flaws in a thick-wall cylinder under thermal shock loading
[CONF-791123-3] N80-23697
Normal mode acoustic scattering from elastic cylindrical shells N80-24127

D

DATA ACQUISITION
Wind tunnel investigation of an all flush orifice air data system for a large subsonic aircraft --- conducted in a Langley 8 foot transonic pressure tunnel
[NASA-TP-1642] N80-23304

Extension for increased data collection of quasi-homogeneous sources, addendum
[AD-A081557] N80-23645
Development of a three-dimensional seismic data acquisition and processing system
[BMFT-FB-T-79-22] N80-23921
Planning of automated data acquisition and process control systems (ADACS)
[AD-A081043] N80-23994

DATA BASES
Aqueous solutions database to high temperatures and pressures: NaCl solutions
[LBL-9621] N80-23399
Users manual for the LANDSAT Imagery Verification and Extraction System (LIVES)
[E80-10091] N80-23718
Integrated use of LANDSAT data for state resource management — Arizona, Georgia, North Dakota, and Texas
[E80-10095] N80-23722
Agricultural scene understanding and supporting field research, volume 1
[E80-10113] N80-23740
Computer processing support, volume 4
[E80-10116] N80-23743
Composition and assembly of a spectral data base for transition year spring wheat blind sites — North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747
Seismic data catalog and associated graphical capabilities
[PNL-2893] N80-23918
On optimistic methods for concurrency control
[AD-A081452] N80-24037
System requirements analysis for the Chemical Structure and Nomenclature System (CSNS)
[PB80-105216] N80-24207
How to gain access to information on science and technology for development from data bases via computer telecommunications
[PB80-133143] N80-24209

DATA LINKS
Signal level distributions and fade event analyses for a 5 GHz microwave link across the English Channel
[PB80-129398] N80-23557

DATA MANAGEMENT
E-3A EMP evaluation program
[AD-A081725] N80-23536
Composition and assembly of a spectral data base for transition year spring wheat blind sites — North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747
Report of the Climate Data Management Workshop — conferences
[PB80-128226] N80-23955
Global program analysis in an interactive environment N80-24000
DTIC cataloging guidelines
[AD-A080800] N80-24204

DATA PROCESSING
Channels that cooperatively service a data stream and voice messages, 1
[AD-A081616] N80-23538
Channels that cooperatively service a data stream and voice messages. Part 2: Diffusion approximations
[AD-A081617] N80-23540
Characterization of digital filters used in Sandia Laboratories Test Data Analysis Division
[SAND-79-1230] N80-23582
Processing techniques development, volume 3. Part 2: Data preprocessing and information extraction techniques
[E80-10115] N80-23742
Computer processing support, volume 4
[E80-10116] N80-23743
Interpretation of LANDSAT digital data using a cubic color model based on relative energies
[E80-10119] N80-23745
SAROAD: Storage and Retrieval of Aerometric Data) information
[PB80-133838] N80-23903
Analysis of high sulfate concentrations in greater New York City air
[PB80-128515] N80-23906
Data processing systems for accelerometer experiments on air force satellites
[AD-A080460] N80-23913
Filtering meteorological flight data
[DFVLR-MITT-79-19] N80-23949
A discriminant analysis of pilot performance prediction and selection for air-to-air combat N80-23984
Planning of automated data acquisition and process control systems (ADACS)
[AD-A081043] N80-23994
Transforming static data structures to dynamic structures
[AD-A081438] N80-24008
Regression analysis for mixed cross-section and time-series data with references to some incomplete observations techniques
[MC-SW-61/78] N80-24083

DATA RECORDING
Data structures for calculating flows in storm sewer systems
[NPL-NACS-20/79] N80-23617

DATA REDUCTION
Technical manual: Primary data reduction programs for the Eclipse S-200/230 shock and vibration measurement systems
[SAND-79-8054] N80-23698
Development of a winter wheat adjustable crop calendar model — Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
A discriminant analysis of pilot performance prediction and selection for air-to-air combat N80-23984
Regression analysis for mixed cross-section and time-series data with references to some incomplete observations techniques
[MC-SW-61/78] N80-24083
Maximum likelihood estimation for an autoregressive process with missing observations
[AD-A081251] N80-24107

DATA SAMPLING
Sampling for area estimation: A comparison of full-frame sampling with the sample segment approach
[E80-10104] N80-23731
Digital compensators for sampled systems and minimum time control
[ESA-TT-607] N80-24041

DATA STORAGE
Optimum digital data storage on magnetic tape
[AD-A081049] N80-23996

DATA SYSTEMS
Environmental data for sites in the National Solar Data Network
[SOLAR/0010-79/05] N80-23833
SAROAD: Storage and Retrieval of Aerometric Data) information
[PB80-133838] N80-23903
Computer science and technology: Selection of data entry equipment
[PB80-144322] N80-23996

DATA TRANSMISSION
Analysis of multimode fiber couplers, tapers and mode converters
[AD-A081669] N80-24154

DECISION MAKING
Clarification process: Resolution of decision-problem conditions
[NASA-TM-81193] N80-23985
Matrix management for aerospace 2000
[NASA-TM-81509] N80-24200
A computer simulation of organizational decision-making
[AD-A081600] N80-24202

DECISION THEORY
Decision analysis of Advanced Scout Helicopter candidates
[AD-A081483] N80-23298
Some statistical techniques for climatological data
[AD-A081490] N80-23942
An algorithm for average costs denumerable state semi-Markov decision problems with applications to controlled production and queueing systems
[MC-BW-94/78] N80-24039
Non-stationary Markov decision problems with converging parameters
[MC-BW-90/78] N80-24070
Denumerables state semi-Markov decision processes with unbounded costs, average cost criterion
[MC-BW-92/78] N80-24071

DECONTAMINATION
Chemical decontamination of metals — treatment with a cerium-nitric acid solution
[HEDL-SA-1880] N80-23442

DEFECTS
Improving a real time acoustical holographic system for flaw detection
[AD-A080918] N80-23625
Non-destructive evaluation of defects in structural materials using long-wavelength neutrons
[AD-A081097] N80-23665
Behavior of deep flaws in a thick-wall cylinder under thermal shock loading
[CONF-791123-3] N80-23897

DEGRADATION
Solar photovoltaic project: Materials, and testing activities
[COO-4094-60] N80-23655

DELAWARE BAY (US)
LANDSAT's role in state coastal management programs — New Jersey and Texas
[E80-10101] N80-23728

DELTA WINGS
Leeward flow over delta wings at supersonic speeds
[NASA-TM-81187] N80-23250
Lee side flow for slender delta wings of finite thickness
[NASA-TM-75753] N80-23253

DELTAS
Voorne-Putten: A landscape-ecological survey — Rhine delta, Netherlands
[REPT-4] N80-23761

DENSITY MEASUREMENT
Density variation in the electron-hole liquid in stressed germanium and silicon
[LBL-8786] N80-24192

DEPLOYMENT
Mechanisms to deploy the two-stage IUS from the shuttle cargo bay N80-23496
Centrifugal regulator for control of deployment rates of deployable elements N80-23504

DESALINIZATION
Development of a composite reverse osmosis membrane for single pass seawater desalination
[PB80-124852] N80-23414
Development of low pressure brackish water reverse osmosis membranes
[PB80-126204] N80-23415
Development of a rotary high pressure displacement pump for reversed osmosis systems for seawater desalination
[BMFT-FB-M-78-08] N80-23663

DESIGN ANALYSIS
Investigations of the design of active vibration isolation systems for helicopters with rigid and elastic modeling of the fuselage
[ESA-TT-556] N80-23300
Bayesian concepts for reliability and statistical decision theory for structural design N80-23493
Design, stability and performance of two-dimensional recursive digital filters N80-23562
Magnetic bearing support study for a 10 kW-hr energy storage flywheel
[SAND-79-7025] N80-23661

DETECTION
Summaries of some reports of 1978 concerning results of field experiments for visibility
[DFVLR-MITT-79-11] N80-23933

DETONATION WAVES
Applications of random-choice method to problems in shock and detonation-wave dynamics
[AD-A081304] N80-23603

DEUTERIDES
Hydrogen storage materials research and development work at Brookhaven National Laboratory
[BNL-26813] N80-23478

DIELECTRIC PERMEABILITY
Electromagnetic penetration through a slot in a screen covered by a dielectric slab N80-23527

DIELECTRIC PROPERTIES
Theoretical and experimental studies on the dielectric and optical properties of fluids under high pressure N80-23389

DIFFERENTIAL EQUATIONS
A numerical method to integrate Stiff systems of ordinary differential equations
[AD-A080998] N80-24063

Global error estimation for stiff ODEs.
[SAND-79-1587] N80-24065
On the stability of multistep formulas for systems of Volterra integro-differential equations
[MC-NW-63/78] N80-24078

DIFFUSION WELDING
Elastic constants for superplastically formed/diffusion-bonded corrugated sandwich core
[NASA-TP-1562] N80-23677

DIFFUSIVITY
Diffusionless transformations in titanium-nickel
N80-23427

DIGITAL COMMAND SYSTEMS
Digital compensators for sampled systems and minimum time control
[ESA-TT-607] N80-24041

DIGITAL DATA
Interpretation of LANDSAT digital data using a cubic color model based on relative energies
[E80-10119] N80-23745

DIGITAL FILTERS
Design, stability and performance of two-dimensional recursive digital filters N80-23562
Characterization of digital filters used in Sandia Laboratories Test Data Analysis Division
[SAND-79-1230] N80-23582
Wiener-Hopf approaches to regulator, filter/observer, and optical-coupler problems
[AD-A081489] N80-24049

DIGITAL SIMULATION
Digital simulation of dynamic processes in radiometer systems — microwave radiometers
[NASA-CR-159266] N80-23583
Algorithms for testing convexity of digital polygons
[AD-A081476] N80-24057

DIGITAL SYSTEMS
Digital screening and halftone techniques for raster processing
[AD-A081090] N80-23753
Optimum digital data storage on magnetic tape
[AD-A081049] N80-23996

DIGITAL TECHNIQUES
Operations manual for the LANDSAT Imagery, Verification and Extraction System (LIVES)
[E80-10090] N80-23717
Automation in photogrammetry — use of digital image processing technology
[AD-A081562] N80-23750
Applications of digital display in photointerpretation and digital mapping
[AD-A081091] N80-23751
Classification of multispectral remote sensing data
[ESA-TT-571] N80-23762

DIGITAL TO ANALOG CONVERTERS
Noncontact, laser interferometer sweep gage
[Y-2190] N80-23631

DILATOMETRY
Development of a laser interferometric dilatometer
[SAND-79-1714C] N80-23650

DILUTION
An investigation into the initial mixing and dilution of identical plumes from multiple stack configurations
[BU-233] N80-23902

DIMENSIONAL STABILITY
Computer analysis of shells and composites
[AD-A081469] N80-23690

DIOPHANTINE EQUATION
Computations concerning the conjecture of Mertens
[MC-NW-64/78] N80-24079
On the Diophantine equation 1k + 2k + ... + xk + R(x) = yz
[MC-ZW-113/78] N80-24094

DIRECT CURRENT
Proceedings of the Workshop on Electrical and Biological Effects Related to HVDC Transmission
[PNL-3121] N80-23979

DIRECTIONAL ANTENNAS
The design and application of an antenna positioner mechanism for Intelsat-5 series communication satellite N80-23521

DIRECTIONAL SOLIDIFICATION (CRYSTALS)
Preparation of monotectic alloys having a controlled microstructure by directional solidification under dopant-induced interface breakdown
[NASA-CASE-MFS-23816-1] N80-23419
Directional solidification of manganese-bismuth/bismuth alloys N80-23422
Analysis of possible improvements of alloys due to directional eutectic solidification in zero gravity conditions
[ESA-TT-575] N80-23447

DISCONTINUITY
An analytical and experimental investigation of planar discontinuities in coaxial waveguides
N80-23526

DISCRETE FUNCTIONS
One-step splitting methods formulated for semi-discrete parabolic equations
[MC-NW-55/78] N80-24073
Semi-discretization methods for partial differential equations on nonrectangular grids
[MC-NW-56/78] N80-24074
Inequalities in discrete distributions
[MC-SW-56/78] N80-24080
The method of n rankings when the underlying distributions are discrete
[CSIR-TWISK-108] N80-24100
Transformation of a discrete distribution to near normality
[AD-A080886] N80-24104

DISLOCATIONS (MATERIALS)
Superposition of alloy hardening, strain hardening, and dynamic recovery
[CONF-790801-6] N80-23436

DISPERSIONS
Atmospheric dispersion of high velocity jets
[AD-A081612] N80-23321

DISPLACEMENT MEASUREMENT
Investigation of tidal displacements of the Earth's surface by laser ranging to GEOS-3
[NASA-CR-156863] N80-23908

DISPLAY DEVICES
Flight test evaluation of airborne tire pressure indicating systems
[AD-A081598] N80-23305
Visually Coupled System: Computer Generated Imagery (VCS-CGI) engineering interface
[AD-A080931] N80-23306
NAVAIRDEVCEN dynamic flight simulator design and multipurpose crew station concept design and development plan
[AD-A081982] N80-23335
Technologies of imaging for communication terminals
[BMFT-FB-T-79-38] N80-23554
Operations manual for the LANDSAT Imagery, Verification and Extraction System (LIVES)
[E80-10090] N80-23717
Applications of digital display in photointerpretation and digital mapping
[AD-A081091] N80-23751
Liquid crystal displays of high reliability
[BMFT-FB-T-79-17] N80-24197

DISSOCIATION
Solar photo rate coefficients — monatomic gases and metastable states
[LA-8085-MS] N80-24243

DISTANCE
Summaries of some reports of 1978 concerning results of field experiments for visibility
[DFVLR-MITT-79-11] N80-23983
Binary codes with minimum distance four
[MC-ZW-112/78] N80-24093
Field manual to determine detection or recognition range of a FLIR sensor
[AD-A081324] N80-24156

DISTANCE MEASURING EQUIPMENT
A flight investigation of system accuracies and operational capabilities of a general aviation/air transport area navigation system (RNAV)
[AD-A081646] N80-23288

DISTRIBUTION FUNCTIONS
Inequalities in discrete distributions
[MC-SW-56/78] N80-24080
Nonuniformity of the convergence of location estimators
[MC-SW-60/78] N80-24082
The method of n rankings when the underlying distributions are discrete
[CSIR-TWISK-108] N80-24100

DIURNAL VARIATIONS
A time variable model of Earth's albedo — for climatology studies and interpretation of satellite data
[NASA-CR-159259] N80-23935
Diurnal variations of coastal stratus
[AD-A080951] N80-23939
Hawaii wind power survey: Fixed station data
[UHMET-79-15] N80-23948

DOCUMENTATION
The Shock and Vibration Digest, volume 11, no.8
[AD-A073239] N80-24247

DOMESTIC ENERGY
Research and development of an air-cycle heat-pump water heater
[ORNL/SUB-7226/1] N80-23850

DOMESTIC SATELLITE COMMUNICATIONS SYSTEMS
Research on the applications of space technology
[NASA-CR-153184] N80-24213

DOORS
Orbiter door closure tools N80-23498

DOPPLER EFFECT
Investigation of velocity field about a two dimensional plexiglass ogival foil using the laser doppler anemometer
[AD-A081765] N80-23639

DOPPLER RADAR
Dual-frequency Doppler-Lidar method of wind measurement
[AD-A080549] N80-23623

DRAG
Data processing systems for accelerometer experiments on air force satellites
[AD-A080460] N80-23913
Collective drag experienced by an electron beam in the pure runaway regime
[AD-A081116] N80-24145

DRAINAGE
LANDSAT reconnaissance images of the great soil region in the western part of the Paraiba Basin — Brazil
[E80-10103] N80-23730

DRUGS
Procedure of practical exercise with students on the pathogenic effect of accelerations on the organism
[NASA-TM-76120] N80-23976

DUCTED FLOW
Oscillations of the supersonic flow at an area of abrupt increase in duct cross-section
[MPIS-23/1978] N80-23263

DURABILITY
Development of improved-durability plasma sprayed ceramic coatings for gas turbine engines
[NASA-TM-81512] N80-23313

DUST
Monitoring dust concentrations. Modifications to the dust monitor FH62A
[IG-TNO-F-1468] N80-23886
Project filter holder. Tests on 25 mm dust filter holders
[IG-TNO-F-1638] N80-23887
Air pollution studies in the Nieuwe-Waterweg region using deposit gages, 1977 data — Netherlands
[IG-TNO-G-771] N80-23897

DUST COLLECTORS
Monitoring dust concentrations. Modifications to the dust monitor FH62A
[IG-TNO-F-1468] N80-23886

DYE LASERS
Medium effects of fluorescence quantum yields and lifetimes for coumarin laser dyes
[AD-A081748] N80-23640
Solvent effects on photophysical parameters for coumarin laser dyes
[AD-A081749] N80-23641
Intracavity absorber effects in a CW dye laser
[COO-4448-2] N80-23647
High resolution optical ranging system
N80-24150

DYES
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells
[LBL-9916] N80-23785

DYNAMIC CHARACTERISTICS
Dynamics of a moving mass being abruptly stopped by a cable
[AD-A081158] N80-23887
Dynamic properties of vortices in Josephson tunnel junctions N80-24184

DYNAMIC LOADS
Progressive settlements of foundations on cohesionless soils subjected to vertical vibratory loadings N80-23494

DYNAMIC MODELS
Comparative measuremnets in four European wind tunnels of the unsteady pressures on an oscillating model
[AGARD-R-673] N80-23338
Investigation of tidal displacements of the Earth's surface by laser ranging to GEOS-3
[NASA-CR-156863] N80-23908
Comparison and verification of dynamical and statistical Lake Erie storm surge forecasts
[PB80-137797] N80-23954
DYNAMIC PROGRAMMING
Digital simulation of dynamic processes in radiometer systems — microwave radiometers
[NASA-CR-159266] N80-23563
A dynamic programming algorithm for phase estimation and data decoding on random phase channels
[AD-A081314] N80-23564
A random sampler of dynamic programming applications in signal processing and control
[AD-A081485] N80-24007
Denumerables state semi-Markov decision processes with unbounded costs, average cost criterion
[MC-BW-92/78] N80-24071
The Roberson/Wittenburg formalism and the package MULTIBODY for computer simulations of multibody systems
[ESA-TT-557] N80-24097
DYNAMIC RESPONSE
Axial flow rotor unsteady performance
N80-23308
Dynamic mechanical measurement of polyphenylsulfone (Radel)
[AD-A077281] N80-23467
The Shock and Vibration Digest, volume 11, no. 9
[AD-A074320] N80-23490
Techniques and applications of mechanical signature analysis N80-23491
The Shock and Vibration Digest, volume 11, no. 11
[AD-A078375] N80-23669
A review of substructure analysis of vibrating systems N80-23670
Critical damping in linear discrete dynamic systems
[AD-A081085] N80-23688
Modeling the circulation of carbon in the world's terrestrial ecosystems
[DOE/TIC-10293] N80-23710
Update on the low wave number content of TBL pressure fields N80-24249
The Shock and Vibration Digest, volume 11, no. 10
[AD-A078374] N80-24250
The Shock and Vibration Digest, volume 11, no. 2
[AD-A079549] N80-24254
DYNAMIC STABILITY
An analysis of the static and dynamic instability of thick cylinders
[OUEL-1292/79] N80-23709
DYNAMIC STRUCTURAL ANALYSIS
Dynamics of a flexible rotor-tower system
[ASRL-TR-194-1] N80-23862
Recent research in composite and sandwich plate dynamics N80-24252
A survey of structural optimization under dynamic constraints N80-24256
DYNAMOMETERS
Fuel consumption measurements-carbon balance versus flow meter
[PB80-129549] N80-24218

E

E REGION
The physics of the photodeposition phase of the NRL master code for the disturbed E and F regions
[AD-A081776] N80-23916
E-3A AIRCRAFT
E-3A EMP evaluation program
[AD-A081725] N80-23536
EARTH ALBEDO
A time variable model of Earth's albedo — for climatology studies and interpretation of satellite data
[NASA-CR-159259] N80-23935
EARTH CRUST
Sm-Nd and Rb-Sr chronology of crustal formation. Part 1: Ba, Nd and Sm isotopic anomalies in the Allende meteorite, part 2 N80-24235
EARTH HYDROSPHERE
Remote Sensing and Problems of the Hydrosphere. A Focus for Future Research — conferences
[NASA-CP-2132] N80-23956
Bioprocesses — in the marine environment
N80-23957
EARTH MANTLE
Sm-Nd and Rb-Sr chronology of crustal formation. Part 1: Ba, Nd and Sm isotopic anomalies in the Allende meteorite, part 2 N80-24235
EARTH PLANETARY STRUCTURE
Applications of a dedicated gravitational satellite mission — to study of oceanic circulation and earth structure
[AD-A076436] N80-23917
EARTH SURFACE
Investigation of tidal displacements of the Earth's surface by laser ranging to GEOS-3
[NASA-CR-156863] N80-23908
ECLIPSING BINARY STARS
Observations and analysis of four eclipsing binary systems N80-24219
ECOLOGY
Voorne-Putten: A landscape-ecological survey — Rhine delta, Netherlands
[REPT-4] N80-23761
ECONOMETRICS
Regression analysis for mixed cross-section and time-series data with references to some incomplete observations techniques
[MC-SW-61/78] N80-24063
ECONOMIC ANALYSIS
Solving staircase linear programs by the simplex method. 1: Inversion
[AD-A081713] N80-24050
ECONOMIC IMPACT
Direct Regional Energy/Economic Modeling (DREEM) design
[DOE/EIA/6345-1] N80-23847
ECONOMICS
Proposition on energy analysis and economic efficiency
[SERI/RR-51-332] N80-23805
Federal Republic of Germany: Estimates of future energy/GDP relationships
[ORAU/IEA(M)-79-22] N80-23841
Direct Regional Energy/Economic Modeling (DREEM) design
[DOE/EIA/6345-1] N80-23847
United Kingdom: Estimates of future energy/GDP relationship
[ORAU/IEA(M)-79-25] N80-23848
Canada: Estimates of future energy/GNP relationships
[ORAU/IEA(M)-79-24] N80-23849
ECOSYSTEMS
Modeling the circulation of carbon in the world's terrestrial ecosystems
[DOE/TIC-10293] N80-23710
EDGES
Method of forming a sharp edge on an optical device
[NASA-CASE-GSC-12348-1] N80-24149
EFFECTS
The VIBRA-8 subsonic aerodynamic nuclear gust vulnerability code
[AD-A081722] N80-23256
EGRESS
Emergency in-flight egress opening for general aviation aircraft — pilot bailout N80-23511
EIGENVALUES
Eigenvalue and near Eigenvalue problems solved by Brandt's multigrid method
[AD-A081318] N80-24052
EIGENVECTORS
Eigenvalue and near Eigenvalue problems solved by Brandt's multigrid method
[AD-A081318] N80-24052
EJECTION SEATS
Orbiter emergency crew escape system
N80-23499
ELASTIC DEFORMATION
Elastic-plastic deformation at finite strain
N80-23672
ELASTIC PROPERTIES
Elastic constants for superplastically formed/diffusion-bonded corrugated sandwich core
[NASA-TP-1562] N80-23677
Boundary value problems of the circular cylinders in the strain-gradient theory of linear elasticity
[GA-A-15142] N80-23701
The indentation of an elastic layer by a rigid stamp under conditions of complete adhesion
[MC-TW-181/78] N80-23703
ELASTIC SCATTERING
Measurements of the total elastic scattering cross section for argon on argon at collision energies below four millivolts N80-24136
ELASTIC WAVES
Update on the low wave number content of TBL pressure fields N80-24249
ELASTODYNAMICS
The equations of elasticity are special
[AD-A081668] N80-23695
ELASTOPLASTICITY
Interaction of large amplitude stress waves in layered elastic-plastic materials
[AD-A081429] N80-23691
ELASTOSTATICS
Analytical stress analysis of elastic composites with cracks
[UCRL-15109] N80-23696
ELECTRIC AUTOMOBILES
Fuel cell systems for vehicular applications
[LA-UR-79-2826] N80-24214
ELECTRIC BATTERIES
The ac-dc power processor, type 1
[AD-A081545] N80-23577
ELECTRIC CHARGE
Electric fuel nozzles for combustors
[SAN/1442-79/T1] N80-23560
ELECTRIC CORONA
Design considerations of a flow system for transient laser discharge experiments
[AD-A080942] N80-23642
ELECTRIC CURRENT
A survey of the high frequency effects associated with the lightning discharge
[OUEL-1290/79] N80-23590
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells
[LBL-9916] N80-23785
Vortices in superconducting films
[ISM-258] N80-24195
ELECTRIC DISCHARGES
Chemical physics of charge mechanisms in nonmetallic spacecraft materials
[AD-A081487] N80-23363
A study of the variability of thunderstorm electrical events based on very-low-frequency electromagnetic data
[AD-A081305] N80-23944
ELECTRIC ENERGY STORAGE
Laminated composite disc flywheel development
[UCRL-15154] N80-23843
ELECTRIC FIELDS
A survey of the high frequency effects associated with the lightning discharge
[OUEL-1290/79] N80-23590
Proceedings of the Workshop on Electrical and Biological Effects Related to HVDC Transmission
[PNL-3121] N80-23979
ELECTRIC FILTERS
New results on the innovations problem for non-linear filtering
[AD-A081574] N80-23566
ELECTRIC GENERATORS
Conversion system overview assessment. Volume 2: Solar-wind hybrid systems
[SERI/TR-35-078-VOL-2] N80-23799
ELECTRIC HYBRID VEHICLES
Electric and hybrid vehicle program
[DOE/CS-0026] N80-24216
Electric and hybrid vehicles in the urban future — market research
[CONF-791009-23] N80-24217
ELECTRIC MOTOR VEHICLES
Research, development and demonstration of nickel-zinc batteries for electric vehicle propulsion
[ANL/OEPM-79-12] N80-23861
Fuel cell systems for vehicular applications
[LA-UR-79-2826] N80-24214

Research, development, and demonstration of nickel-zinc batteries for electric vehicle propulsion — electrode development program
[ANL/OEPM-78-10] N80-24215
Electric and hybrid vehicle program
[DOE/CS-0026] N80-24218

ELECTRIC POWER PLANTS
The optimization air separation plants for combined cycle MHD-power plant applications
[NASA-TM-81510] N80-23778
Summary and evaluation of the parametric study of potential early commercial MHD power plants (PSPEC)
[NASA-TM-81497] N80-23780
Naval facility energy conversion plants as resource recovery system components
[AD-A081232] N80-23783
Environmental assessment methodology: Solar power plant applications. Volume 2: Industrial implications and secondary-impact methodology
[EPRI-ER-1070-VOL-2] N80-23786
Electricity from refuse — technology assessment
[NZEROC-44] N80-23803
Solar thermal repowering utility value analysis
[SERI/TR-8016-1] N80-23814
Conceptual design of thermal energy storage systems for near-term electric utility applications
[NASA-CR-159577] N80-23842
Identification system for apparatus and plant used in thermal power stations
[PNR-90008] N80-23863
The chemical transformation of sulfur dioxide to sulfate in the plume of the coal-burning Keystone power plant N80-23873

ELECTRIC POWER SUPPLIES
On the advanced power system configuration study
[TP-7753] N80-23355
Aegis spy-1 radar 5-v/60-a switching-mode power supply stability analysis: A stability analysis employing state-space averaging techniques for converter modeling
[AD-A080449] N80-23532

ELECTRIC POWER TRANSMISSION
Field tests of the Liberty-Mead transmission system
[PB80-125610] N80-23591

ELECTRICAL FAULTS
Study of electronic transport and breakdown in thin insulating films
[AD-A081135] N80-24186

ELECTRICAL IMPEDANCE
Effective behavior of composite materials
[AD-A078466] N80-23378
Latch-up control in CMOS integrated circuits
[SAND-79-1479C] N80-23583

ELECTRICAL PROPERTIES
Crystal growth of device quality GaAs in space
[NASA-CR-153190] N80-24185

ELECTRICAL RESISTIVITY
Effective behavior of composite materials
[AD-A078466] N80-23378

ELECTRO-OPTICS
Chabot Observatory Remote Sensing Experiments (CORSE) — determining the relationship between weather and air pollution
[UCID-18504] N80-23758

ELECTROCHEMICAL CELLS
Redox storage systems for solar applications
[NASA-TM-81464] N80-23777

ELECTROCHEMICAL OXIDATION
Electro-oxidation of hydrogen and propane in strong organic acid electrolytes N80-23392

ELECTRODES
Oxygen reduction of a graphite paste and a catalyst loaded graphite paste electrode N80-23390
Grids for maintenance-free storage batteries made from lead-alkaline earth metal-alloys
[BMFT-FB-T-79-21] N80-23884
Research, development, and demonstration of nickel-zinc batteries for electric vehicle propulsion — electrode development program
[ANL/OEPM-78-10] N80-24215

ELECTROLYSIS
Electro-oxidation of hydrogen and propane in strong organic acid electrolytes N80-23392
Mass transport in molten-salt electrochemical systems
[ORNL/MIT-290] N80-23400

ELECTROLYTES
Electro-oxidation of hydrogen and propane in strong organic acid electrolytes N80-23392
Mass transport in molten-salt electrochemical systems
[ORNL/MIT-290] N80-23400
Determination and estimation of ionic activities of metal salts in water
[PB80-112212] N80-23416

ELECTROMAGNETIC FIELDS
Modification of the aurora electromagnetic environment experiment and interpretation — electromagnetic field produced by a thick target using parallel plate transmission lines
[AD-A080804] N80-23534
Study of the possible effects of 110 kHz electromagnetic fields on humans
[SAND-77-7028] N80-23981

ELECTROMAGNETIC INTERACTIONS
Chemical physics of charge mechanisms in nonmetallic spacecraft materials
[AD-A081487] N80-23383

ELECTROMAGNETIC INTERFERENCE
Communications-electronic intrasystem electromagnetic interference measurement technique and instrumentation
[AD-A081830] N80-23537

ELECTROMAGNETIC PROPERTIES
A study of the variability of thunderstorm electrical events based on very-low-frequency electromagnetic data
[AD-A081305] N80-23844

ELECTROMAGNETIC PULSES
Electromagnetic penetration through a slot in a screen covered by a dielectric slab N80-23527
Modification of the aurora electromagnetic environment experiment and interpretation — electromagnetic field produced by a thick target using parallel plate transmission lines
[AD-A080804] N80-23534
E-3A EMP evaluation program
[AD-A081725] N80-23536

ELECTROMECHANICAL DEVICES
Coal-shale interface detector
[NASA-CASE-MFS-23720-1] N80-23711

ELECTRON BEAMS
Efficiency improvements in coupled cavity traveling wave tubes
[AD-A080861] N80-23575
Collective drag experienced by an electron beam in the pure runaway regime
[AD-A081116] N80-24145

ELECTRON BUNCHING
The collective acceleration mechanism of solar cosmic rays — nuclei trapped by electron bunching
[IFVE-OTF-79-112] N80-24246

ELECTRON DISTRIBUTION
Study of the general plasma characteristics of a high power multifilament ion source
[LBL-8940] N80-24178
The effect of transport phenomena on electron velocity distribution functions and ion abundances in the solar chromosphere-corona transition region N80-24239

ELECTRON ENERGY
Electronic structure of semiconducting surface inversion layers — energies of subbands N80-24183

ELECTRON MOBILITY
Study of electronic transport and breakdown in thin insulating films
[AD-A081135] N80-24186
The effect of transport phenomena on electron velocity distribution functions and ion abundances in the solar chromosphere-corona transition region N80-24239

ELECTRON SCATTERING
Scattering of low-energy electrons by laser excited sodium atoms in the 3 2P 3/2 state N80-24137

ELECTRON SPECTROSCOPY
An electron spectroscopic investigation of the interaction of methanol and ammonia with clean and partially oxidized aluminum surfaces N80-23386

ELECTRON TRANSFER
CECAM Workshop on Transport of Fast Electrons in Laser Fusion Plasmas
[LA-UR-79-3308] N80-24171
Study of electronic transport and breakdown in thin insulating films
[AD-A081135] N80-24186

ELECTRON TUNNELING
Dynamic properties of vortices in Josephson tunnel junctions N80-24184

ELECTRONIC AIRCRAFT
E-3A EMP evaluation program
[AD-A081725] N80-23536

ELECTRONIC EQUIPMENT TESTS
E-3A EMP evaluation program
[AD-A081725] N80-23536

ELECTRONIC MODULES
Global Positioning Systems (GPS) High Dynamic User Equipment (HDUE). Volume 2: Set description
[AD-A076480] N80-23290
Global Positioning System (GPS) High Dynamic User Equipment (HDUE). Volume 3: Set description
[AD-A076481] N80-23291

ELECTROSTATIC SHIELDING
Electrostatic protection of the Solar Power Satellite and rectenna
[NASA-CR-161438] N80-23348

ELEMENTARY PARTICLE INTERACTIONS
The effects of phonon dynamics on the singular behavior of a one-dimensional Fermi gas N80-23598

ELEVATION ANGLE
Nationwide forestry applications program: Corrections to forest reflectance as a function of low Sun angle and slope — Washington County, Missouri
[E80-10100] N80-23727

ELLIPTIC DIFFERENTIAL EQUATIONS
Boundary conditions for the numerical solution of elliptic equations in exterior regions
[NASA-CR-153185] N80-24044
On a class of elliptic singular perturbations with applications in population genetics
[MC-TW-184/78] N80-24087

EMISSION SPECTRA
Medium effects of fluorescence quantum yields and lifetimes for coumarin laser dyes
[AD-A081748] N80-23640
Solvent effects on photophysical parameters for coumarin laser dyes
[AD-A081749] N80-23641

EMISSIVITY
The measurement of the transmission and the emission of the atmosphere by an infrared spectroradiance meter
[PHL-1979-50] N80-23823

ENERGETIC PARTICLES
Energetic particle studies: Instrumentation and analysis
[AD-A081714] N80-23950

ENERGY CONSERVATION
CF6 jet engine performance improvement: New fan
[NASA-CR-159699] N80-23309
Basic research needs in energy conservation
[LBL-9939] N80-23794
Use of adaptive optimal control to provide energy conservation in large buildings
[LA-UR-79-3354] N80-23804
Series solar heat pump and energy conservation
[BNL-27012] N80-23857
Energy policy impact evaluation
[PB80-137953] N80-23866

ENERGY CONSUMPTION
Regional application of fossil energy technologies: An analytical approach
[DOE/ET-3442-1] N80-23830
Federal Republic of Germany: Estimates of future energy/GDP relationships
[ORAU/IEA(M)-79-22] N80-23841
United Kingdom: Estimates of future energy/GDP relationship
[ORAU/IEA(M)-79-25] N80-23848
Canada: Estimates of future energy/GNP relationships
[ORAU/IEA(M)-79-24] N80-23849
Process applications for geothermal energy resources
[COO-4896-T1] N80-23864

ENERGY CONVERSION
Conceptual design of a coal-to-methanol-to-gasoline commercial plant. Volume 3: Environmental
[FE-2416-43-VOL-3] N80-23465
Research and evaluation of biomass resources/conversion/utilization systems (market/experimental analysis for development of a data base for a fuels from biomass model)
[COO-5022-9] N80-23486

Research and evaluation of biomass resources/conversion/utilization systems (market/experimental analysis for development of a data base for a fuels from biomass model)
[COO-6922-6] N80-23487
Cell module and fuel conditioner development
[NASA-CR-159628] N80-23769
Cell module and fuel conditioner
[NASA-CR-159675] N80-23769
The aerodynamics of axial flow wind power turbines
[CSIR-ME-1019] N80-23781
Naval facility energy conversion plants as resource recovery system components
[AD-A081232] N80-23783
Mechanism of energy conversion and transfer in bioluminescence

[DOE/ET-2442-1] N80-23830
Millville Wind Turbine Generator: Failure analysis and corrective design modification
[RFP-2992/3533/79-3] N80-23831
Production of sugarcane and tropical grasses as a renewable energy source
[ORO-5912-T1] N80-23840
Vertical axis wind turbine development: Executive summary
[ORO-5135-77-5-SUMM] N80-23845
Vertical axis wind turbine development
[ORO-5135-77-5] N80-23846
Investigation of the technical and economic feasibility of using pumped well-water energy storage systems
[SAND-79-7096] N80-23851

Solar reflector materials
[PNL-SA-7698] N80-23859
Research, development and demonstration of nickel-zinc batteries for electric vehicle propulsion
[ANL/OEPM-78-12] N80-23861
Solar energy systems: Standards for rubber hose
[PB80-129826] N80-23868
Environmental development plan for biomass energy systems
[DOE/EDP-0032] N80-23876
Environmental development plan: Geothermal energy systems
[DOE/EDP-0036] N80-23877
Environmental development plans for energy technology programs
[DOE/EDP-0062] N80-23881
Technical information dissemination plan for the US Department of Energy, ETS/Solar Divisions
[SERI/SP-69-071] N80-24205
Electric and hybrid vehicle program
[DOE/CS-0026] N80-24216

ENERGY TRANSFER
Mechanism of energy conversion and transfer in bioluminescence
[SRO-635-7] N80-23787

ENGINE DESIGN
Carburetor ice: A review
[TR-77-19] N80-23280
Conceptual design study of an improved gas turbine powertrain
[NASA-CR-159852] N80-23315

ENGINE PARTS
Property screening and evaluation of ceramic turbine engine materials
[AD-A080963] N80-23322

ENGINE TESTS
CF6-6D engine short-term performance deterioration
[NASA-CR-159830] N80-23316

ENGLISH CHANNEL
Signal level distributions and fade event analyses for a 5 GHz microwave link across the English Channel
[PB80-129398] N80-23557

ENGLISH LANGUAGE
Logical investigations on PTQ arising from programming requirements
[MC-ZW-117/78] N80-24025

ENVIRONMENT EFFECTS
Engine environmental effects on composite behavior
[NASA-TM-81508] N80-23370
Environmental assessment of the utilization of alcohol fuels in highway vehicle applications
[CONF-791009-19] N80-23477
Remote sensing for geothermal environmental assessments --- Imperial Valley and The Geysers, California
[UCRL-15108] N80-23756
Environmental assessment methodology: Solar power plant applications. Volume 2: Industrial implications and secondary-impact methodology
[EPRI-ER-1070-VOL-2] N80-23786
Evaluating and minimizing noise impact due to aircraft flyover
[NASA-CR-153187] N80-23874
Potential air quality impact of geothermal power production in the Imperial Valley
[UCRL-52797] N80-23878
Environmental development plans for energy technology programs
[DOE/EDP-0062] N80-23881
Coastal sedimentation N80-23960

ENVIRONMENT PROTECTION
Conceptual design of a coal-to-methanol-to-gasoline commercial plant. Volume 3: Environmental
[FE-2416-43-VOL-3] N80-23485
Assessment of potential exposure to friable insulation materials containing asbestos
[NASA-TM-81435] N80-23875
Environmental development plan for biomass energy systems
[DOE/EDP-0032] N80-23876
Environmental development plan: Geothermal energy systems
[DOE/EDP-0036] N80-23877
Environmental standards for coal conversion processes. Volume 1: Most stringent, federal, and selected state regulations
[PB80-126980] N80-23904

ENVIRONMENTAL MONITORING
Prelaunch summary: NOAA-B launch
[NASA-TM-81060] N80-23340
Modeling the circulation of carbon in the world's terrestrial ecosystems
[DOE/TIC-10293] N80-23710
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Sybsystem (RSIS): User's guide
[E80-10088] N80-23715
Integrated use of LANDSAT data for state resource management --- Arizona, Georgia, North Dakota, and Texas
[E80-10095] N80-23722
Remote sensing for geothermal environmental assessments --- Imperial Valley and The Geysers, California
[UCRL-15108] N80-23756

ENVIRONMENTAL TESTS
Aircraft carrier exposure tests of aluminum alloys
[AD-A081060] N80-23433
Decision path approach to guidance for climatic environmental test planning (MIL-STD-810C)
[AD-A080909] N80-23666
Solar energy systems: Test methods for collector insulations
[PB80-132038] N80-23867

ENVIRONMENTS
Energy storage technology-environmental implications of large scale utilization
[LA-UR-79-3098] N80-23801

ENZYMOLOGY
Photochemistry and enzymology of photosynthesis
[COO-3326-82] N80-23965

EPIDEMIOLOGY
Run for your life. A note on the asymptotic speed of propagation of an epidemic
[MC-TW-176/78] N80-24117

EPITAXY
Amphoteric gallium arsenide heteroface solar cells N80-23765
Crystal growth of device quality GaAs in space
[NASA-CR-153190] N80-24185
Electronic processes in InP and related compounds --- measurement of ionization coefficients and the epitaxial growth of InP
[AD-A080802] N80-24188
Liquid phase epitaxial growth of gallium arsenide
[AD-A081835] N80-24191
HgCdTe avalanche photodiode development
[AD-A081595] N80-24193

EPOXY COMPOUNDS
Flight service evaluation of Kevlar-49 epoxy composite panels in wide-bodied commercial transport aircraft
[NASA-CR-159231] N80-23371
Shock and vibration performance of an epoxy chocking compound
[AD-A078496] N80-23468

EPOXY RESINS
Room temperature curing resin systems for graphite/epoxy composite repair
[AD-A081738] N80-23373
Application of graphite/epoxy composites for the SPS-10 radar reflector
[AD-A077530] N80-23380
Shock and vibration performance of an epoxy chocking compound
[AD-A078496] N80-23468

EQUATIONS OF MOTION
General perturbations theories derived from the 1965 lane drag theory
[AD-A081264] N80-23347
Studies in the small motions of viscoelastic solids N80-23673

EQUATIONS OF STATE
Laser-driven shockwave experiments at extreme high pressures --- determining equation of state data
[UCRL-83372] N80-23649

EQUIPMENT SPECIFICATIONS
Spacecraft radiators for advanced mission requirements
[NASA-CR-160589] N80-23362

ERGODIC PROCESS
Ergodic orbits in particle simulations of strong ion rings
[AD-A081391] N80-24168

EROSION
Voorne-Putten: A landscape-ecological survey --- Rhine delta, Netherlands
[REPT-4] N80-23761
Summary of the research and development effort on open-cycle coal-fired gas turbines
[ORNL/TM-6253] N80-23821

ERROR ANALYSIS
A flight investigation of system accuracies and operational capabilities of a general aviation/air transport area navigation system (RNAV)
[AD-A081646] N80-23268
Chances and handicaps of rod-beam theories
[ESA-TT-568] N80-23705
Recovery from soft errors in triplicated computer systems operating in lock-step
[PB80-126931] N80-23999

ERROR CORRECTING CODES
A comparison of bounds of Delsarte and Lovasz
[MC-ZW-118/78] N80-24026
Intermittent/transient faults in computer systems: Executive summary
[NASA-CR-159229] N80-24114

ERROR DETECTION CODES
Intermittent/transient faults in computer systems: Executive summary
[NASA-CR-159229] N80-24114

ESCAPE SYSTEMS
Orbiter emergency crew escape system N80-23499

ESTIMATES
Testing with replacement and the product limit estimator
[MC-SW-57/78] N80-24110

ESTUARIES
LANDSAT's role in state coastal management programs --- New Jersey and Texas
[E80-10101] N80-23728

ETHANE
Battery-powered, differential infrared absorption sensor for methane, ethane, and other hydrocarbons
[UCRL-83317] N80-23829

EUROPEAN SPACE PROGRAMS
Space research activities in Spain --- outlining Spanish space research N80-24212

EUTECTIC ALLOYS
Directional solidification of manganese-bismuth/bismuth alloys N80-23422
Analysis of possible improvements of alloys due to directional eutectic solidification in zero gravity conditions
[ESA-TT-575] N80-23447

EUTECTICS
Fatigue crack propagation in a directionally solidified cobalt-base eutectic N80-23426

EVAPORATION
Induced evaporation of metal from an aluminum surface by a normal pulse neodymium laser
[AD-A081601] N80-23638

EVAPOTRANSPIRATION
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

EXCIMER LASERS
High pressure noble gas alkali vapor mixtures and their visible and infrared excimer bands
[AD-A081808] N80-23643

EXCITATION
Multiquantum ultraviolet excitation of atoms and molecules N80-24135

EXCRETION
Relationship between urinary 3-methylhistidine excretion and components of body composition in man N80-23972

EXHAUST EMISSION
The effect of catalyst length and downstream reactor distance on catalytic combustor performance
[NASA-TM-81475] N80-23779

EXHAUST GASES
The chemical transformation of sulfur dioxide to sulfate in the plume of the coal-burning Keystone power plant N80-23873

EXHAUST NOZZLES
Atmospheric dispersion of high velocity jets
[AD-A081612] N80-23321
F100 exhaust nozzle area control N80-23513
EXPERIMENTAL DESIGN
Suggested experiments for momentum-free G-simulation using the Long Duration Exposure Facility (LDEF)
[TUM-LRT-KB-77/18] N80-23360
E-3A EMP evaluation program
[AD-A081725] N80-23536
Laser-driven shockwave experiments at extreme high pressures --- determining equation of state data
[UCRL-83372] N80-23649
Decision path approach to guidance for climatic environmental test planning (MIL-STD-810C)
[AD-A080909] N80-23666
Gladstone-Dale constant for CF4 --- experimental design
[NASA-TM-80228] N80-24151
EXPLOSIVES
Performance and properties of extrusion cast explosives composed of HMX, FEFO and AFNOL
[UCID-18333] N80-23479
Initiation of granular explosives by ramp waves
[SAND-79-1169C] N80-23480
Explosives research and development: Recommendations and comments on unsolved problems
[LA-8124-MS] N80-23486
EXPONENTIAL FUNCTIONS
A generalization of Decartes' rule
[MC-ZW-115/78] N80-24095
EXTENSOMETERS
Development of a laser interferometric dilatometer
[SAND-79-1714C] N80-23650
EXTRAVEHICULAR ACTIVITY
Orbiter door closure tools N80-23498
EVA manipulation and assembly of space structure columns
[NASA-CR-3285] N80-23988
EXTREMUM VALUES
The selection of an extreme-value distribution
[AD-A080884] N80-24105

F

F REGION
The physics of the photodeposition phase of the NRL master code for the disturbed E and F regions
[AD-A081776] N80-23916
F-4 AIRCRAFT
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2A: Specific application study no. 1, close air support
[AGARD-AR-147-VOL-2A] N80-23303
F-15 AIRCRAFT
Improved packaging for the LN-31 inertial measurement unit (F-15 aircraft)
[AD-A081745] N80-23293
F-17 AIRCRAFT
Precision controllability of the YF-17 airplane
[NASA-TP-1677] N80-23327
F-100 AIRCRAFT
F100 exhaust nozzle area control N80-23513
F-106 AIRCRAFT
Storm hazards '79: F-106B operations summary
[NASA-TM-81779] N80-23282
FABRICS
Adjustable high emittance gap filler --- reentry shielding for space shuttle vehicles
[NASA-CASE-ARC-11310-1] N80-23454
FACTOR ANALYSIS
Categorization of watershed land cover units with LANDSAT data --- semiarid watershed in Utah N80-23712
Automatic factorization of generalized upper bounds in large scale optimization models
[AD-A081614] N80-24017
FAILURE ANALYSIS
Failure analysis in aviation
[NLR-MP-78026-U] N80-23284
The failure of aircraft structures
[NLR-MP-78040-U] N80-23285
Intermittent/transient faults in computer systems: Executive summary
[NASA-CR-159229] N80-24114
FAILURE MODES
Intermittent/transient faults in computer systems: Executive summary
[NASA-CR-159229] N80-24114
FAR FIELDS
On the organized large-scale structure in a turbulent round jet and its far-field sound N80-23593
Far-field radiation of aft turbofan noise
[NASA-TM-81506] N80-24129
FAR INFRARED RADIATION
Efficient adaptive FIR and IIR Filters
[AD-A081605] N80-24158
FARM CROPS
Carbohydrate crops as a renewable resource for fuels production. Volume 1: Agricultural research
[BMI-2031-VOL-1] N80-23481
FARMLANDS
Agricultural soil moisture experiment: 1978 Colby (Kansas) data catalog and documentation --- Thomas County, Kansas
[E80-10098] N80-23725
Neutron-meter calibration for the 1978 Colby soil moisture experiment --- Thomas County, Kansas
[E80-10120] N80-23746
Interpreting land use change through satellite imagery --- Great Plains and Southeastern Alluvium Coast and Tidewater regions
[PB80-127277] N80-23764
FATIGUE (BIOLOGY)
Time for recovery from successive bouts of exercise as measured by changes in the anaerobic threshold: A comparison of recovery intervals of 24 and 48 hours N80-23970
FATIGUE (MATERIALS)
Fatigue characterization of composite materials
[AD-A081320] N80-23372
Fatigue crack propagation in a directionally solidified cobalt-base eutectic N80-23426
Quantitative fractography of a fatigued Ti-26 w/o V alloy
[AD-A079813] N80-23431
An investigation of residual stresses in simulated wing panels of 7075-T6 aluminum
[AD-A080863] N80-23693
Evaluation of the round compact specimen for fatigue-crack growth rate testing
[HEDL-SA-1810] N80-23699
Fatigue in welded metal structures: An introductory report to a research program
[LPC-85] N80-23704
FATIGUE LIFE
The failure of aircraft structures
[NLR-MP-78040-U] N80-23285
The effects of deformation mode on the behavior of Ti-26%V and Ti-32%V alloys N80-23423
The effect of microstructure on the fatigue behavior of an aluminum-lithium alloy --- aluminum lithium manganese alloys N80-23424
Materials evaluation. Part 2: Development of corrosion inhibitors
[AD-A080905] N80-23434
The significance of the fatigue strength in the powder metallurgy
[ICAF-1134] N80-23676
FATIGUE TESTS
Gust severity effects on fatigue crack propagation in aluminum alloy sheet materials
[NLR-MP-78041-U] N80-23449
FEASIBILITY ANALYSIS
Low-cost computer-aided instruction/computer-managed instruction CAI/CMI system: Feasibility study
[AD-A081072] N80-24014
FEDERAL BUDGETS
National Aeronautics and Space Administration Authorization Act, 1981
[S-96-719] N80-24210
NASA authorization, 1981
[GPO-59-526] N80-24211
FEEDBACK AMPLIFIERS
Low-noise wide-band amplifier system for stochastic beam cooling experiments
[LBL-9841] N80-23580
FEEDBACK CONTROL
The performance of a sampled data delay lock loop implemented with a Kalman loop filter
[AD-A081822] N80-23569
The M/G/1 queue with instantaneous Bernoulli feedback
[AD-A081256] N80-24038
Wiener-Hopf approaches to regulator, filter/observer, and optical coupler problems
[AD-A081489] N80-24049
FERMENTATION
Retrospective search on the biochemical production of alcohol fuels
[NP-24137] N80-23476
FERMI-DIRAC STATISTICS
The effects of phonon dynamics on the singular behavior of a one-dimensional Fermi gas N80-23598
FIBER COMPOSITES
Engine environmental effects on composite behavior
[NASA-TM-81508] N80-23370
Dynamic mechanical properties of fiber-reinforced composite materials N80-24251
FIBER OPTICS
A 3-5 heterostructure avalanche photodiode modules for fiber optic communication links in the 1.0 to 1.3 micrometer spectral range
[AD-A081185] N80-23539
The 3-V heterostructure avalanche photodiode modules for fiber optic communication links in the 1.0 to 1.3 micrometer spectral range
[AD-A081747] N80-23542
Analysis of multimode fiber couplers, tapers and mode converters
[AD-A081669] N80-24154
Evaluation of NRL glass for fiber optics, phase 1 --- for use as waveguides
[AD-A081582] N80-24155
The behavior of optical glass fibers at extreme temperatures
[PHL-1978-37] N80-24162
FIELD EFFECT TRANSISTORS
Monolithic integration of microwave GaAs power FETs
[AD-A080793] N80-23574
FIELD THEORY (PHYSICS)
On disturbance fields of moving singularities in aerodynamics and aeroacoustics
[ESA-TT-570] N80-23269
Synthesis of baryons from unconfined quarks
[ORO-3992-371] N80-24147
Transient field reversal with a proton layer --- for plasma confinement
[AD-A081724] N80-24169
On vacuum fluctuations of a scalar field in a localized region of spacetime N80-24199
FIGHTER AIRCRAFT
Theory of disturbance-utilizing control with application to missile intercept problems
[AD-A081110] N80-23329
Definition of a two-level control system for nonlinear motion of an aircraft
[ESA-TT-614] N80-23330
FILE MAINTENANCE (COMPUTERS)
Global program analysis in an interactive environment N80-24000
FILLERS
Adjustable high emittance gap filler --- reentry shielding for space shuttle vehicles
[NASA-CASE-ARC-11310-1] N80-23454
FILM COOLING
A calculation method for convective heat and mass transfer in multiply-slotted film-cooling applications
[AD-A081641] N80-23609
FILM THICKNESS
Measurement of the thickness of liquid film by means of capacitance method
[EPRI-NP-1212] N80-23614
FILTERS
Project filter holder. Tests on 25 mm dust filter holders
[IG-TNO-F-1638] N80-23887
FILTRATION
Filtering meteorological flight data
[DFVLR-MITT-79-19] N80-23949
FINITE DIFFERENCE THEORY
A nonlinear vector finite difference scheme
[MC-BW-89/78] N80-24069
Theory and numerical methods of resolution of partial differential equations
[ESA-TT-606] N80-24098
FINITE ELEMENT METHOD
Finite element analysis of subsonic, transonic and supersonic flows around missiles
[AD-A077375] N80-23261

Finite element simulation of simple three-dimensional fully cavitating flows N80-23594
A review of substructure analysis of vibrating systems N80-23670
Computer programs: Shock and vibration isolation N80-23671
Elastic-plastic deformation at finite strain N80-23672
User's manual to the ACTION computer code
[NASA-CR-144973] N80-23680
Implicit strain-hardening formulation for creep analysis
[K/CSD/TM-30] N80-23702
Application of laser ranging and VLBI data to a study of plate tectonic driving forces — finite element method N80-23810
Theory and numerical methods of resolution of partial differential equations
[ESA-TT-606] N80-24098

FIRE PREVENTION
Fire-resistant hydraulic fluids in enclosed marine environments
[PB80-125545] N80-23470

FIXED POINTS (MATHEMATICS)
Equivalence of LCP and PLS — linear complementarity and piecewise linear systems
[AD-A080890] N80-24016

FLAPS (CONTROL SURFACES)
Summary of data required for the AGARD SMP activity standard aeroelastic configurations - two-dimensional configurations
[NLR-MP-79015-U] N80-23273

FLAT PLATES
Study and analysis of a low cost cement bonded flat plate solar collector
[ALO-4122-T1] N80-23816
Solar collector fluid parameter study
[PB80-125891] N80-23869

FLIGHT CHARACTERISTICS
Flight safety of Rogallo hang gliders. Theoretical and experimental study of the flight envelope
[ONERA-NT-1979-8] N80-23301

FLIGHT CONTROL
Practical optimal flight control system design for helicopter aircraft. Volume 1: Technical Report
[NASA-CR-3275] N80-23328

FLIGHT SAFETY
Flight safety of Rogallo hang gliders. Theoretical and experimental study of the flight envelope
[ONERA-NT-1979-8] N80-23301

FLIGHT SIMULATION
Air combat maneuvering performance measurement
[AD-A077429] N80-23336

FLIGHT SIMULATORS
Operations manual: Vertical Motion Simulator (VMS) S.08
[NASA-TM-81180] N80-23295
NAVAIRDEVCEN dynamic flight simulator design and multipurpose crew station concept design and development plan
[AD-A081982] N80-23335

FLIGHT TESTS
Carburetor ice: A review
[TR-79-9] N80-23279
A flight investigation of system accuracies and operational capabilities of a general aviation/air transport area navigation system (RNAV)
[AD-A081646] N80-23288
Flight test evaluation of airborne tire pressure indicating systems
[AD-A081598] N80-23305

FLIGHT TRAINING
Platform motion contributions to simulator training effectiveness. Study 3: Interaction of motion with field-on-view
[AD-A078426] N80-23334

FLIR DETECTORS
Field manual to determine detection or recognition range of a FLIR sensor
[AD-A081324] N80-24156

FLOATING
Floating nut retention system
[NASA-CASE-MSC-16936-1] N80-23863

FLORIDA
Solar hot water system installed at Quality Inn, Key West, Florida
[NASA-CR-161434] N80-23774

FLOW DISTRIBUTION
Leeward flow over delta wings at supersonic speeds
[NASA-TM-81187] N80-23250
Lee side flow for slender delta wings of finite thickness
[NASA-TM-75753] N80-23253
Numerical flow field program for aerodynamic heating analysis. Volume 2: User's manual
[AD-A081472] N80-23260
Finite element analysis of subsonic, transonic and supersonic flows around missiles
[AD-A077375] N80-23281
Channels that cooperatively service a data stream and voice messages. Part 2: Diffusion approximations
[AD-A081617] N80-23540
Shock-boundary layer interaction effects in transonic flow fields
[AD-A080889] N80-23601
On the interaction of wall jets and fountain formation
[AD-A081540] N80-23607
A primitive variable mathematical model for predicting the flows in turbojet test cells
[AD-A081539] N80-23611

FLOW MEASUREMENT
Turbulent transport phenomena — experimental measurement techniques
[AGARD-AR-150] N80-23620
Fuel consumption measurements-carbon balance versus flow meter
[PB80-128549] N80-24218

FLOW STABILITY
Stability of modulated rotating fluids — Galerkin method N80-23595
On Goertler instability
[AD-A081255] N80-23602

FLOW VELOCITY
Investigation of velocity field about a two dimensional plexiglass ogival foil using the laser doppler anemometer
[AD-A081765] N80-23639

FLOW VISUALIZATION
Interaction of two ring vortices with different translation axis and formation of new ring vortices from an oscillating ring vortex
[MPIS-2/1979] N80-23615

FLOWMETERS
Analysis of ultrasonic flowmeters for leak detection in liquid hydrocarbon pipelines
[AD-A081791] N80-24132

FLUID DYNAMICS
Interaction of two ring vortices with different translation axis and formation of new ring vortices from an oscillating ring vortex
[MPIS-2/1979] N80-23615

FLUID FILMS
Application of magnetic suspensions and fluid film bearings to energy storage flywheels
[SAND-79-7007] N80-23824

FLUID FLOW
Experiments with rotational symmetric supersonic free jets with laser-induced J2 fluorescence
[MPIS-7/1979] N80-23616
Rhythmic vortex currents and their significance in human physiology
[MPIS-1/1979] N80-23982

FLUID MECHANICS
Theoretical investigation of stationary stellar systems in the Brans-Dicke theory of gravitation, with applications to perfect fluid interiors — by modifying theory of relativity N80-24225

FLUID PRESSURE
Theoretical and experimental studies on the dielectric and optical properties of fluids under high pressure N80-23389

FLUORESCENCE
Application of laser-induced fluorescence for measuring reaction rate constants in H-N-C-O systems
[MPIS-13/1979] N80-23408
Experiments with rotational symmetric supersonic free jets with laser-induced J2 fluorescence
[MPIS-7/1979] N80-23616
Medium effects of fluorescence quantum yields and lifetimes for coumarin laser dyes
[AD-A081748] N80-23640
Multiquantum ultraviolet excitation of atoms and molecules N80-24135

FLUORIDES
Fluoride measurements in southern Netherlands. Measurements at Delft, Naaldwijk and Maasland during 1977
[IG-TNO-G-799] N80-23896

FLUOROPOLYMERS
Structure modification of fluorocarbon ether bibenzoxazole polymers to improve hydrolytic stability
[AD-A078954] N80-23466

FLUTTER
An aeroelastic analysis of the Sheriff wing
[BU-234] N80-23274
Comparative measurements in four European wind tunnels of the unsteady pressures on an oscillating model
[AGARD-R-673] N80-23338
Status of NASA full-scale engine aeroelasticity research
[NASA-TM-81500] N80-23678
Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance
[NASA-TM-81818] N80-23683

FLUX DENSITY
Laminated composite disc flywheel development
[UCRL-15154] N80-23843
Gas and aerosol fluxes — emphasizing sulfur, nitrogen, and carbon N80-23959

FLY BY WIRE CONTROL
Definition of a two-level control system for nonlinear motion of an aircraft
[ESA-TT-614] N80-23330

FLYWHEELS
Magnetic bearing support study for a 10 kW-hr energy storage flywheel
[SAND-79-7025] N80-23861
Application of magnetic suspensions and fluid film bearings to energy storage flywheels
[SAND-79-7007] N80-23824
Oak Ridge Flywheel Evaluation Laboratory
[Y-2210] N80-23832
Laminated composite disc flywheel development
[UCRL-15154] N80-23843

FOAMS
Investigation of a foam supported glass fiber D-box for a rigid wing hang glider
[BU-240] N80-23302
The effect of foamed hard plastic stiffeners on aluminum shear webs
[BU-237] N80-23707

FOG
Deformation of the marine inversion and the development of marine fog and stratus resulting from warm water patches, numerical modeling and verification with satellite imagery
[AD-A081099] N80-23940

FOLDING STRUCTURES
The Mugsat magnetometer boom N80-23517

FORESTS
Nationwide forestry applications program: Corrections to forest reflectance as a function of low Sun angle and slope — Washington County, Missouri
[E80-10100] N80-23727
Integrated surveys of the natural resources in the Amazonia National Park (Topajos) based on LANDSAT images — Brazil
[E80-10109] N80-23736
Role of Temperate Zone Forests in the World Carbon Cycle: Problem definition and Research Needs — conferences
[DOE/ET/10040-1] N80-23883

FORMALDEHYDE
Rate constant for the reaction of hydroxyl radical with formaldehyde over the temperature range 228-362 K
[NASA-TM-80696] N80-23393
Comparative investigation into the reliability of various analysis methods for formaldehyde in air
[IG-TNO-F-1643] N80-23888

FORMALISM
The Roberson/Wittenburg formalism and the package MULTIBODY for computer simulations of multibody systems
[ESA-TT-557] N80-24097

FORMULATIONS
Applications of generalized derivatives to viscoelasticity
[AD-A081131] N80-23686

FORTRAN
A comparison of four FORTRAN routines for dense linear programs
[NPL-NACS-19/79] N80-24030
Complex arithmetic in FORTRAN
[NPL-NACS-23/79] N80-24031
FOSSIL FUELS
Regional application of fossil energy technologies: An analytical approach
[DOE/ET-2442-1] N80-23830
FOURIER ANALYSIS
Predictions of GPS X-Set performance during the places experiment
[AD-A081552] N80-23292
FRACTOGRAPHY
Quantitative fractography of a fatigued Ti-28 w/o V alloy
[AD-A079813] N80-23431
Hydrogen embrittlement in vanadium single crystals
[ISM-249] N80-23441
FRACTURE MECHANICS
Fracture and fragmentation of high energy propellant
[UCRL-15160] N80-23489
Shear lips on fatigue fractures in aluminum alloy sheet material
[LR-287] N80-23675
Evaluation of the round compact specimen for fatigue-crack growth rate testing
[HEDL-SA-1810] N80-23699
Dynamic fracture strength of oil shale and coal
[OUEL-1295/79] N80-23927
FRACTURE STRENGTH
The significance of the fatigue strength in the powder metallurgy
[ICAF-1134] N80-23676
Dynamic fracture strength of oil shale and coal
[OUEL-1295/79] N80-23927
FRACTURES (MATERIALS)
Thermal fracture effects in geothermal energy extraction --- computer programs
[LA-7963] N80-23795
FRAGMENTATION
Fracture and fragmentation of high energy propellant
[UCRL-15160] N80-23489
FREE CONVECTION
Thermal fracture effects in geothermal energy extraction --- computer programs
[LA-7963] N80-23795
FREE RADICALS
Preparation of polymers using metal-carbenes
[AD-A080891] N80-23458
FREQUENCY CONTROL
Research on the pertinent parameters of a quartz oscillator
[ONERA-NT-1979-10] N80-23588
FRICTION
Practical applications of surface analytic tools in tribology
[NASA-TM-81484] N80-23430
FRICTION REDUCTION
Damping in structural joints N80-23492
FUEL CELLS
Mass transport in molten-salt electrochemical systems
[ORNL/MIT-290] N80-23400
A primitive variable mathematical model for predicting the flows in turbojet test cells
[AD-A081539] N80-23611
Cell module and fuel conditioner development
[NASA-CR-159828] N80-23768
Cell module and fuel conditioner
[NASA-CR-159875] N80-23769
Molten carbonate fuel cell program. Composition gradients induced by current flow in Li2CO3-K2CO3 mixtures
[ORNL/TM-7061] N80-23839
Fuel cell systems for vehicular applications
[LA-UR-79-2826] N80-24214
Research, development, and demonstration of nickel-zinc batteries for electric vehicle propulsion --- electrode development program
[ANL/OEPM-78-10] N80-24215
FUEL CONSUMPTION
CF6 jet engine performance improvement: New fan
[NASA-CR-159699] N80-23309
Fuel consumption measurements-carbon balance versus flow meter
[PB80-128549] N80-24218
FUEL FLOW
Analysis of ultrasonic flowmeters for leak detection in liquid hydrocarbon pipelines
[AD-A081791] N80-24132
FUEL INJECTION
Electric fuel nozzles for combustors
[SAN/1442-79/T1] N80-23660
FUEL PRODUCTION
Carbohydrate crops as a renewable resource for fuels production. Volume 1: Agricultural research
[BMI-2031-VOL-1] N80-23481
FUEL TESTS
Carburetor ice: A review
[TR-79-9] N80-23279
FUEL VALVES
Fuel/hydraulic transfer valve improves reliability of Atlas space launch vehicle N80-23509
FUEL-AIR RATIO
Carburetor ice: A review
[TR-79-9] N80-23279
FUNCTIONAL ANALYSIS
Uniform linear approximation in normed linear spaces
[CSIR-TWISK-114] N80-24046
Expected number of vertices of a random convex polytope. I: Integral formula and asymptotic bounds
[AD-A080191] N80-24048
A nested partioning procedure for numerical multiple integration
[AD-A081070] N80-24061
FUNCTIONS (MATHEMATICS)
Finding the global minimum of a function of one variable using the method of constant signed higher order derivatives
[AD-A081491] N80-24005
FUNGI
The use of indigodisodiumdisulfonate to combat molds in ozone reagents
[IG-TNO-G-861] N80-23408
FUSELAGES
An analytical study of tilt proprotor aircraft dynamics in airplane cruise configuration including the effects of fuselage longitudinal rigid body motion
N80-23297
Investigations of the design of active vibration isolation systems for helicopters with rigid and elastic modeling of the fuselage
[ESA-TT-556] N80-23300
FUSION WELDING
Crystallography in fusion-weld-metal solidification mechanics N80-23429

G

GALACTIC EVOLUTION
Cosmology: Citations from the NTIS data base
[PB80-804818] N80-24231
GALERKIN METHOD
Stability of modulated rotating fluids --- Galerkin method N80-23595
Error bounds for exponentially fitted Galerkin methods applied to stiff two-point boundary value problems
[MC-NW-62/78] N80-24077
GALILEO PROJECT
Selenide isotope generator for the Galileo Mission: Copper/water axially-grooved heat pipe topical report
[TES-33009-44] N80-23829
GALLIUM ARSENIDES
Monolithic integration of microwave GaAs power FETs
[AD-A080793] N80-23574
Laser annealing of GaAs
[AD-A081466] N80-23637
Amphoteric gallium arsenide heteroface solar cells
N80-23765
Crystal growth of device quality GaAs in space
[NASA-CR-153190] N80-24185
Improvement in GaAs device yield and performance through substrate defect gettering
[AD-A081344] N80-24189
Liquid phase epitaxial growth of gallium arsenide
[AD-A081835] N80-24191
GAMMA RAYS
LASL gamma-ray burst astronomy program
[LA-UR-80-80] N80-24224
GAS ANALYSIS
Measuring techniques for NO2
[IG-TNO-G-852] N80-23899
GAS CHROMATOGRAPHY
Chelate-modified polymers for atmospheric gas chromatography
[NASA-CASE-ARC-11154-1] N80-23383
C2-C6 hydrocarbons in air: Gas chromatographic analysis of C2-C6 hydrocarbons in air using a concentrating technique
[IG-TNO-H-393] N80-23409
GC analysis aldehydes: Gas chromatographic analysis of C2-C5 alkanes in air using an isolation and concentration method based on bisulphate adduction formation
[IG-TNO-H-399] N80-23410
Computer programs for reducing mass spectra data from GC/MS systems
[PB80-133119] N80-23417
GAS DENSITY
Gladstone-Dale constant for CF4 --- experimental design
[NASA-TM-80228] N80-24151
GAS DETECTORS
Microwave spectrometer for the detection of transient gaseous species
[LBL-7293] N80-23403
GAS DYNAMICS
The split coefficient matrix method for hyperbolic systems of gasdynamic equations N80-23596
GAS FLOW
Test and evaluate the TRI-GAS low-Btu coal gasification process
[FE-2798-66] N80-23484
Design considerations of a flow system for transient laser discharge experiments
[AD-A080942] N80-23642
GAS MIXTURES
Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation
[LBL-9811] N80-24142
GAS TRANSPORT
Gas and aerosol fluxes --- emphasizing sulfur, nitrogen, and carbon N80-23959
GAS TURBINE ENGINES
Development of improved-durability plasma sprayed ceramic coatings for gas turbine engines
[NASA-TM-81512] N80-23313
Application of ceramic nozzles to 10 KW engine
[AD-A081184] N80-23320
Property screening and evaluation of ceramic turbine engine materials
[AD-A080963] N80-23322
Development of high temperature resistant ceramic parts for gas turbines
[BMFT-FB-T-79-09] N80-23324
GAS TURBINES
Conceptual design study of an improved gas turbine powertrain
[NASA-CR-159852] N80-23315
Development of high-temperature turbine subsystem technology to a technology readiness status, phase 2
[FE-1806-48] N80-23662
The effect of catalyst length and downstream reactor distance on catalytic combustor performance
[NASA-TM-81475] N80-23779
Summary of the research and development effort on open-cycle coal-fired gas turbines
[ORNL/TM-6253] N80-23821
GAS-METAL INTERACTIONS
A study of the hydrogen associated with supported and unsupported molybdenum oxide. 1: Molybdena-alumina catalysts. 2: Hydrogen molybdenum bronzes --- gas-metal interactions
N80-23385
Kinetic and thermodynamic studies of liquid metal-oxygen systems using solid state electrochemical techniques N80-23428
Metastable phenomena in hydrogen degradation of low carbon alloy steels
[EPRI-AF-1176] N80-23438
Hydrogen attack of steel
[COO-2872-04] N80-23439

Creep-rupture behavior of 2-1/4Cr-1 Mo steel, Alloy 800H and Hastelloy Alloy X in a simulated HTGR helium environment
[GA-A-15572] N80-23440

GASES
Gravimetric determination of gas sorption by means of an electronic micro-balance
[PNR-90009] N80-23407

GASOHOL (FUEL)
Retrospective search on the biochemical production of alcohol fuels
[NP-24137] N80-23476
Environmental assessment of the utilization of alcohol fuels in highway vehicle applications
[CONF-791009-19] N80-23477

GASOLINE
Conceptual design of a coal-to-methanol-to-gasoline commercial plant. Volume 3: Environmental
[FE-2416-43-VOL-3] N80-23485

GASTROINTESTINAL SYSTEM
Influence of experimental hypokinesia on gastric secretory function
[NASA-TM-76034] N80-23974

GATES (CIRCUITS)
An insulated-gate thyristor structure: Principles of operation and design N80-23560

GAUSS EQUATION
The mathematician Gauss, seen from the point of view of a space technologist --- Carl Friedrich Gauss
[TUM-LRT-KB-14/77] N80-23342

GEARS
Economical drive for large tube mills by means of planetary gears
[NASA-TM-75808] N80-23656
An analytical means for determination of scoring limited load capacity in sliding/rolling contact
[AD-A080984] N80-23657

GENERAL AVIATION AIRCRAFT
Emergency in-flight egress opening for general aviation aircraft --- pilot bailout N80-23511
A spin-recovery parachute system for light general-aviation airplanes N80-23512
Mathematical model for the separation of gust and manoeuvre loads of civil aircraft
[FB-141(1979)] N80-23674

GEOCHEMISTRY
Occurrence and mineral chemistry of high pressure phases, Portrillo basalt, southcentral New Mexico
[NASA-CR-153192] N80-23909

GEOCHRONOLOGY
Sm-Nd and Rb-Sr chronology of crustal formation. Part 1: Ba, Nd and Sm isotopic anomalies in the Allende meteorite, part 2 N80-24235

GEODETIC COORDINATES
Universal transverse Mercator grid tables for latitudes 0-80 degrees Clarke 1866 spheroid (meters). Volume 2: Transformation of coordinates from grid to geographic
[PB80-140411] N80-23763

GEODETIC SATELLITES
Applications of a dedicated gravitational satellite mission --- to study of oceanic circulation and earth structure
[AD-A076436] N80-23917

GEOGRAPHY
Universal transverse Mercator grid tables for latitudes 0-80 degrees Clarke 1866 spheroid (meters). Volume 2: Transformation of coordinates from grid to geographic
[PB80-140411] N80-23763

GEOLOGICAL SURVEYS
Study of geological structure of Sicily and other Italian areas --- Gulf of Orosei, East Sardinia
[E80-10108] N80-23735
Integrated surveys of the natural resources in the Amazonia National Park (Topajos) based on LANDSAT images --- Brazil
[E80-10109] N80-23736

GEOLOGY
Development of a three-dimensional seismic data acquisition and processing system
[BMFT-FB-T-79-22] N80-23921
Soil mechanical tests on Pacific deep sea sediments
[BMFT-FB-M-78-02] N80-23963

GEOMETRY
Geometric transforms for fast geometric algorithms
[AD-A081448] N80-24055

GEOMORPHOLOGY
LANDSAT reconnaissance images of the great soil region in the western part of the Paraiba Basin --- Brazil
[E80-10103] N80-23730
Integrated surveys of the natural resources in the Amazonia National Park (Topajos) based on LANDSAT images --- Brazil
[E80-10109] N80-23736

GEOPHYSICS
The frequency dependence of Q --- anelastic attenuation in the earth N80-23907
Further development of seismic methods. Three-dimensional migration/approximation procedure
[BMFT-FB-T-79-18] N80-23924

GEORGIA
Integrated use of LANDSAT data for state resource management --- Arizona, Georgia, North Dakota, and Texas
[E80-10095] N80-23722

GEOS 3 SATELLITE
Investigation of tidal displacements of the Earth's surface by laser ranging to GEOS-3
[NASA-CR-156863] N80-23908

GEOTHERMAL ENERGY CONVERSION
Energy from hot dry rock
[LA-UR-79-3256] N80-23802
Process applications for geothermal energy resources
[COO-4896-T1] N80-23854
Environmental development plan: Geothermal energy systems
[DOE/EDP-0036] N80-23877
Potential air quality impact of geothermal power production in the Imperial Valley
[UCRL-52797] N80-23878

GEOTHERMAL RESOURCES
Aqueous solutions database to high temperatures and pressures: NaCl solutions
[LBL-9621] N80-23399
Remote sensing for geothermal environmental assessments --- Imperial Valley and The Geysers, California
[UCRL-15108] N80-23756
Thermal fracture effects in geothermal energy extraction --- computer programs
[LA-7963] N80-23795

GERMANIUM
Density variation in the electron-hole liquid in stressed germanium and silicon
[LBL-8786] N80-24192

GERMANY
Application explorer mission A: Heat capacity mapping mission
[E80-10107] N80-23734
Federal Republic of Germany: Estimates of future energy/GDP relationships
[ORAU/IEA(M)-79-22] N80-23841
Psychological selection of Spacelab payload specialists. The evaluation of German applicants
[ESA-TT-586] N80-23987

GETTERS
Improvement in GaAs device yield and performance through substrate defect gettering
[AD-A081344] N80-24189

GIMBALS
A precision bearing gimbal system for the Teal Ruby program N80-23508
Ku band deployed assembly and gimbal N80-23510

GLASS
Program to study SIC fiber reinforced glass matrix composites
[AD-A077638] N80-23379
Comparative Raman study of mixed-alkali and similar ion exchanged glasses
[AD-A080640] N80-23463
Toward an understanding of the mechanical mixed alkali effect in glasses
[AD-A080751] N80-23464
Evaluation of NRL glass for fiber optics, phase 1 --- for use as waveguides
[AD-A081582] N80-24155

GLASS FIBERS
Investigation of a foam supported glass fiber D-box for a rigid wing hang glider
[BU-240] N80-23302

GLOBAL POSITIONING SYSTEM
Global Positioning Systems (GPS). Manpack/Vehicular User Equipment (MVUE), volume 1
[AD-A076482] N80-23289
Global Positioning Systems (GPS) High Dynamic User Equipment (HDUE). Volume 2: Set description
[AD-A076480] N80-23290
Global Positioning System (GPS) High Dynamic User Equipment (HDUE). Volume 3: Set description
[AD-A076481] N80-23291
Predictions of GPS X-Set performance during the places experiment
[AD-A081552] N80-23292
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2D: Specific study no. 4, gyro accuracy requirements in a strap down inertial navigation system with GPS aiding for RPV missions
[AGARD-AR-147-VOL-2D] N80-23294
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2A: Specific application study no. 1, close air support
[AGARD-AR-147-VOL-2A] N80-23303

GOES SATELLITES
Design of an atmospheric sounding radiometer for the GOES meteorological satellite system N80-23519

GOVERNMENTS
Earth resources data project
[E80-10092] N80-23719
LANDSAT's role in state coastal management programs --- New Jersey and Texas
[E80-10101] N80-23728
LANDSAT'S role in HUD 701 programs --- New Jersey and South Dakota
[E80-10102] N80-23729

GRAIN BOUNDARIES
Investigations into the grain refinement of copper N80-23420
Photovoltaic mechanisms in polycrystalline thins-film solar cells
[DSE/3412-T1] N80-23834

GRAINS (FOOD)
Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720

GRAPH THEORY
On the edge-coloring property for the hereditary closure of a complete uniform hypergraph 2
[MC-ZW-106/78] N80-24088
Vertex-critical subgraphs of Kneser-graphs
[MC-ZW-108/78] N80-24089
Solution of two fractional packing problems of Lovász
[MC-ZW-110/78] N80-24091
Combinatorial graph embedding
[AD-A081247] N80-24108

GRAPHITE
Room temperature curing resin systems for graphite/epoxy composite repair
[AD-A081738] N80-23373
Application of graphite/epoxy composites for the SPS-10 radar reflector
[AD-A077530] N80-23380
Oxygen reduction of a graphite paste and a catalyst loaded graphite paste electrode N80-23390

GRAPHITE-EPOXY COMPOSITE MATERIALS
Room temperature curing resin systems for graphite/epoxy composite repair
[AD-A081738] N80-23373
Ultrasonic nondestructive testing of materials --- graphite-epoxy and boron-epoxy composite materials
[AD-A078370] N80-23667
Visualization of impact damage of composite plates by means of the Moire technique
[NASA-CR-159261] N80-23679

GRAPHS (CHARTS)
The structure of minimal graphs with given abelian automorphism group N80-24042
Combinatorial graph embedding
[AD-A081247] N80-24108

GRASSES
Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720

Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748
Production of sugarcane and tropical grasses as a renewable energy source
[ORO-5912-T1] N80-23840

GRAVIMETRY
Gravimetric determination of gas sorption by means of an electronic micro-balance
[PNR-90009] N80-23407
Neutron-meter calibration for the 1978 Colby soil moisture experiment — Thomas County, Kansas
[E80-10120] N80-23746
Measuring techniques for NO2
[IG-TNO-G-852] N80-23899

GRAVITATION
Suggested experiments for momentum-free G-simulation using the Long Duration Exposure Facility (LDEF)
[TUM-LRT-KB-77/18] N80-23360

GRAVITATION THEORY
General perturbations theories derived from the 1965 lane drag theory
[AD-A081264] N80-23347
Theoretical investigation of stationary stellar systems in the Brans-Dicke theory of gravitation, with applications to perfect fluid interiors — by modifying theory of relativity N80-24225

GRAVITATIONAL FIELDS
Applications of a dedicated gravitational satellite mission — to study of oceanic circulation and earth structure
[AD-A076438] N80-23917

GRAVITATIONAL WAVES
Vacuum black hole gravitational wave cross sections N80-24220
Studies on gravitational waves and stars with neutron cores N80-24229

GRAVITY ANOMALIES
Gravity study of the Los Alamos area, New Mexico
[LA-8154-MS] N80-23920

GRAVITY WAVES
Internal gravity waves in the solar atmosphere N80-24238

GREAT PLAINS CORRIDOR (NORTH AMERICA)
Interpreting land use change through satellite imagery — Great Plains and Southeastern Alluvium Coast and Tidewater regions
[PB80-127277] N80-23764

GREEN WAVE EFFECT
Agricultural soil moisture experiment: 1978 Colby (Kansas) data catalog and documentation — Thomas County, Kansas
[E80-10098] N80-23725
Applicability of selected wheat remote sensing technology to corn and soybeans
[E80-10112] N80-23739
Processing techniques development, volume 2. Part 1: Crop inventory techniques — Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741

GRINDING (MATERIAL REMOVAL)
Method of forming a sharp edge on an optical device
[NASA-CASE-GSC-12346-1] N80-24149

GROUND TRUTH
Composition and assembly of a spectral data base for transition year spring wheat blind sites — North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747

GROUP THEORY
On a sufficient condition for the existence of G-compactifications
[MC-ZW-120/78] N80-24122

GULF OF MEXICO
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions — Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Whole basin model of the Gulf of Mexico
[CONF-790631-12] N80-23962

GULF STREAM
Study of geological structure of Sicily and other Italian areas — Gulf of Orosei, East Sardinia
[E80-10108] N80-23735

GUST ALLEVIATORS
Design, development and implementation of an active control system for load alleviation for a commercial transport airplane
[AGARD-AR-683] N80-23331

GUST LOADS
Gust severity effects on fatigue crack propagation in aluminum alloy sheet materials
[NLR-MP-78041-U] N80-23449
Mathematical model for the separation of gust and manoeuvre loads of civil aircraft
[FB-141(1979)] N80-23674

GYROSCOPES
Multioscillator laser gyro study
[AD-A081421] N80-23626
Passive ring resonator laser gyroscope
[AD-A081649] N80-23627
Gyro noise measurement and analysis
[NLR-TR-79077-U] N80-23635

H

HABITATS
The application of remote sensing technology to the solution of problems in the management of resources in Indiana — pheasant habitats in Benton County, soil mapping in Jasper County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23738

HANDBOOKS
Low temperature data handbook titanium and titanium alloys
[NPL-QU-53] N80-23448

HANG GLIDERS
Flight safety of Rogallo hang gliders. Theoretical and experimental study of the flight envelope
[ONERA-NT-1979-8] N80-23301
Investigation of a foam supported glass fiber D-box for a rigid wing hang glider
[BU-240] N80-23302

HARDENING (MATERIALS)
Electron beam melt-hardening of aluminum alloys
[BMFT-FB-T-79-20] N80-23446

HARMONIC OSCILLATION
The harmonically oscillating body in subsonic flow: Effect of compressibility
[ESA-TT-584] N80-23270

HARMONICS
General perturbations theories derived from the 1965 lane drag theory
[AD-A081264] N80-23347

HASTELLOY (TRADEMARK)
Creep-rupture behavior of 2-1/4Cr-1 Mo steel, Alloy 800H and Hastelloy Alloy X in a simulated HTGR helium environment
[GA-A-15572] N80-23440

HAWAII
Volcanic features of Hawaii. A basis for comparison with Mars
[NASA-SP-403] N80-23912
Hawaii wind power survey: Fixed station data
[UHMET-79-15] N80-23948

HAY
Variability of crop calendar stage dates — Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726

HAZARDS
Fire-resistant hydraulic fluids in enclosed marine environments
[PB80-125545] N80-23470

HEALTH PHYSICS
Proceedings of the Workshop on Electrical and Biological Effects Related to HVDC Transmission
[PNL-3121] N80-23979
Study of the possible effects of 110 kHz electromagnetic fields on humans
[SAND-77-7028] N80-23981

HEART
Positron emission tomography of the heart
[UCLA-12-1232] N80-23980

HEART DISEASES
Possibilities of forecasting hypercholesterinemia in pilots
[NASA-TM-76087] N80-23975

HEART FUNCTION
Coronary plexus in man and monkey N80-23971

HEART RATE
Pulse transducer with artifact signal attenuator — heart rate sensors
[NASA-CASE-FRC-11012-1] N80-23969

HEAT CAPACITY MAPPING MISSION
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions — Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Application explorer mission A: Heat capacity mapping mission
[E80-10107] N80-23734
Study of geological structure of Sicily and other Italian areas — Gulf of Orosei, East Sardinia
[E80-10108] N80-23735

HEAT EXCHANGERS
Potential heat exchange fluids for use in sulfuric acid vaporizers
[NASA-CASE-NPO-15015-1] N80-23394

HEAT PIPES
Selenide isotope generator for the Galileo Mission: Copper/water axially-grooved heat pipe topical report
[TES-33009-44] N80-23829

HEAT PUMPS
Fluid circulating pump operated by same incident solar energy which heats energy collection fluid N80-23500
Research and development of an air-cycle heat-pump water heater
[ORNL/SUB-7226/1] N80-23850
Performance improvement of a solar heating system utilizing off-peak electric auxiliary
[DOE/R5/10140-1] N80-23852
Series solar heat pump and energy conservation
[BNL-27012] N80-23857

HEAT SHIELDING
Room temperature mechanical properties of shuttle thermal protection system materials
[NASA-TM-81786] N80-23682

HEAT STORAGE
Solar applications of thermal energy storge
[TID-29430] N80-23791
Thermal energy storage in aquifers: Preliminary information
[PNL-3062] N80-23793
Developing and upgrading of solar system thermal energy storage simulation models
[BCS-40252] N80-23858

HEAT TRANSFER
Hypersonic heat transfer test program in the VKI longshot facility
[AD-A081467] N80-23257
Significance of thermal contact resistance in two-layer thermal-barrier-coated turbine vanes
[NASA-TM-81483] N80-23310
Two-phase working fluids for the temperature range of 50 to 350 deg, phase 2
[NASA-CR-159847] N80-23599
Natural convection heat transfer from an external receiver
[SAND-78-8276] N80-23612
Solar collector fluid parameter study
[PB80-125891] N80-23869
The turbulent fluxes of momentum and sensible heat over the open sea during moderate to strong winds
[AD-A081392] N80-23943

HEATING EQUIPMENT
Non-Concentrating collectors for solar heating applications (medium temperature air heaters based on durable transparent films)
[ALO-4147-T1] N80-23817
Off-peak electric auxiliary heat for solar air-heating systems
[COO-4516-1] N80-23827
MHD air heater development technology
[CONS-3005-T2] N80-23835
Research and development of an air-cycle heat-pump water heater
[ORNL/SUB-7226/1] N80-23850

HELICOPTER CONTROL
Navigation, guidance, and control for helicopter automatic landings
[NASA-TP-1649] N80-23326

HELICOPTERS
Decision analysis of Advanced Scout Helicopter candidates
[AD-A081483] N80-23298

Investigations of the design of active vibration isolation systems for helicopters with rigid and elastic modeling of the fuselage
[ESA-TT-556] N80-23300
Practical optimal flight control system design for helicopter aircraft. Volume 1: Technical Report
[NASA-CR-3275] N80-23328

HELIOSTATS
Heliostat design cost/performance tradeoffs
[SAND-79-8248] N80-23806
Preliminary design report: New ideas for heliostat reflector cleaning systems
[SAND-79-8181] N80-23809
Non-inverting heliostat study
[SAND-78-8190] N80-23819

HELIUM
HEROP: A computer program for the thermodynamic and thermophysical properties of helium, third edition
[OUEL-1289/79] N80-23413
Creep-rupture behavior of 2-1/4Cr-1 Mo steel, Alloy 800H and Hastelloy Alloy X in a simulated HTGR helium environment
[GA-A-15572] N80-23440
Helium abundances in young clusters and associations N80-24227

HETEROJUNCTION DEVICES
Solar cell heterojunctions involving N-cadium sulfide and certain P-type semiconductor single crystals N80-23766

HEURISTIC METHODS
Analysis of heuristics for sequencing jobs on one machine with release dates and delivery times
[MC-BW-95/78] N80-24072

HIGH ENERGY PROPELLANTS
Fracture and fragmentation of high energy propellant
[UCRL-15160] N80-23489

HIGH PASS FILTERS
Synthesis of optimal filters using microcomputers
[AD-A081045] N80-23995

HIGH PRESSURE
Cooling of high pressure rocket thrust chambers with liquid oxygen
[NASA-TM-81503] N80-23365
Aqueous solutions database to high temperatures and pressures: NaCl solutions
[LBL-9621] N80-23399
High pressure noble gas alkali vapor mixtures and their visible and infrared excimer bands
[AD-A081808] N80-23643
Laser-driven shockwave experiments at extreme high pressures --- determining equation of state data
[UCRL-83372] N80-23649
Development of a rotary high pressure displacement pump for reversed osmosis systems for seawater desalination
[BMFT-FB-M-78-08] N80-23663

HIGH RESOLUTION
A polarimeter for the high resolution ultraviolet spectrometer/polarimeter --- Solar Maximum Mission N80-23520
High resolution optical ranging system N80-24150

HIGH SPEED CAMERAS
A simple camera system for photography of projectiles in flight under daylight conditions
[PHL-1978-51] N80-23634

HIGH TEMPERATURE
High-temperature mechanical properties of sintered alpha silicon carbide (13 October 1978 - 13 October 1979)
[AD-A081824] N80-23375
Aqueous solutions database to high temperatures and pressures: NaCl solutions
[LBL-9621] N80-23399
Processing mechanisms, structure and morphology of high temperature polymeric alloys, part 2
[AD-A080088] N80-23457
Development of high temperature silicone base fire-resistant hydraulic fluid
[AD-A081597] N80-23459
Natural convection heat transfer from an external receiver
[SAND-78-8276] N80-23612
Assessment of current high-temperature strain gages
[ORNL/TM-7025] N80-23632

HIGH TEMPERATURE GAS COOLED REACTORS
Creep-rupture behavior of 2-1/4Cr-1 Mo steel, Alloy 800H and Hastelloy Alloy X in a simulated HTGR helium environment
[GA-A-15572] N80-23440

HIGH TEMPERATURE GASES
Summary of the research and development effort on open-cycle coal-fired gas turbines
[ORNL/TM-6253] N80-23821

HIGH TEMPERATURE TESTS
Development of high-temperature turbine subsystem technology to a technology readiness status, phase 2
[FE-1806-48] N80-23662

HILBERT SPACE
Regularization and generalized inverse solutions of integral equations of the first kind in reproducing kernel Hilbert spaces
[CSIR-TWISK-88] N80-24118

HISTIDINE
Relationship between urinary 3-methylhistidine excretion and components of body composition in man N80-23972

HMX
Performance and properties of extrusion cast explosives composed of HMX, FEFO and AFNOL
[UCID-18333] N80-23479

HOLDERS
Method and apparatus for holding two separate metal pieces together for welding
[NASA-CASE-GSC-12318-1] N80-23655
Project filter holder. Tests on 25 mm dust filter holders
[IG-TNO-F-1638] N80-23887

HOLES (ELECTRON DEFICIENCIES)
Density variation in the electron-hole liquid in stressed germanium and silicon
[LBL-8786] N80-24192

HOLOGRAPHIC INTERFEROMETRY
Improving a real time acoustical holographic system for flaw detection
[AD-A080918] N80-23625

HONEYCOMB CORES
Comparison of structural behavior of superplastically formed/diffusion-bonded sandwich structures and honeycomb core sandwich structures
[NASA-TM-81348] N80-23685

HORIZONTAL ORIENTATION
Field manual to determine detection or recognition range of a FLIR sensor
[AD-A081324] N80-24156

HORN ANTENNAS
Dual band combiner for horn antenna
[NASA-CASE-NPO-14519-1] N80-23524

HOSES
Solar energy systems: Standards for rubber hose
[PB80-129828] N80-23868

HOT-WIRE ANEMOMETERS
Critical comparison of hot-wire anemometry and laser doppler velocimetry for I.C. engine applications
[SAND-79-8685] N80-23584

HUMAN BODY
Rhythmic vortex currents and their significance in human physiology
[MPIS-1/1979] N80-23982

HUMAN FACTORS ENGINEERING
Study of the possible effects of 110 kHz electromagnetic fields on humans
[SAND-77-7028] N80-23981
Preparation cost and dual-task performance: Further evidence against a general time-sharing factor
[AD-A080857] N80-23986
NASA authorization, 1981
[GPO-59-528] N80-24211

HUMAN PERFORMANCE
Preparation cost and dual-task performance: Further evidence against a general time-sharing factor
[AD-A080857] N80-23986

HUMAN RESOURCES
A computer simulation of organizational decision-making
[AD-A081600] N80-24202

HUMIDITY
Passive intrusion detection system
[NASA-CASE-NPO-13804-1] N80-23559

HYBRID PROPELLANT ROCKET ENGINES
Cost analysis of the propulsion of a payload transfer module for shuttle/Spacelab applications on the basis of hybrid rocket engines
[TUM-LRT-KB-77/19] N80-23368

HYDRAULIC EQUIPMENT
Fuel/hydraulic transfer valve improves reliability of Atlas space launch vehicle N80-23509

HYDRAULIC FLUIDS
Development of high temperature silicone base fire-resistant hydraulic fluid
[AD-A081597] N80-23459
Fire-resistant hydraulic fluids in enclosed marine environments
[PB80-125545] N80-23470

HYDRIDES
Hydrogen storage materials research and development work at Brookhaven National Laboratory
[BNL-26813] N80-23478

HYDROCARBON COMBUSTION
Formation of prompt nitrogen oxides during combustion of hydrocarbons
[ESA-TT-579] N80-23411

HYDROCARBON FUEL PRODUCTION
Energy from in situ processing of Antrim oil shale
[FE-2346-49] N80-23808

HYDROCARBON FUELS
Research on diamantane and other high density
[AD-A080749] N80-23474

HYDROCARBONS
Examination of the reactions of O+ with CH4, C2H4, C2H6, C3H8 and N+ with CO by measurement of the luminescence and the translational energy of the product ions
[MPIS-9/1979] N80-23405
Application of laser-induced fluorescence for measuring reaction rate constants in H-N-C-O systems
[MPIS-13/1979] N80-23406
C2-C6 hydrocarbons in air: Gas chromatographic analysis of C2-C6 hydrocarbons in air using a concentrating technique
[IG-TNO-H-393] N80-23409
Source assessment: Chlorinated hydrocarbons manufacture --- pollution monitoring
[PB80-138209] N80-23418
Spatial variability of ozone and other pollutants at St. Louis, Missouri
[PB80-132830] N80-23930

HYDRODYNAMICS
A higher order surface singularity method for the axisymmetric inverse problem
[AD-A081797] N80-23604

HYDROELASTICITY
Hydroelastic oscillations of smooth and rough cylinders in harmonic flow
[AD-A081760] N80-23606

HYDROGEN
A study of the hydrogen associated with supported and unsupported molybdenum oxide. 1: Molybdena-alumina catalysts. 2: Hydrogen molybdenum bronzes --- gas-metal interactions N80-23385
Electro-oxidation of hydrogen and propane in strong organic acid electrolytes N80-23392
A surface analysis study of carbon monoxide and hydrogen absorption and desorption of Ni(3) crystals --- catalytic reactivity N80-23425
Multiquantum ultraviolet excitation of atoms and molecules N80-24135
The effects of hydrogen content on reactively sputtered amorphous silicon films N80-24182

HYDROGEN CHLORIDES
Effect of hydrogen chloride on the morphology of Bacillus subtilis spores N80-23967
Sterilization by means of hydrogen chloride: Influence of process parameters on the biocidal activity N80-23968

HYDROGEN EMBRITTLEMENT
Metastable phenomena in hydrogen degradation of low carbon alloy steels
[EPRI-AF-1176] N80-23438
Hydrogen attack of steel
[COO-2872-04] N80-23439
Hydrogen embrittlement in vanadium single crystals
[ISM-249] N80-23441

HYDROGEN FUELS
Fixed site hydrogen storage. 1: Applications impact
[SAND-79-8647] N80-23797

HYDROGEN IONS
Negative-hydrogen-ion production by backscattering from alkali-metall targets
[LBL-9992] N80-24144

HYDROGEN PRODUCTION
Potential heat exchange fluids for use in sulfuric acid vaporizers
[NASA-CASE-NPO-15015-1] N80-23394
Development of the steam-iron process for hydrogen production
[FE-2435-39] N80-23483

HYDROGEN-BASED ENERGY
Hydrogen storage materials research and development work at Brookhaven National Laboratory
[BNL-26813] N80-23478
Fixed site hydrogen storage. 1: Applications impact
[SAND-79-8647] N80-23797

HYDROGEOLOGY
LANDSAT reconnaissance images of the great soil region in the western part of the Paraiba Basin --- Brazil
[E80-10103] N80-23730

HYDROLOGY
Hydrologic evaluation of the stormflow generation process on a forested watershed --- Pennsylvania
N80-23713
Report of the Climate Data Management Workshop --- conferences
[PB80-126226] N80-23955

HYDROLYSIS
Structure modification of fluorocarbon ether bibenzoxazole polymers to improve hydrolytic stability
[AD-A078954] N80-23466

HYDROMETALLURGY
Determination and estimation of ionic activities of metal salts in water
[PB80-112212] N80-23416

HYDROXYL RADICALS
Rate constant for the reaction of hydroxyl radical with formaldehyde over the temperature range 228-362 K
[NASA-TM-80666] N80-23393

HYPERBOLAS
Hyperbolic fits to time-of-arrival sound ranging measurements
[AD-A080746] N80-24130

HYPERBOLIC FUNCTIONS
The split coefficient matrix method for hyperbolic systems of gasdynamic equations N80-23596
Hyperbolic fits to time-of-arrival sound ranging measurements
[AD-A080746] N80-24130

HYPERGEOMETRIC FUNCTIONS
Jacobi functions: The addition formula and the positivity of the dual convolution structure
[MC-TW-177/78] N80-24085
A fractional integral operator corresponding to negative powers of a certain second order differential operator
[MC-TW-182/78] N80-24086

HYPERSONICS
Hypersonic heat transfer test program in the VKI longshot facility
[AD-A081467] N80-23257
Measured and predicted shock shapes and aerodynamic coefficients for blunted cones at incidence in air at Mach 5.9
[NASA-TP-1652] N80-23600

HYPOKINESIA
Influence of experimental hypokinesia on gastric secretory function
[NASA-TM-76034] N80-23974

HYPOTHERMIA
An experimental evaluation of selected rewarming therapies for the treatment of profound accidental hypothermia, part 2
[AD-A078292] N80-23978

HYPOTHESES
The efficiency of three tests for linear hypotheses concerning two probabilities
[MC-SW-62/78] N80-24084

I

ICE
Conduct of cloud spectra measurements
[AD-A081127] N80-23914

ICE FORMATION
Carburetor ice: A review N80-23278
Carburetor ice: A review
[TR-77-19] N80-23280
Ice crystal growth in a dynamic thermal diffusion chamber
[NASA-TP-1651] N80-23934

ICE PREVENTION
Carburetor ice: A review N80-23278
Carburetor ice: A review
[TR-79-9] N80-23279
Carburetor ice: A review
[TR-77-19] N80-23280

IDAHO
Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721

ILLINOIS
Evaluation of several schemes for classification of remotely sensed data: Their parameters and performance --- Foster County, North Dakota; Grant County, Kansas; Iroquois County, Illinois, Tippecanoe County, Indiana; and Pottawattamie and Shelby Counties, Iowa
[E80-10105] N80-23732
Processing techniques development, volume 2. Part 1: Crop inventory techniques --- Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741

IMAGE PROCESSING
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Sybsystem (RSIS): User's guide
[E80-10088] N80-23715
A method for classifying multispectral remote sensing data using context --- Williston, North Dakota and Grand Rapids, Michigan
[E80-10089] N80-23716
Operations manual for the LANDSAT Imagery, Verification and Extraction System (LIVES)
[E80-10090] N80-23717
Users manual for the LANDSAT Imagery Verification and Extraction System (LIVES)
[E80-10091] N80-23718
Processing techniques development, volume 3. Part 2: Data preprocessing and information extraction techniques
[E80-10115] N80-23742
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
Automation in photogrammetry --- use of digital image processing technology
[AD-A081562] N80-23750
Applications of digital display in photointerpretation and digital mapping
[AD-A081091] N80-23751
Digital screening and halftone techniques for raster processing
[AD-A081090] N80-23753
Remote sensing for geothermal environmental assessments --- Imperial Valley and The Geysers, California
[UCRL-15108] N80-23756
Classification of multispectral remote sensing data
[ESA-TT-571] N80-23762
Implementation, interpretation and analysis of a suboptimal boundary finding algorithm
[AD-A081484] N80-24053
Algorithms for testing convexity of digital polygons
[AD-A081476] N80-24057

IMAGING TECHNIQUES
Visually Coupled System: Computer Generated Imagery (VCS-CGI) engineering interface
[AD-A080931] N80-23306
Technologies of imaging for communication terminals
[BMFT-FB-T-79-38] N80-23554
Two-dimensional Kalman filtering and its application to image restoration N80-23561
Positron emission tomography of the heart
[UCLA-12-1232] N80-23980
Signal processing for higher frequency ultrasonic imaging N80-24125

IMPACT
Studies of impact cratering processes N80-24233

IMPACT DAMAGE
Visualization of impact damage of composite plates by means of the Moire technique
[NASA-CR-159261] N80-23679
Studies of impact cratering processes N80-24233

IMPACT PREDICTION
Determination of boundaries for kinematic intercept regions and evaluation of the miss distance for Line-Of-Sight (LOS)-guided missiles
[DFVLR-FB-79-13] N80-23354

IMPACT TESTS
Response of infrared-transparent materials to raindrop impacts --- zinc sulfides
[AD-A081542] N80-23374

IMPEDANCE MATCHING
A high power inductively coupled plasma torch and impedance matching network
[AD-A080906] N80-24166

IMPERIAL VALLEY (CA)
Remote sensing for geothermal environmental assessments --- Imperial Valley and The Geysers, California
[UCRL-15108] N80-23756

IMPURITIES
Analysis of the effects of impurities in silicon
[NASA-CR-163133] N80-23772
Effects of impurity radiation on reversed-field pinch evolution N80-24164

INCOMPRESSIBLE FLOW
A class of compressible partial differential equations related to the incompressible Navier-Stokes equation
N80-23597

INDENTATION
The indentation of an elastic layer by a rigid stamp under conditions of complete adhesion
[MC-TW-181/78] N80-23703

INDIANA
Evaluation of several schemes for classification of remotely sensed data: Their parameters and performance --- Foster County, North Dakota; Grant County, Kansas; Iroquois County, Illinois, Tippecanoe County, Indiana; and Pottawattamie and Shelby Counties, Iowa
[E80-10105] N80-23732
The application of remote sensing technology to the solution of problems in the management of resources in Indiana --- pheasant habitats in Benton County, soil mapping in Jasper County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23738
Processing techniques development, volume 2. Part 1: Crop inventory techniques --- Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741

INDIUM
Kinetic and thermodynamic studies of liquid metal-oxygen systems using solid state electrochemical techniques. N80-23428

INDIUM ANTIMONIDES
Investigation of laser optical biasing on the quantum transport properties of n-InSb
[AD-A081578] N80-23644

INDIUM COMPOUNDS
Properties of sputtered ITO/CdTe solar cells
N80-23767

INDIUM PHOSPHIDES
Electronic processes in InP and related compounds --- measurement of ionization coefficients and the epitaxial growth of InP
[AD-A080802] N80-24188

INDUSTRIAL ENERGY
Solar production of industrial process steam ranging in temperature from 300 deg F to 550 deg F, phase 1. Volume 3: Appendices (cont)
[DOE/CS-32199-3] N80-23812
Solar production of industrial process steam ranging in temperature from 300 degrees F to 550 degrees F, phase 1. Volume 2: Appendices
[DOE/CS-32199-2] N80-23813
Preliminary definition and characterizations of solar industrial process heat technology and manufacturing plant for the year 2000
[LA-UR-79-2812] N80-23820
Application of shallow solar ponds for industrial process heat: Case histories
[UCRL-82367] N80-23822

Process applications for geothermal energy resources
[COO-4896-T1] N80-23854
Analysis and design of a 100-kilowatt solar photovoltaic flat-panel power system for a machining and metalworking facility in Columbus, Ohio. Phase 1: Photovoltaic flat panel application experiment
[DOE/ET/23055-1] N80-23860

INEQUALITIES
Determining feasibility of a set of nonlinear inequality constraints
[AD-A081802] N80-24054
Inequalities in discrete distributions
[MC-SW-56/78] N80-24080

INERTIAL FUSION (REACTOR)
Fabrication and characterization of cryogenic targets for inertial confinement fusion
[UCRL-15113] N80-24170

INERTIAL NAVIGATION
Study of high-altitude radar altimeter model accuracy and SITAN performance using HAAFT data
[SAND-79-1380] N80-23307

INERTIAL PLATFORMS
Improved packaging for the LN-31 inertial measurement unit (F-15 aircraft)
[AD-A081745] N80-23293

INFORMATION DISSEMINATION
Technical information dissemination plan for the US Department of Energy, ETS/Solar Divisions
[SERI/SP-69-071] N80-24205

INFORMATION MANAGEMENT
Space transportation system western launch site construction management information system: A case study
[AD-A077675] N80-23358
DTIC cataloging guidelines
[AD-A080800] N80-24204

INFORMATION RETRIEVAL
How to gain access to information on science and technology for development from data bases via computer telecommunications
[PB80-133143] N80-24209

INFORMATION SYSTEMS
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Sybsystem (RSIS): User's guide
[E80-10088] N80-23715
Earth resources data project
[E80-10092] N80-23719
Integrated use of LANDSAT data for state resource management --- Arizona, Georgia, North Dakota, and Texas
[E80-10095] N80-23722
Texas Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Unival software user's guide
[E80-10096] N80-23723
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Acceptance test procedures
[E80-10097] N80-23724
LANDSAT'S role in HUD 701 programs --- New Jersey and South Dakota
[E80-10102] N80-23729
Agricultural scene understanding and supporting field research, volume 1
[E80-10113] N80-23740
World Energy Data System (WENDS). Volume 6: International agreement profiles
[ANL-PMS-79-2-VOL-6] N80-23790
DTIC cataloging guidelines
[AD-A080800] N80-24204
Technical information dissemination plan for the US Department of Energy, ETS/Solar Divisions
[SERI/SP-69-071] N80-24205
System requirements analysis for the Chemical Structure and Nomenclature System (CSNS)
[PB80-105216] N80-24207
Honeywell information systems MULTICS version 4.1
[PB80-126071] N80-24208
How to gain access to information on science and technology for development from data bases via computer telecommunications
[PB80-133143] N80-24209

INFORMATION THEORY
Clarification process: Resolution of decision-problem conditions
[NASA-TM-81193] N80-23985
A comparison of bounds of Delsarte and Lovasz
[MC-ZW-118/78] N80-24026
Sampling representations and approximations for certain functions and stochastic processes
[AD-A081533] N80-24102

INFRARED ABSORPTION
High pressure noble gas alkali vapor mixtures and their visible and infrared excimer bands
[AD-A081808] N80-23643

INFRARED ASTRONOMY
Ground-based measurements of sources in the AFGL infrared sky survey --- using astronomical photometry
[AD-A081381] N80-24222

INFRARED DETECTORS
The 3-V heterostructure avalanche photodiode modules for fiber optic communication links in the 1.0 to 1.3 micrometer spectral range
[AD-A081747] N80-23542
Passive infrared surveillance. Part 2: Threshold-crossing receivers
[AD-A081723] N80-24159
InGaAsP quarternary materials for near infrared detector and laser applications
[AD-A078320] N80-24187

INFRARED FILTERS
Efficient adaptive FIR and IIR Filters
[AD-A081605] N80-24158

INFRARED IMAGERY
Operations manual for the LANDSAT Imagery, Verification and Extraction System (LIVES)
[E80-10090] N80-23717

INFRARED PHOTOGRAPHY
Remote sensing of aquatic plants --- Lake Marion, South Carolina, Lake Seminole, Florida, Ross Barnett Reservoir, Mississippi, and Lake Boeuf and Lake Theriot, Louisiana
[AD-A081737] N80-23754

INFRARED RADIOMETERS
Mechanisms of UK radiometers flown on Nimbus 5 and 6 with particular reference to bearings, pivots and lubrication N80-23505
Design of an atmospheric sounding radiometer for the GOES meteorological satellite system N80-23519
The measurement of the transmission and the emission of the atmosphere by an infrared teleradiance meter
[PHL-1978-50] N80-23923
Radiometric measurements by the MIDAS 3 system at Key West. Volume 1: Cloud backgrounds
[AD-A081052] N80-23937

INFRARED SCANNERS
The mechanisms of the SAMS experiment flown on Nimbus 7 with particular reference to the 2 axis scanning mirror --- infrared radiometer for stratospheric and mesospheric investigations N80-23522

INFRARED SPECTRA
Characterization of passive films using infrared and Raman spectroscopy
[AD-A081240] N80-23397
Computerized method for the generation of molecular transmittance functions in the infrared region
[AD-A081789] N80-24139

INFRARED SPECTROMETERS
Battery-powered, differential infrared absorption sensor for methane, ethane, and other hydrocarbons
[UCRL-83317] N80-23629

INFRARED SPECTROSCOPY
The identification of chromatographically separated fractions by Fourier transform infrared spectroscopy N80-23387

INFRARED STARS
Ground-based measurements of sources in the AFGL infrared sky survey --- using astronomical photometry
[AD-A081381] N80-24222

INFRARED WINDOWS
Response of infrared-transparent materials to raindrop impacts --- zinc sulfides
[AD-A081542] N80-23374

INJECTION
Jet injections for optimum mixing in pipe flow
[PB80-128960] N80-23619

INLET NOZZLES
Application of ceramic nozzles to 10 KW engine
[AD-A081184] N80-23320

INPUT/OUTPUT ROUTINES
A framework for the integration of graphics and pattern recognition
[MC-IW-96/78] N80-24021

INSOLATION
Status of insolation resource assessment in the Northeast
[NESEC-6] N80-23826

INSPECTION
Failure analysis in aviation
[NLR-MP-78028-U] N80-23284
The LASL nondestructive testing group
[LA-UR-79-3071] N80-23668

INSTRUMENT PACKAGES
Energetic particle studies: Instrumentation and analysis
[AD-A081714] N80-23350
The Magsat magnetometer boom N80-23517

INSULATION
Solar energy systems: Test methods for collector insulations
[PB80-132038] N80-23867
Assessment of potential exposure to friable insulation materials containing asbestos
[NASA-TM-81435] N80-23875

INSULATORS
Study of electronic transport and breakdown in thin insulating films
[AD-A081135] N80-24186

INTAKE SYSTEMS
Summary of the research and development effort on open-cycle coal-fired gas turbines
[ORNL/TM-6253] N80-23821

INTEGRAL EQUATIONS
The indentation of an elastic layer by a rigid stamp under conditions of complete adhesion
[MC-TW-181/78] N80-23703
A fractional integral operator corresponding to negative powers of a certain second order differential operator
[MC-TW-182/78] N80-24086
Regularization and generalized inverse solutions of integral equations of the first kind in reproducing kernel Hilbert spaces
[CSIR-TWISK-88] N80-24118

INTEGRAL TRANSFORMATIONS
Wiener-Hopf approaches to regulator, filter/observer, and optical coupler problems
[AD-A081489] N80-24049

INTEGRATED CIRCUITS
Technology for the monolithic integration of UHF devices
[BMFT-FB-T-79-13] N80-23553
Design of special-purpose VLSI chips: Example and opinions
[AD-A081451] N80-23567
Autoclave testing of plastic encapsulated 4001 CMOS integrated circuits
[AD-A081555] N80-23570
Monolithic integration of microwave GaAs power FETs
[AD-A080793] N80-23574
Latch-up control in CMOS integrated circuits
[SAND-79-1479C] N80-23583
Techniques for low noise and high power transistors in integrated circuits
[BMFT-FB-T-79-15] N80-23587

INTEGRATED ENERGY SYSTEMS
Cell module and fuel conditioner development
[NASA-CR-159828] N80-23768
Cell module and fuel conditioner
[NASA-CR-159875] N80-23769
Solar hot water system installed at Quality Inn, Key West, Florida
[NASA-CR-161434] N80-23774
Off-peak electric auxiliary heat for solar air-heating systems
[COO-4516-1] N80-23827
Performance improvement of a solar heating system utilizing off-peak electric auxiliary
[DOE/R5/10140-1] N80-23852
Series solar heat pump and energy conservation
[BNL-27012] N80-23857

Analysis and design of a 100-kilowatt solar photovoltaic flat-panel power system for a machining and metalworking facility in Columbus, Ohio. Phase 1: Photovoltaic flat panel application experiment
[DOE/ET/23055-1] N80-23860

INTELSAT 5 SATELLITE
The design and application of an antenna positioner mechanism for Intelsat-5 series communication satellite N80-23521

INTERFACIAL TENSION
Two-phase working fluids for the temperature range of 50 to 350 deg, phase 2
[NASA-CR-159847] N80-23599

INTERFEROMETERS
Noncontact, laser interferometer sweep gage
[Y-2190] N80-23631

INTERMETALLICS
Hydrogen storage materials research and development work at Brookhaven National Laboratory
[BNL-26813] N80-23478

INTERNAL COMBUSTION ENGINES
Critical comparison of hot-wire anemometry and laser doppler velocimetry for I.C. engine applications
[SAND-79-8685] N80-23584

INTERNATIONAL COOPERATION
Space research activities in Spain --- outlining Spanish space research N80-24212

INTERNATIONAL RELATIONS
World Energy Data System (WENDS). Volume 6: International agreement profiles
[ANL-PMS-79-2-VOL-6] N80-23790

INTERPOLATION
Interpolation for fragments of the propositional calculus
[MC-ZW-116/78] N80-24096

INTRUSION
Passive intrusion detection system
[NASA-CASE-NPO-13804-1] N80-23559

INVISCID FLOW
Development of perturbation procedures for nonlinear inviscid and viscous flows --- transonic flow
[AD-A081531] N80-23605

IODINE
Coherent Anti-Stokes Raman scattering at electronic resonance: Application to iodine
[ONERA-NT-1979-4] N80-23404

ION BEAMS
Intense ion beam applications to magnetic confinement fusion
[COO-4460-2] N80-24176

ION EXCHANGING
Comparative Raman study of mixed-alkali and similar ion exchanged glasses
[AD-A080840] N80-23463

ION IMPLANTATION
Development of pulsed processes for the manufacture of solar cells
[NASA-CR-153188] N80-23771
Development and fabrication of a solar cell junction processing system
[NASA-CR-153194] N80-23773
Model of the recrystallization mechanism of amorphous silicon layers created by ion implantation
[LBL-9990] N80-24196

ION PRODUCTION RATES
Negative-hydrogen-ion production by backscattering from alkali-metall targets
[LBL-9992] N80-24144

ION SOURCES
Study of the general plasma characteristics of a high power multifilament ion source
[LBL-8940] N80-24178

IONIC MOBILITY
Mass transport in molten-salt electrochemical systems
[ORNL/MIT-290] N80-23400
Determination and estimation of ionic activities of metal salts in water
[PB80-112212] N80-23416
Molten carbonate fuel cell program. Composition gradients induced by current flow in Li2CO3-K2CO3 mixtures
[ORNL/TM-7061] N80-23839

IONIZATION COEFFICIENTS
Electronic processes in InP and related compounds --- measurement of ionization coefficients and the epitaxial growth of InP
[AD-A080802] N80-24188

IONOSPHERE
Application of advanced computational procedures for modeling solar-wind interactions with Venus: Theory and computer code
[NASA-CR-3267] N80-24240

IONOSPHERIC DISTURBANCES
The physics of the photodeposition phase of the NRL master code for the disturbed E and F regions
[AD-A081776] N80-23916

IONOSPHERIC PROPAGATION
Development and evaluation of adaptive techniques for reducing ionospheric-induced radar tracking errors in real time
[AD-A081460] N80-23544

IONS
Ergodic orbits in particle simulations of strong ion rings
[AD-A081391] N80-24168
The effect of transport phenomena on electron velocity distribution functions and ion abundances in the solar chromosphere-corona transition region N80-24239

IOWA
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Evaluation of several schemes for classification of remotely sensed data: Their parameters and performance --- Foster County, North Dakota; Grant County, Kansas; Iroquois County, Illinois, Tippecanoe County, Indiana; and Pottawattamie and Shelby Counties, Iowa
[E80-10105] N80-23732
Processing techniques development, volume 2. Part 1: Crop inventory techniques --- Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741

IRON ALLOYS
Development of permanent magnet alloys
[BMFT-FB-T-79-23] N80-23443

IRRADIATION
Analysis of some laser light show effects for classification purposes
[PB80-131576] N80-23652
Thin film annealing by ion bombardment
[PB80-125677] N80-24198

IRRIGATION
Agricultural soil moisture experiment: 1978 Colby (Kansas) data catalog and documentation --- Thomas County, Kansas
[E80-10098] N80-23725

ISLAND ARCS
Comprehensive study of the seismotectonics of the eastern Aleutian arc and associated volcanic systems
[COO-3134-20] N80-23919

ISLANDS
Study of geological structure of Sicily and other Italian areas --- Gulf of Orosei, East Sardinia
[E80-10108] N80-23735

ISOTOPE EFFECT
Sm-Nd and Rb-Sr chronology of crustal formation. Part 1: Ba, Nd and Sm isotopic anomalies in the Allende meteorite, part 2 N80-24235

ITALY
Application explorer mission A: Heat capacity mapping mission
[E80-10107] N80-23734
Study of geological structure of Sicily and other Italian areas --- Gulf of Orosei, East Sardinia
[E80-10108] N80-23735

ITERATION
The strength of nonstationary ineration
[AD-A081450] N80-24120

ITERATIVE SOLUTION
Non-stationary Markov decision problems with converging parameters
[MC-BW-90/78] N80-24070
The application of iterated defect correction to the LOD method for parabolic equations
[MC-NW-58/78] N80-24075

J

JACOBI MATRIX METHOD
A numerical method to integrate Stiff systems of ordinary differential equations
[AD-A080998] N80-24063

JET AIRCRAFT
Radiometric measurements by the MIDAS 3 system at Key West. Volume 1: Cloud backgrounds
[AD-A081052] N80-23937

JET ENGINE FUELS
Carburetor ice: A review N80-23278
Carburetor ice: A review
[TR-79-9] N80-23279
The impact of fuels on aircraft technology through the year 2000
[NASA-TM-81492] N80-23472

JET ENGINES
CF6-6D engine short-term performance deterioration
[NASA-CR-159830] N80-23316

JET EXHAUST
Analysis of experiments on the effects of jet plumes on pressure distribution over a cylindrical afterbody at transonic speeds
[AD-A081647] N80-23259
Static calibration of a two-dimensional wedge nozzle with thrust vectoring and spanwise blowing
[NASA-TM-81161] N80-23317

JET FLOW
Analysis of experiments on the effects of jet plumes on pressure distribution over a cylindrical afterbody at transonic speeds
[AD-A081647] N80-23259
On the organized large-scale structure in a turbulent round jet and its far-field sound N80-23593
On the interaction of wall jets and fountain formation
[AD-A081540] N80-23607
Experiments with rotational symmetric supersonic free jets with laser-induced J2 fluorescence
[MPIS-7/1979] N80-23616

JET MIXING FLOW
Jet injections for optimum mixing in pipe flow
[PB80-128960] N80-23619
An investigation into the initial mixing and dilution of identical plumes from multiple stack configurations
[BU-233] N80-23902

JETTISONING
A spin-recovery parachute system for light general-aviation airplanes N80-23512

JOINTS (JUNCTIONS)
Damping in structural joints N80-23492
Study and analysis of a low cost cement bonded flat plate solar collector
[ALO-4122-T1] N80-23816

JOURNAL BEARINGS
Application of magnetic suspensions and fluid film bearings to energy storage flywheels
[SAND-79-7007] N80-23824

K

KALMAN FILTERS
Two-dimensional Kalman filtering and its application to image restoration N80-23561
The performance of a sampled data delay lock loop implemented with a Kalman loop filter
[AD-A081822] N80-23569

KANSAS
Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
Agricultural soil moisture experiment: 1978 Colby (Kansas) data catalog and documentation --- Thomas County, Kansas
[E80-10098] N80-23725
Sampling for area estimation: A comparison of full-frame sampling with the sample segment approach
[E80-10104] N80-23731
Evaluation of several schemes for classification of remotely sensed data: Their parameters and performance --- Foster County, North Dakota; Grant County, Kansas; Iroquois County, Illinois, Tippecanoe County, Indiana; and Pottawattamie and Shelby Counties, Iowa
[E80-10105] N80-23732

Neutron-meter calibration for the 1978 Colby soil moisture experiment --- Thomas County, Kansas
[E80-10120] N80-23746

KENTUCKY
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Processing techniques development, volume 2. Part 1: Crop inventory techniques --- Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741

KERNEL FUNCTIONS
On the stability of multistep formulas for Volterra integral equations of the second kind
[MC-NW-59/78] N80-24076

KINEMATICS
Vehicle-guideway interaction problems
N80-24255

KINESTHESIA
On the preservation of equilibrium in the orthograde and inverted positions of the body
[NASA-TM-76141] N80-23977

KRYPTON
Multiquantum ultraviolet excitation of atoms and molecules N80-24135

L

LAGRANGE MULTIPLIERS
A projected Lagrangian algorithm for nonlinear minimax optimization
[AD-A081069] N80-24018

LAKE ERIE
Comparison and verification of dynamical and statistical Lake Erie storm surge forecasts
[PB80-137797] N80-23954

LAKES
Remote sensing of aquatic plants --- Lake Marion, South Carolina, Lake Seminole, Florida, Ross Barnett Reservoir, Mississippi, and Lake Boeuf and Lake Theriot, Louisiana
[AD-A081737] N80-23754

LAMINAR FLOW
Laminar flow cyclone development program
[FE-3242-2] N80-23613

LAMINATES
Visualization of impact damage of composite plates by means of the Moire technique
[NASA-CR-159261] N80-23679
Interaction of large amplitude stress waves in layered elastic-plastic materials
[AD-A081429] N80-23691
Laminated composite disc flywheel development
[UCRL-15154] N80-23843

LAND MANAGEMENT
Voorne-Putten: A landscape-ecological survey --- Rhine delta, Netherlands
[REPT-4] N80-23761

LAND USE
Land use intensity and water quality --- of watersheds tributary to the Potomac River N80-23714
LANDSAT's role in state coastal management programs --- New Jersey and Texas
[E80-10101] N80-23728
LANDSAT'S role in HUD 701 programs --- New Jersey and South Dakota
[E80-10102] N80-23729
Voorne-Putten: A landscape-ecological survey --- Rhine delta, Netherlands
[REPT-4] N80-23761
Interpreting land use change through satellite imagery --- Great Plains and Southeastern Alluvium Coast and Tidewater regions
[PB80-127277] N80-23764
Report of the Climate Data Management Workshop --- conferences
[PB80-128226] N80-23955

LANDING
Estimation of wind shear and thrust loss during STOL aircraft landing approach N80-23296

LANGUAGE PROGRAMMING
Logical investigations on PTQ arising from programming requirements
[MC-ZW-117/78] N80-24025

LARGE AREA CROP INVENTORY EXPERIMENT
Interpretation of LANDSAT digital data using a cubic color model based on relative energies
[E80-10119] N80-23745
Composition and assembly of a spectral data base for transition year spring wheat blind sites --- North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747

LARGE SCALE INTEGRATION
Design of special-purpose VLSI chips: Example and opinions
[AD-A081451] N80-23567

LARGE SPACE STRUCTURES
A mechanical adapter for installing mission equipment on large space structures N80-23515
Automated beam builder N80-23516
EVA manipulation and assembly of space structure columns
[NASA-CR-3285] N80-23988

LASER ANEMOMETERS
Investigation of velocity field about a two dimensional plexiglass ogival foil using the laser doppler anemometer
[AD-A081765] N80-23639

LASER APPLICATIONS
Application of laser-induced fluorescence for measuring reaction rate constants in H-N-C-O systems
[MPIS-13/1979] N80-23406
Experiments with rotational symmetric supersonic free jets with laser-induced J2 fluorescence
[MPIS-7/1979] N80-23616
Dual-frequency Doppler-Lidar method of wind measurement
[AD-A080849] N80-23623
Laser annealing of GaAs
[AD-A081466] N80-23637
Program to investigate advanced laser processing of materials
[AD-A077573] N80-23646
Laser-driven shockwave experiments at extreme high pressures --- determining equation of state data
[UCRL-83372] N80-23649
Multiquantum ultraviolet excitation of atoms and molecules N80-24135
Scattering of low-energy electrons by laser excited sodium atoms in the 3 2P 3/2 state N80-24137
Laser annealing: Surface epitaxial crystallization, spatial variations measurement, dynamics of annealing and other applications N80-24181
InGaAsP quarternary materials for near infrared detector and laser applications
[AD-A078320] N80-24187

LASER CAVITIES
Multioscillator laser gyro study
[AD-A081421] N80-23626
Intracavity absorber effects in a CW dye laser
[COO-4448-2] N80-23647

LASER DOPPLER VELOCIMETERS
Critical comparison of hot-wire anemometry and laser doppler velocimetry for I.C. engine applications
[SAND-79-8685] N80-23584

LASER FUSION
Mechanical design for a large fusion laser system
[UCRL-82928] N80-23648
Elimination of defects in plasma polymerized films used in laser fusion targets
[UCID-18324] N80-24165
CECAM Workshop on Transport of Fast Electrons in Laser Fusion Plasmas
[LA-UR-79-3308] N80-24171

LASER HEATING
Investigation of laser optical biasing on the quantum transport properties of n-InSb
[AD-A081578] N80-23644

LASER OUTPUTS
Sinterable powers from laser driven reactions
[AD-A081709] N80-23460
Analysis of some laser light show effects for classification purposes
[PB80-131576] N80-23652

LASER PLASMAS
CECAM Workshop on Transport of Fast Electrons in Laser Fusion Plasmas
[LA-UR-79-3308] N80-24171

LASER PUMPING
Studies of laser selective excitation of atoms --- radiative lifetimes, plasma diagnostics, and vapor ionization
[UTIAS-229] N80-24146

LASER RANGE FINDERS
Application of laser ranging and VLBI data to a study of plate tectonic driving forces --- finite element method N80-23910

LASER RANGER/TRACKER
Investigation of tidal displacements of the Earth's surface by laser ranging to GEOS-3
[NASA-CR-156863] N80-23908

LASER TARGETS
Elimination of defects in plasma polymerized films used in laser fusion targets
[UCID-18324] N80-24165

LASER WELDING
Evaluation of basic laser welding capabilities
[AD-A077575] N80-23659

LASERS
Design considerations of a flow system for transient laser discharge experiments
[AD-A080942] N80-23642
Extension for increased data collection of quasi-homogeneous sources, addendum
[AD-A081557] N80-23645
Program to investigate advanced laser processing of materials
[AD-A077573] N80-23646
Direct solar pumped laser
[LA-7982-MS] N80-23651

LATCHES
Manned maneuvering unit latching mechanism
N80-23497
The actuated latch pin and its development
N80-23502

LATIN SQUARE METHOD
A lower bound for the length of partial transversals in a Latin square
[MC-ZW-109/78] N80-24090

LATITUDE
Universal transverse Mercator grid tables for latitudes 0-80 degrees Clarke 1866 spheroid (meters). Volume 2: Transformation of coordinates from grid to geographic
[PB80-140411] N80-23763

LEACHING
Process for the leaching of AP from propellant
[NASA-CASE-NPO-14109-1] N80-23471

LEAD (METAL)
Grids for maintenance-free storage batteries made from lead-akaline earth metal-alloys
[BMFT-FB-T-79-21] N80-23864

LEADING EDGE SLATS
Airplane wing leading edge variable camber flap
N80-23514

LEAST SQUARES METHOD
Evaluation of the round compact specimen for fatigue-crack growth rate testing
[HEDL-SA-1810] N80-23699
Linear least-squares analysis and effective interactions --- as applied to nuclear data
[UCRL-82587] N80-24064

LEE WAVES
Lee side flow for slender delta wings of finite thickness
[NASA-TM-75753] N80-23253

LENSES
Constant magnification optical tracking system
[NASA-CASE-NPO-14813-1] N80-24152

LIFE (DURABILITY)
Propellant surveillance report LGM-30 A and B stage 1, TP-H1011
[AD-A081493] N80-23475
Medium effects of fluorescence quantum yields and lifetimes for coumarin laser dyes
[AD-A081748] N80-23640
Liquid crystal displays of high reliability
[BMFT-FB-T-79-17] N80-24197

LIFT
On the interaction of wall jets and fountain formation
[AD-A081540] N80-23607

LIFT AUGMENTATION
Conceptual studies of a long-range transport with an upper surface blowing propulsive lift system
[NASA TM-81190] N80-23249

LIGHT (VISIBLE RADIATION)
Atmospheric Rayleigh scattering in the ultraviolet and visible spectral region
[ESA-TT-588] N80-23926

LIGHT AIRCRAFT
Wind tunnel tests on the Sheriff twin-engined light aircraft
[BU-241] N80-23277
LIGHT BEAMS
Constant magnification optical tracking system
[NASA-CASE-NPO-14813-1] N80-24152
LIGHT CURVE
Observations and analysis of four eclipsing binary systems N80-24219
Rapid oscillations in cataclysmic variables N80-24228
LIGHT SCATTERING
Investigation of velocity field about a two dimensional plexiglass ogival foil using the laser doppler anemometer
[AD-A081765] N80-23639
LIGHTNING
Rate statistics for radio noise from lightning
[NASA-TP-1665] N80-23933
LINE OF SIGHT COMMUNICATION
Performance of a very long 8 GHz microwave link
[PB80-129380] N80-23558
LINEAR ARRAYS
Transducer arrays suitable for acoustic imaging
[AD-A080970] N80-23579
LINEAR EQUATIONS
Separating variables in two-way diffusion equations
[PPPL-1596] N80-24066
Numerical treatment of linearized equations describing inhomogeneous collisionless plasmas
[LA-UR-79-2755] N80-24172
LINEAR FILTERS
Stochastic filtering theory: A discussion of concepts, methods, and results
[MC-EW-96/78] N80-24109
LINEAR PROGRAMMING
Solving staircase linear programs by the simplex method. 2. Pricing
[AD-A080838] N80-24003
Comments on Khachian's algorithm for linear programming
[AD-A080837] N80-24004
Automatic factorization of generalized upper bounds in large scale optimization problems
[AD-A081761] N80-24006
Automatic factorization of generalized upper bounds in large scale optimization models
[AD-A081614] N80-24017
A comparison of bounds of Delsarte and Lovasz
[MC-ZW-118/79] N80-24026
A comparison of four FORTRAN routines for dense linear programs
[NPL-NACS-19/79] N80-24030
Solving staircase linear programs by the simplex method. 1: Inversion
[AD-A081713] N80-24056
LINEAR SYSTEMS
Critical damping in linear discrete dynamic systems
[AD-A081085] N80-23686
LIQUEFIED NATURAL GAS
Battery-powered, differential infrared absorption sensor for methane, ethane, and other hydrocarbons
[UCRL-83317] N80-23629
LIQUID CRYSTALS
Liquid crystal displays of high reliability
[BMFT-FB-T-79-17] N80-24197
LIQUID METALS
Open-cycle coal-fired liquid-metal MHD
[CONF-790640-7] N80-23844
LIQUID OXYGEN
Cooling of high pressure rocket thrust chambers with liquid oxygen
[NASA-TM-81503] N80-23365
LIQUID PHASES
Liquid phase epitaxial growth of gallium arsenide
[AD-A081835] N80-24191
LIQUIDS
Measurement of the thickness of liquid film by means of capacitance method
[EPRI-NP-1212] N80-23614
LITHIUM
Mass transport in molten-salt electrochemical systems
[ORNL/MIT-290] N80-23400
LITHIUM ALLOYS
The effect of microstructure on the fatigue behavior of an aluminum-lithium alloy --- aluminum lithium manganese alloys N80-23424
LITHIUM COMPOUNDS
LiSi and LiB as anodes in chloroaluminate thermal batteries
[AD-A081300] N80-23784
LITHIUM FLUORIDES
Analysis of special components of the EUV-very wide angle camera
[BMFT-FB-W-79-04] N80-24160
LITHOLOGY
Study of geological structure of Sicily and other Italian areas --- Gulf of Orosei, East Sardinia
[E80-10108] N80-23735
LOAD TESTS
The effect of foamed hard plastic stiffeners on aluminum shear webs
[BU-237] N80-23707
LOADS (FORCES)
An investigation of loads on wedges placed in supersonic jets
[BU-235] N80-23275
An analytical means for determination of scoring limited load capacity in sliding/rolling contact
[AD-A080984] N80-23857
Application of laser ranging and VLBI data to a study of plate tectonic driving forces --- finite element method N80-23910
The Shock and Vibration Digest, volume 11, no.8
[AD-A073239] N80-24247
LOCKS (FASTENERS)
The actuated latch pin and its development N80-23502
LONG DURATION EXPOSURE FACILITY
Long Duration Exposure Facility (LDEF): A new multipurpose free-flying experiment carrier
[TUM-LRT-KB-77/17] N80-23359
Suggested experiments for momentum-free G-simulation using the Long Duration Exposure Facility (LDEF)
[TUM-LRT-KB-77/18] N80-23360
Drawer drive for space shuttle vacuum canister --- long duration exposure facility N80-23518
LONG TERM EFFECTS
Climatic changes from increased atmospheric carbon dioxide. Citations from the NTIS data base
[PB80-805427] N80-23953
LOOPS
Predictions of GPS X-Set performance during the places experiment
[AD-A081552] N80-23292
LOUISIANA
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
LOW ASPECT RATIO
Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance
[NASA-TM-81818] N80-23683
LOW FREQUENCIES
Current generation with low-frequency waves
[PPPL-1624] N80-23581
LOW NOISE
Low-noise wide-band amplifier system for stochastic beam cooling experiments
[LBL-9841] N80-23580
LOW TEMPERATURE
Low temperature data handbook titanium and titanium alloys
[NPL-QU-53] N80-23448
LUBRICANTS
Evaluation of the traction characteristics of three lubricants
[AD-A080968] N80-23658
LUBRICATION
Economical drive for large tube mills by means of planetary gears
[NASA-TM-75808] N80-23656
LUMINESCENCE
Examination of the reactions of O+ with CH4, C2H4, C2H6, C3H8 and N+ with CO by measurement of the luminescence and the translational energy of the product ions
[MPIS-9/1979] N80-23405
LUMINOSITY
History of the Sun's luminosity, 0 to 460,000 BP, based on the geologic record in light of recent climate theory
[UCRL-80972-REV-2] N80-24244
LUNAR CRATERS
Evolution of the early lunar crust: The role of impact melting, secondary cratering, and highland volcanism N80-24234
LUNAR CRUST
Evolution of the early lunar crust: The role of impact melting, secondary cratering, and highland volcanism N80-24234
LUNAR EVOLUTION
Evolution of the early lunar crust: The role of impact melting, secondary cratering, and highland volcanism N80-24234
LUNAR SEISMOGRAPHS
Analysis of lunar seismic signals: Determination of instrumental parameters and seismic velocity distribution N80-24232
LYMAN ALPHA RADIATION
Absorption of H and D Lyman-alpha radiation by O2 molecules at high temperatures
[COO-2944-T2] N80-24143

M

MAGNESIUM ALLOYS
Stress corrosion characteristics of Al-Zn-Mg alloys with copper additions N80-23421
MAGNETIC FIELD CONFIGURATIONS
Intense ion beam applications to magnetic confinement fusion
[COO-4460-2] N80-24176
MAGNETIC FIELDS
Emission of particles from a charged sphere into a magnetic field
[AD-A081781] N80-24123
Transient field reversal with a proton layer --- for plasma confinement
[AD-A081724] N80-24169
Experimental observation of plasma paramagnetism in a Tokamak
[COO-2387-115] N80-24174
MAGNETIC FLUX
Vortices in superconducting films
[ISM-258] N80-24195
MAGNETIC MATERIALS
Development of permanent magnet alloys
[BMFT-FB-T-79-23] N80-23443
MAGNETIC MIRRORS
Structural analysis of the magnet system for Mirror Fusion Test Facility (MFTF), addendum 1 --- using NASTRAN
[UCRL-15112] N80-24179
MAGNETIC RECORDING
Video tape recording techniques for Seasat radar data
[AD-A081152] N80-23622
Optimum digital data storage on magnetic tape
[AD-A081049] N80-23996
MAGNETIC SHIELDING
The effect of a saturated shield design on the design, weight, and performance of superconductive acyclic machinery
[AD-A080919] N80-23573
MAGNETIC SUSPENSION
Magnetic bearing support study for a 10 kW-hr energy storage flywheel
[SAND-79-7025] N80-23661
Application of magnetic suspensions and fluid film bearings to energy storage flywheels
[SAND-79-7007] N80-23824
MAGNETIC TAPES
Optimum digital data storage on magnetic tape
[AD-A081049] N80-23996
MAGNETOHYDRODYNAMIC GENERATORS
The optimization air separation plants for combined cycle MHD-power plant applications
[NASA-TM-81510] N80-23778
Summary and evaluation of the parametric study of potential early commercial MHD power plants (PSPEC)
[NASA-TM-81497] N80-23780
Open-cycle coal-fired liquid-metal MHD
[CONF-790640-7] N80-23844

MAGNETOHYDRODYNAMIC STABILITY
Effects of impurity radiation on reversed-field pinch evolution N80-24164
Axisymmetric instability in a noncircular Tokamak: Experiment and theory
[COO-2387-116] N80-24175
MAGNETOHYDRODYNAMICS
MHD air heater development technology
[CONS-3005-T2] N80-23835
Magnetic fusion energy and computers: The role of computing in magnetic fusion energy research and development
[DOE/ER-0033] N80-23838
Open-cycle coal-fired liquid-metal MHD
[CONF-790640-7] N80-23844
Application of advanced computational procedures for modeling solar-wind interactions with Venus: Theory and computer code
[NASA-CR-3267] N80-24240
MAGNETOMETERS
The Magsat magnetometer boom N80-23517
Thermal and cryotechnical definition study on miniaturogenerator system for space application (SQUID magnetometer) — Spacelab payload
[BMFT-FB-W-79-01] N80-23586
MAGSAT A SATELLITE
The Magsat magnetometer boom N80-23517
MAN MACHINE SYSTEMS
Manned maneuvering unit latching mechanism N80-23497
The ZOG approach to man-machine communication
[AD-A081086] N80-23535
Preparation cost and dual-task performance: Further evidence against a general time-sharing factor
[AD-A080857] N80-23996
EVA manipulation and assembly of space structure columns
[NASA-CR-3285] N80-23999
MANAGEMENT INFORMATION SYSTEMS
Space transportation system western launch site construction management information system: A case study
[AD-A077875] N80-23358
Computer science and technology: Selection of data entry equipment
[PB80-144322] N80-23998
A management perspective on the role of information production in the organization
[AD-A081058] N80-24201
Initial conceptualization and characterization of a Navy automated publishing, volume 2
[AD-A080479] N80-24203
MANAGEMENT METHODS
Complexity as a factor of quality and cost in large scale software development
[AD-A081604] N80-24010
Matrix management for aerospace 2000
[NASA-TM-81509] N80-24200
A management perspective on the role of information production in the organization
[AD-A081058] N80-24201
A computer simulation of organizational decision-making
[AD-A081600] N80-24202
The management of information flow in a high technology development environment
[PNR-90002] N80-24206
MANAGEMENT PLANNING
Decision path approach to guidance for climatic environmental test planning (MIL-STD-810C)
[AD-A080909] N80-23866
Environmental development plan for biomass energy systems
[DOE/EDP-0032] N80-23878
Environmental development plan: Geothermal energy systems
[DOE/EDP-0036] N80-23877
Complexity as a factor of quality and cost in large scale software development
[AD-A081604] N80-24010
MANAGEMENT SYSTEMS
The management of information flow in a high technology development environment
[PNR-90002] N80-24206
MANEUVERABILITY
Precision controllability of the YF-17 airplane
[NASA-TP-1677] N80-23327
Manned maneuvering unit latching mechanism N80-23497
MANGANESE ALLOYS
Directional solidification of manganese-bismuth/bismuth alloys N80-23422
The effect of microstructure on the fatigue behavior of an aluminum-lithium alloy — aluminum lithium manganese alloys N80-23424
MANIFOLDS
Spacecraft radiators for advanced mission requirements
[NASA-CR-160580] N80-23362
MANIPULATORS
Triple-axis common-pivot arm wrist device for manipulative applications N80-23506
MANUFACTURING
Preliminary definition and characterizations of solar industrial process heat technology and manufacturing plant for the year 2000
[LA-UR-79-2812] N80-23820
MAPS
Digital screening and halftone techniques for raster processing
[AD-A081090] N80-23753
MARINE BIOLOGY
Remote sensing of aquatic plants — Lake Marion, South Carolina, Lake Seminole, Florida, Ross Barnett Reservoir, Mississippi, and Lake Boeuf and Lake Theriot, Louisiana
[AD-A081737] N80-23754
Mechanism of energy conversion and transfer in bioluminescence
[SRO-635-7] N80-23787
Bioprocesses — in the marine environment N80-23857
MARINE METEOROLOGY
Atlantis 2 cruise 102 moored and shipboard surface meteorological measurements during JASIN 1978
[AD-A080732] N80-23838
Deformation of the marine inversion and the development of marine fog and stratus resulting from warm water patches, numerical modeling and verification with satellite imagery
[AD-A081089] N80-23940
MARKET RESEARCH
Summary and evaluation of the parametric study of potential early commercial MHD power plants (PSPEC)
[NASA-TM-81497] N80-23790
Environmental assessment methodology: Solar power plant applications. Volume 2: Industrial implications and secondary-impact methodology
[EPRI-ER-1070-VOL-2] N80-23796
Electric and hybrid vehicles in the urban future — market research
[CONF-791009-23] N80-24217
MARKOV CHAINS
An algorithm for average costs denumerable state semi-Markov decision problems with applications to controlled production and queueing systems
[MC-BW-94/78] N80-24039
Non-stationary Markov decision problems with converging parameters
[MC-BW-90/78] N80-24070
MARKOV PROCESSES
Control of entry to a queueing system N80-24033
Denumerables state semi-Markov decision processes with unbounded costs, average cost criterion
[MC-BW-92/78] N80-24071
Nonparametric estimation based on censored observations of a Markov renewal process
[MC-SW-64/78] N80-24113
MARS (PLANET)
Mars
[TUM-LRT-KB-13/77] N80-24237
MARS PROBES
Mars
[TUM-LRT-KB-13/77] N80-24237
MARS SURFACE
Volcanic features of Hawaii. A basis for comparison with Mars
[NASA-SP-403] N80-23912
Improved coordinates of features in the vicinity of the Viking lander site on Mars
[NASA-CR-153193] N80-24236
MARSHLANDS
The application of remote sensing technology to the solution of problems in the management of resources in Indiana — pheasant habitats in Benton County, soil mapping in Jasper County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23738
MARTENSITIC TRANSFORMATION
Diffusionless transformations in titanium-nickel N80-23427
MASS FLOW
Numerical studies of physical vapor transport N80-23398
MASS SPECTRA
Computer programs for reducing mass spectra data from GC/MS systems
[PB80-133119] N80-23417
MASS SPECTROSCOPY
Computer programs for reducing mass spectra data from GC/MS systems
[PB80-133119] N80-23417
MASS TRANSFER
Determination of the effect of composition, structure and electrochemical mass transport properties on adhesion and corrosion inhibition of paint films
[AD-A080980] N80-23579
A calculation method for convective heat and mass transfer in multiply-slotted film-cooling applications
[AD-A081641] N80-23809
MATERIALS RECOVERY
Process for the leaching of AP from propellant
[NASA-CASE-NPO-14109-1] N80-23471
MATERIALS SCIENCE
Retrospective study of selected DOD materials and structures research and development programs. Phase 1: Case history data collection
[AD-A080547] N80-24258
MATHEMATICAL LOGIC
Logical investigations on PTQ arising from programming requirements
[MC-ZW-117/78] N80-24025
Interpolation for fragments of the propositional calculus
[MC-ZW-116/78] N80-24096
MATHEMATICAL MODELS
Axial flow rotor unsteady performance
[AD-A081107] N80-23318
Definition of a two-level control system for nonlinear motion of an aircraft
[ESA-TT-614] N80-23330
Numerical studies of physical vapor transport N80-23398
Mechanical modelization of microstructural instabilities in cyclic viscoplasticity at variable temperature
[ONERA-NT-1979-6] N80-23445
Aegis spy-1 radar S-x/80-a switching-mode power supply stability analysis: A stability analysis employing state-space averaging techniques for converter modeling
[AD-A080449] N80-23532
Laser communication climatology study
[AD-A081606] N80-23546
Mathematical model for the separation of gust and maneuvre loads of civil aircraft
[FB-141(1979)] N80-23674
User's manual to the ACTION computer code
[NASA-CR-144873] N80-23860
Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance
[NASA-TM-81818] N80-23863
Applications of generalized derivatives to viscoelasticity
[AD-A081131] N80-23896
Some comments on the endochronic theory of plasticity
[AD-A081825] N80-23899
Modeling the circulation of carbon in the world's terrestrial ecosystems
[DOE/TIC-10260] N80-23710
Development of a winter wheat adjustable crop calendar model — Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
Proposition on energy analysis and economic efficiency
[SERI/RR-51-332] N80-23905
Direct Regional Energy/Economic Modeling (DREEM) design
[DOE/EIA/8345-1] N80-23947

Developing and upgrading of solar system thermal energy storage simulation models
[BCS-40252] N80-23958
Probability modeling and estimation for hourly variation of air pollution concentrations N80-23670
Mathematical models for atmospheric pollutants. Appendix C: Governing equations for atmospheric trace constituents and solution techniques
[EPRI-EA-1131-APP-C] N80-23980
Mathematical models for atmospheric pollutants. Appendix D: Available air quality models
[EPRI-EA-1131-APP-D] N80-23984
Deformation of the marine inversion and the development of marine fog and stratus resulting from warm water patches, numerical modeling and verification with satellite imagery
[AD-A081389] N80-23940
Whole basin model of the Gulf of Mexico
[CONF-790601-12] N80-23962
A framework for the integration of graphics and pattern recognition
[MC-SW-66/78] N80-24021
Control of entry to a queueing system N80-24033
Time series analysis methods and applications increased interdisciplinary interaction could stimulate research breakthroughs
[AD-A081174] N80-24060
Regression analysis for mixed cross-section and time-series data with references to some incomplete observations techniques
[MC-SW-61/78] N80-24083
Stochastic filtering theory: A discussion of concepts, methods, and results
[MC-SW-96/78] N80-24109
Run for your life. A note on the asymptotic speed of propagation of an epidemic
[MC-TW-175/78] N80-24117
Numerical treatment of linearized equations describing inhomogeneous collisionless plasmas
[LA-UR-79-2755] N80-24172
A computer simulation of organizational decision-making
[AD-A081600] N80-24202

MATHEMATICAL PROGRAMMING
Automatic factorization of generalized upper bounds in large scale optimization problems
[AD-A081791] N80-24088

MATRICES (CIRCUITS)
Measured performance characteristics of reflective Butler matrices
[AD-A081002] N80-23541

MATRICES (MATHEMATICS)
The split coefficient matrix method for hyperbolic systems of gasdynamic equations N80-23586
A globally convergent condensation method for geometric programming
[AD-A081067] N80-24019
Finite criteria for conditional definiteness of quadratic forms
[CSIR-TWISK-115] N80-24045
Copositive matrices and definiteness of quadratic forms subject to homogeneous linear inequality constraints
[CSIR-TWISK-89] N80-24047
A note on sparse Quasi-Newton methods
[AD-A081088] N80-24062
Linear least-squares analysis and effective interactions — as applied to nuclear data
[UCRL-82567] N80-24084
A lower bound for the length of partial transversals in a Latin square
[MC-ZW-109/78] N80-24090
A lower bound for the permanents of certain (0,1)-matrices
[MC-ZW-111/78] N80-24092
A computer simulation of organizational decision-making
[AD-A081600] N80-24202

MATRIX METHODS
Program to study SiC fiber reinforced glass matrix composites
[AD-A077639] N80-23379

MATRIX THEORY
Finite criteria for conditional definiteness of quadratic forms
[CSIR-TWISK-115] N80-24045
Two papers on graph embedding problems
[AD-A081449] N80-24058
A lower bound for the permanents of certain (0,1)-matrices
[MC-ZW-111/78] N80-24092

MAXIMUM LIKELIHOOD ESTIMATES
Implementation, interpretation and analysis of a suboptimal boundary finding algorithm
[AD-A081484] N80-24053
Maximum likelihood estimation for an autoregressive process with missing observations
[AD-A081251] N80-24107

MEAN
Bounds for the mean and standard deviation of linear combinations of order statistics
[MC-SW-58/78] N80-24111

MEASURE AND INTEGRATION
Computations concerning the conjecture of Mertens
[MC-NW-64/78] N80-24079

MEASURING INSTRUMENTS
A rocket-borne energy spectrometer using multiple solid-state detectors for particle identification
[NASA-CR-153183] N80-23364

MECHANICAL DEVICES
Mechanisms to deploy the two-stage IUS from the shuttle cargo bay N80-23496
Manned maneuvering unit latching mechanism N80-23497
The Eccentuator: A new concept in actuation N80-23501
The actuated latch pin and its development N80-23502
Mechanisms of UK radiometers flown on Nimbus 5 and 6 with particular reference to bearings, pivots and lubrication N80-23505
A mechanical adapter for installing mission equipment on large space structures N80-23515
Automated beam builder N80-23516
Quartz bell value
[NASA-CASE-NPO-14473-1] N80-23654
Method and apparatus for holding two separate metal pieces together for welding
[NASA-CASE-GSC-12318-1] N80-23655

MECHANICAL DRIVES
Drawer drive for space shuttle vacuum canister — long duration exposure facility N80-23518
A polarimeter for the high resolution ultraviolet spectrometer/polarimeter — Solar Maximum Mission N80-23520
The design and application of an antenna positioner mechanism for Intelsat-5 series communication satellite N80-23521
The mechanisms of the SAMS experiment flown on Nimbus 7 with particular reference to the 2 axis scanning mirror — infrared radiometer for stratospheric and mesospheric investigations N80-23522
Economical drive for large tube mills by means of planetary gears
[NASA-TM-75808] N80-23656

MECHANICAL ENGINEERING
Techniques and applications of mechanical signature analysis N80-23491
Proceedings of the 14th Aerospace Mechanisms Symposium
[NASA-CP-2127] N80-23495
The Shock and Vibration Digest, volume 11, no.8
[AD-A073230] N80-24247

MECHANICAL PROPERTIES
High-temperature mechanical properties of sintered alpha silicon carbide (13 October 1978 - 13 October 1979)
[AD-A081824] N80-23375
Mechanical properties of cold-worked 5083 aluminum
[UCID-18179] N80-23437
Hydrogen embrittlement in vanadium single crystals
[GM-249] N80-23441
Toward an understanding of the mechanical mixed alkali effect in glasses
[AD-A080791] N80-23464
Room temperature mechanical properties of shuttle thermal protection system materials
[NASA-TM-81796] N80-23682
Dynamic mechanical properties of fiber-reinforced composite materials N80-24251

MECHANICAL SHOCK
The Shock and Vibration Digest, volume 11, no. 9
[AD-A074320] N80-23490
The Shock and Vibration Digest, volume 11, no. 11
[AD-A078375] N80-23669
Computer programs: Shock and vibration isolation N80-23671
The Shock and Vibration Digest, volume 11, no. 10
[AD-A078374] N80-24250
The Shock and Vibration Digest, volume 11, no. 2
[AD-A079549] N80-24254

MEDIAN (STATISTICS)
A note on the median of the binomial distribution
[MC-SW-59/78] N80-24081

MELTS (CRYSTAL GROWTH)
Preparation of monotectic alloys having a controlled microstructure by directional solidification under dopant-induced interface breakdown
[NASA-CASE-MFS-23816-1] N80-23419
Laser annealing: Surface epitaxial crystallization, spatial variations measurement, dynamics of annealing and other applications N80-24181
Crystal growth of device quality GaAs in space
[NASA-CR-153190] N80-24185

MEMBRANES
Development of dynamic NMR pulse techniques and applications to membrane permeation and peptide bond rotation kinetics N80-23384
Development of low pressure brackish water reverse osmosis membranes
[PB80-126204] N80-23415
Reverse osmosis membrane of high urea rejection properties — water purification
[NASA-CASE-ARC-10980-1] N80-23452

MERCATOR PROJECTION
Universal transverse Mercator grid tables for latitudes 0-80 degrees Clarke 1866 spheroid (meters). Volume 2: Transformation of coordinates from grid to geographic
[PB80-140411] N80-23763

MERCURY COMPOUNDS
HgCdTe avalanche photodiode development
[AD-A081595] N80-24193

MESOSCALE PHENOMENA
Project severe environmental storms and mesoscale experiment
[PB80-119902] N80-23950

MESOSPHERE
Sounding rocket program aeronomy: Neutral composition of the mesosphere and lower thermosphere during winter-anomaly conditions
[BMFT-FB-W-79-02] N80-23922

MESSAGES
Channels that cooperatively service a data stream and voice messages. Part 2: Diffusion approximations
[AD-A081617] N80-23540

METAL BONDING
Method and apparatus for holding two separate metal pieces together for welding
[NASA-CASE-GSC-12318-1] N80-23655

METAL COATINGS
Metal foils for direct application of absorber coatings on solar collectors
[LBL-9324-REV] N80-23810

METAL FATIGUE
The effects of deformation mode on the behavior of Ti-28%V and Ti-32%V alloys N80-23423
The effect of microstructure on the fatigue behavior of an aluminum-lithium alloy — aluminum lithium manganese alloys N80-23424
Shear lips on fatigue fractures in aluminum alloy sheet material
[LR-287] N80-23675
Practical implementation of the double linear damage rule and damage curve approach for treating cumulative fatigue damage
[NASA-TM-81517] N80-23684

METAL FILMS
Low-cost mirror concentrator based on double-walled metallized, turbular films
[ALO-4227-12] N80-23811

METAL FOILS
Metal foils for direct application of absorber coatings on solar collectors
[LBL-9324-REV] N80-23810

METAL IONS
Metal ion reactions with ozone and atomic oxygen
[AD-A081516] N80-23395

METAL MATRIX COMPOSITES
Program to study SiC fiber reinforced glass matrix composites
[AD-A077638] N80-23379
Preparation of monotectic alloys having a controlled microstructure by directional solidification under dopant-induced interface breakdown
[NASA-CASE-MFS-23816-1] N80-23419
METAL OXIDE SEMICONDUCTORS
An insulated-gate thyristor structure: Principles of operation and design N80-23560
METAL SURFACES
Practical applications of surface analytic tools in tribology
[NASA-TM-81484] N80-23430
Chemical decontamination of metals --- treatment with a cerium-nitric acid solution
[HEDL-SA-1880] N80-23442
METALLOGRAPHY
Power metallurgy of titanium and titanium alloys. Citations from the Engineering Index data base
[PB80-805161] N80-23450
METASTABLE STATE
Metastable phenomena in hydrogen degradation of low carbon alloy steels
[EPRI-AF-1176] N80-23436
Solar photo rate coefficients --- monatomic gases and metastable states
[LA-8085-MS] N80-24243
METEORITES
Sm-Nd and Rb-Sr chronology of crustal formation. Part 1: Ba, Nd and Sm isotopic anomalies in the Allende meteorite, part 2 N80-24235
METEOROLOGICAL FLIGHT
Filtering meteorological flight data
[DFVLR-MITT-79-19] N80-23949
METEOROLOGICAL INSTRUMENTS
Design of an atmospheric sounding radiometer for the GOES meteorological satellite system N80-23519
METEOROLOGICAL PARAMETERS
Chabot Observatory Remote Sensing Experiments (CORSE) --- determining the relationship between weather and air pollution
[UCID-18504] N80-23758
Kwajalein reference atmospheres, 1979
[AD-A081780] N80-23915
Atlantis 2 cruise 102 moored and shipboard surface meteorological measurements during JASIN 1978
[AD-A080732] N80-23938
Statistical retrieval of temperatures from SCR-B, at 10 to 0.4 MB
[AD-A077359] N80-23941
Recommended changes in meteorological measurement and prediction methods for coastal sites
[BNL-26840] N80-23946
METEOROLOGICAL SERVICES
Cosmos. Meteosat: Meteorological Data Distribution (MDD) on Meteosat
[REPT-2786/85-TEA] N80-23353
METEOROLOGY
NOAA's role in the solar energy program
[DOE/ET-0110] N80-23792
Analysis of high sulfate concentrations in greater New York City air
[PB80-126515] N80-23906
METEOSAT SATELLITE
Cosmos. Meteosat: Meteorological Data Distribution (MDD) on Meteosat
[REPT-2786/85-TEA] N80-23353
METHANE
Battery-powered, differential infrared absorption sensor for methane, ethane, and other hydrocarbons
[UCRL-83317] N80-23629
METHOD OF CHARACTERISTICS
Three dimensional flow investigation with a method of characteristics in the inlet region and the blade-to-blade channels of supersonic axial compressors
[ONERA-NT-1979-1] N80-23325
METHYL ALCOHOLS
An electron spectroscopic investigation of the interaction of methanol and ammonia with clean and partially oxidized aluminum surfaces N80-23386
Methanol and methyl fuel catalysts --- CuO/ZnO catalysts
[FE-3177-3] N80-23482
Conceptual design of a coal-to-methanol-to-gasoline commercial plant. Volume 3: Environmental
[FE-2416-43-VOL-3] N80-23485
METROLOGY
A new method of roundness measurement by capacitive detectors
[ONERA-NT-1979-9] N80-23523
MICHELSON INTERFEROMETERS
Development of a laser interferometric dilatometer
[SAND-79-1714C] N80-23650
MICHIGAN
A method for classifying multispectral remote sensing data using context --- Williston, North Dakota and Grand Rapids, Michigan
[E80-10089] N80-23716
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
MICROBALANCES
Gravimetric determination of gas sorption by means of an electronic micro-balance
[PNR-90009] N80-23407
MICROCOMPUTERS
ZMOB: A mob of 256 cooperative z80A-based microcomputers
[NASA-CR-163129] N80-23991
Multiple microcomputer control algorithm
[AD-A080735] N80-23992
Planning of automated data acquisition and process control systems (ADACS)
[AD-A081043] N80-23994
Synthesis of optimal filters using microcomputers
[AD-A081045] N80-23995
Simple microcomputer interface to instruments with parallel decimal (BCD) outputs
[GEPP-397] N80-23997
MICROPROCESSORS
Development of a microprocessor-based instrument for static testing small rocket engines
[AD-A081083] N80-23367
MICROSTRUCTURE
Preparation of monotectic alloys having a controlled microstructure by directional solidification under dopant-induced interface breakdown
[NASA-CASE-MFS-23816-1] N80-23419
The effect of microstructure on the fatigue behavior of an aluminum-lithium alloy --- aluminum lithium manganese alloys N80-23424
Mechanical modelization of microstructural instabilities in cyclic viscoplasticity at variable temperature
[ONERA-NT-1979-6] N80-23445
MICROWAVE AMPLIFIERS
AN/TPQ-37 transmitter tube improvements
[AD-A081393] N80-23565
MICROWAVE FREQUENCIES
Solar microwave bursts accompanying proton events
[AD-A081461] N80-24241
MICROWAVE RADIOMETERS
Digital simulation of dynamic processes in radiometer systems --- microwave radiometers
[NASA-CR-159266] N80-23563
MICROWAVE SENSORS
Development and testing of a microwave system to measure coal layer thickness up to 25 cm
[FE-8881-1] N80-23757
MICROWAVE SPECTRA
Microwave investigations of matter --- bibliographies
[AD-A081708] N80-24141
MICROWAVE SPECTROMETERS
Microwave spectrometer for the detection of transient gaseous species
[LBL-7293] N80-23403
MICROWAVE TRANSMISSION
Performance of a very long 8 GHz microwave link
[PB80-129380] N80-23558
MICROWAVES
Signal level distributions and fade event analyses for a 5 GHz microwave link across the English Channel
[PB80-129396] N80-23557
MILITARY SPACECRAFT
Data processing systems for accelerometer experiments on air force satellites
[AD-A080460] N80-23913
MILITARY TECHNOLOGY
Retrospective study of selected DOD materials and structures research and development programs. Phase 1: Case history data collection
[AD-A080547] N80-24258
MILKY WAY GALAXY
Helium abundances in young clusters and associations N80-24227
MILLIMETER WAVES
Atmospheric effects on millimeter radio waves
[AD-A081414] N80-23547
Microwave investigations of matter --- bibliographies
[AD-A081708] N80-24141
MINERALOGY
Occurrence and mineral chemistry of high pressure phases, Portrillo basalt, southcentral New Mexico
[NASA-CR-153192] N80-23909
MINICOMPUTERS
ORNL 10-m small-angle X-ray scattering camera
[ORNL/TM-6342] N80-23630
MINIMAX TECHNIQUE
A projected Lagrangian algorithm for nonlinear minimax optimization
[AD-A081069] N80-24016
MINING
Coal-shale interface detector
[NASA-CASE-MFS-23720-1] N80-23711
Earth resources data project
[E80-10092] N80-23719
Development and testing of a microwave system to measure coal layer thickness up to 25 cm
[FE-8881-1] N80-23757
MINNESOTA
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
Composition and assembly of a spectral data base for transition year spring wheat blind sites --- North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747
MIRRORS
The mechanisms of the SAMS experiment flown on Nimbus 7 with particular reference to the 2 axis scanning mirror --- infrared radiometer for stratospheric and mesospheric investigations N80-23522
Optimum optical structures for active control --- structural analysis of a mirror system using NASTRAN
[AD-A080934] N80-24157
MISSILE BODIES
Lift, drag and pitching moment measurements on a missile body having various boattails at subsonic and transonic velocities --- in a transonic wind tunnel test
[DFVLR-FB-79-15] N80-23265
MISSILE CONFIGURATIONS
Lift, drag and pitching moment measurements on a missile body having various boattails at subsonic and transonic velocities --- in a transonic wind tunnel test
[DFVLR-FB-79-15] N80-23265
MISSILE CONTROL
Theory of disturbance-utilizing control with application to missile intercept problems
[AD-A081110] N80-23329
Determination of boundaries for kinematic intercept regions and evaluation of the miss distance for Line-Of-Sight (LOS)-guided missiles
[DFVLR-FB-79-13] N80-23354
MISSILE DESIGN
Aerodynamic computer code for computing pressure loads on a missile at high supersonic speeds and generalized altitudes
[AD-A081596] N80-23351
MISSILES
A study of panel loads and centers of pressure of three different cruciform aft-tail control surfaces of a wingless missile from Mach 1.60 to 3.70
[NASA-TM-81787] N80-23251
Finite element analysis of subsonic, transonic and supersonic flows around missiles
[AD-A077375] N80-23261

MISSION PLANNING
A study of the potential impacts of space utilization
[NASA-CR-163131] N80-23339
Prelaunch summary: NOAA-B launch
[NASA-TM-81080] N80-23340
Long Duration Exposure Facility (LDEF): A new multipurpose free-flying experiment carrier
[TUM-LRT-KB-77/17] N80-23359

MISSISSIPPI
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744

MISSOURI
Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721

MIXING LENGTH FLOW THEORY
Morphological-phenomenological examination of the interaction of two ring vortices with the same translation axis and direction
[MPIS-20/1978] N80-23262
Jet injections for optimum mixing in pipe flow
[PB80-128960] N80-23619

MODAL RESPONSE
Vehicle-guideway interaction problems
N80-24255

MODELS
Acoustic test and analyses of three advanced turboprop models
[NASA-CR-159667] N80-23311
Modeling of coupled heat transfer by radiation and convection: Application to Spacelab short module
[ESA-STM-214] N80-23361
Investigating the noise pollution problem. A theoretical model
[IG-PUBL-663] N80-23885

MODULATION
A study of spectrum efficient modulation techniques for digital satellite communications
[Y/212/5086] N80-23556
Stability of modulated rotating fluids --- Galerkin method N80-23595

MODULES
On the advanced power system configuration study
[TP-7753] N80-23355

MOIRE EFFECTS
Visualization of impact damage of composite plates by means of the Moire technique
[NASA-CR-159261] N80-23679

MOLECULAR EXCITATION
Raman spectroscopy of solids
[AD-A081517] N80-23396

MOLECULAR RELAXATION
Absorption of H and D Lyman-alpha radiation by O2 molecules at high temperatures
[COO-2944-T2] N80-24143

MOLECULAR SPECTROSCOPY
Atmospheric effects on millimeter radio waves
[AD-A081414] N80-23547

MOLECULAR STRUCTURE
Computerized method for the generation of molecular transmittance functions in the infrared region
[AD-A081789] N80-24139

MOLTEN SALT ELECTROLYTES
Molten carbonate fuel cell program. Composition gradients induced by current flow in Li2CO3-K2CO3 mixtures
[ORNL/TM-7061] N80-23839

MOLTEN SALTS
Mass transport in molten-salt electrochemical systems
[ORNL/MIT-290] N80-23400

MOLYBDENUM OXIDES
A study of the hydrogen associated with supported and unsupported molybdenum oxide. 1: Molybdena-alumina catalysts. 2: Hydrogen molybdenum bronzes --- gas-metal interactions
N80-23385

MOMENTUM TRANSFER
The turbulent fluxes of momentum and sensible heat over the open sea during moderate to strong winds
[AD-A081392] N80-23943

MONATOMIC GASES
Solar photo rate coefficients --- monatomic gases and metastable states
[LA-8085-MS] N80-24243

MONOCHROMATIZATION
ORNL 10-m small-angle X-ray scattering camera
[ORNL/TM-6342] N80-23630

MONTANA
Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
Processing techniques development, volume 2. Part 1: Crop inventory techniques --- Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741
Composition and assembly of a spectral data base for transition year spring wheat blind sites --- North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747

MOROCCO
Application explorer mission A: Heat capacity mapping mission
[E80-10107] N80-23734

MOTION
Platform motion contributions to simulator training effectiveness. Study 3: Interaction of motion with field-on-view
[AD-A078426] N80-23334

MOTION SIMULATORS
Operations manual: Vertical Motion Simulator (VMS) 5.08
[NASA-TM-81180] N80-23295
NAVAIRDEVCEN dynamic flight simulator design and multipurpose crew station concept design and development plan
[AD-A081982] N80-23335

MOTOR VEHICLES
Environmental assessment of the utilization of alcohol fuels in highway vehicle applications
[CONF-791009-19] N80-23477

MOUNTAINS
Aerosol, trace elements and visibility measurements in mountainous terrain
[PNL-SA-7576] N80-23882

MULTIMODE RESONATORS
Multioscillator laser gyro study
[AD-A081421] N80-23626

MULTIPATH TRANSMISSION
Probe signaling on fading multipath communication channels N80-23528

MULTIPLE ACCESS
The performance of a sampled data delay lock loop implemented with a Kalman loop filter
[AD-A081822] N80-23569

MULTIPROCESSING (COMPUTERS)
A method for classifying multispectral remote sensing data using context --- Williston, North Dakota and Grand Rapids, Michigan
[E80-10089] N80-23716
Concurrent manipulation of binary trees, revision
[AD-A081443] N80-24012
On optimistic methods for concurrency control
[AD-A081452] N80-24037

MULTISPECTRAL PHOTOGRAPHY
Classification of multispectral remote sensing data
[ESA-TT-571] N80-23762

MULTIVARIATE STATISTICAL ANALYSIS
Prediction, estimation and model selection for multivariate normal populations
[TR-44] N80-24043
Efficient estimation of multivariate moving average autocovariances
[AD-A081173] N80-24059
Large deviations of multivariate-L-estimators with monotone weight functions
[MC-SW-63/78] N80-24112

N

N-TYPE SEMICONDUCTORS
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells
[LBL-9916] N80-23785

NASA PROGRAMS
Redox storage systems for solar applications
[NASA-TM-81464] N80-23777
National Aeronautics and Space Administration Authorization Act, 1981
[S-96-719] N80-24210
NASA authorization, 1981
[GPO-59-528] N80-24211

NASTRAN
Aerodynamic computer code for computing pressure loads on a missile at high supersonic speeds and generalized altitudes
[AD-A081596] N80-23351
Optimum optical structures for active control --- structural analysis of a mirror system using NASTRAN
[AD-A080934] N80-24157
Structural analysis of the magnet system for Mirror Fusion Test Facility (MFTF), addendum 1 --- using NASTRAN
[UCRL-15112] N80-24179

NATIONS
World Energy Data System (WENDS). Volume 6: International agreement profiles
[ANL-PHS-79-2-VOL-6] N80-23790

NATURAL LANGUAGE (COMPUTERS)
The ZOG approach to man-machine communication
[AD-A081088] N80-23535

NAVIER-STOKES EQUATION
A class of compressible partial differential equations related to the incompressible Navier-Stokes equation
N80-23597

NAVIGATION AIDS
Study of high-altitude radar altimeter model accuracy and SITAN performance using HAAFT data
[SAND-79-1380] N80-23307
Navigation, guidance, and control for helicopter automatic landings
[NASA-TP-1649] N80-23326
Tactical miniature crystal oscillator
[AD-A080769] N80-23572

NAVIGATION TECHNOLOGY SATELLITES
A comparison of intercontinental clock synchronization by VLBI and the NTS satellite
[NASA-TM-81063] N80-24124

NAVSTAR SATELLITES
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2D: Specific study no. 4, gyro accuracy requirements in a strap down inertial navigation system with GPS aiding for RPV missions
[AGARD-AR-147-VOL-2D] N80-23294
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2A: Specific application study no. 1, close air support
[AGARD-AR-147-VOL-2A] N80-23303

NAVY
Oceanographic remote sensing: A position paper --- Navy
[AD-A081494] N80-23752

NEBRASKA
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726

NEGATIVE IONS
Negative-hydrogen-ion production by backscattering from alkali-metal targets
[LBL-9992] N80-24144

NEODYMIUM LASERS
Induced evaporation of metal from an aluminum surface by a normal pulse neodymium laser
[AD-A081601] N80-23638
Mechanical design for a large fusion laser system
[UCRL-82928] N80-23648

NERVES
Coronary plexus in man and monkey N80-23971

NETHERLANDS
Pointbars: A comparative examination along the large Dutch rivers --- Netherlands
[REPT-2] N80-23760
Voorne-Putten: A landscape-ecological survey --- Rhine delta, Netherlands
[REPT-4] N80-23761
NOx and O3, flushing: Air pollution in 1976 --- Netherlands
[IG-TNO-G-675] N80-23889

NOx and O3, Vlaardingen: Air pollution in 1976 — Netherlands
[IG-TNO-G-678] N80-23890
Air pollution at Schouwen-Duiveland, 1976 — the Netherlands
[IG-TNO-G-679] N80-23891
Air pollution in Delft, 1977
[IG-TNO-G-764] N80-23892
NOx and O3. Flushing: Air pollution in 1977 — in the Netherlands
[IG-TNO-G-765] N80-23893
NOx and O3, Vlaardingen: Air pollution in 1977 — Netherlands
[IG-TNO-G-766] N80-23894
Air pollution in Delft. Measurements of smoke during 1977 in Delft and Naaldwijk
[IG-TNO-G-768] N80-23895
Fluoride measurements in southern Netherlands. Measurements at Delft, Naaldwijk and Maasland during 1977
[IG-TNO-G-769] N80-23896
Air pollution studies in the Nieuwe-Waterweg region using deposit gages, 1977 data — Netherlands
[IG-TNO-G-771] N80-23897
SO2 measurements in Rotterdam: Volumetric SO2 determinations, April 1977 to March 1978
[IG-TNO-G-794] N80-23898
PAN: Measurements at Delft in 1974
[IG-TNO-G-966] N80-23900
NOx and O3. Air pollution in 1973 — in the Netherlands
[IG-TNO-G-967] N80-23901

NETWORK ANALYSIS
The M/G/1 queue with instantaneous Bernoulli feedback
[AD-A081256] N80-24038

NETWORK SYNTHESIS
Synthesis of optimal filters using microcomputers
[AD-A081045] N80-23896

NETWORKS
Queuing networks
[AD-A081257] N80-24035
Some results on acyclic times in acyclic Jackson networks, revision
[AD-A080737] N80-24036

NEUROPHYSIOLOGY
Coronary plexus in man and monkey N80-23871

NEUTRAL ATOMS
ANTIC: A code for calculation of neutral transport in cylindrical plasmas
[SAI-79-1056-LJ] N80-24160

NEUTRAL GASES
Sounding rocket program aeronomy: Neutral composition of the mesosphere and lower thermosphere during winter-anomaly conditions
[BMFT-FB-W-79-02] N80-23922

NEUTRON COUNTERS
Neutron-meter calibration for the 1978 Colby soil moisture experiment — Thomas County, Kansas
[E80-10120] N80-23746

NEUTRON SCATTERING
Non-destructive evaluation of defects in structural materials using long-wavelength neutrons
[AD-A081097] N80-23665
Neutron-meter calibration for the 1978 Colby soil moisture experiment — Thomas County, Kansas
[E80-10120] N80-23746

NEUTRON STARS
Studies on gravitational waves and stars with neutron cores N80-24229

NEW JERSEY
LANDSAT's role in state coastal management programs — New Jersey and Texas
[E80-10101] N80-23728
LANDSAT'S role in HUD 701 programs — New Jersey and South Dakota
[E80-10102] N80-23729

NEW MEXICO
Occurrence and mineral chemistry of high pressure phases, Portrillo basalt, southeastern New Mexico
[NASA-CR-153192] N80-23909
Gravity study of the Los Alamos area, New Mexico
[LA-8154-MS] N80-23929

NEW YORK
Analysis of high sulfate concentrations in greater New York City air
[PB80-128515] N80-23906

NEWTON-RAPHSON METHOD
Maximum likelihood estimation for an autoregressive process with missing observations
[AD-A081251] N80-24107

NEWTONIAN FLUIDS
Applications of generalized derivatives to viscoelasticity
[AD-A081131] N80-23886

NICKEL
A surface analysis study of carbon monoxide and hydrogen absorption and desorption of Ni(3) crystals — catalytic reactivity N80-23425
Diffusionless transformations in titanium-nickel N80-23427

NICKEL ALLOYS
Fatigue at high temperatures: Examination of the behavior of gasturbine casting materials also in simultaneous temperature and strain cycles
[BMFT-FB-T-79-28] N80-23444

NICKEL ZINC BATTERIES
Research, development and demonstration of nickel-zinc batteries for electric vehicle propulsion
[ANL/OEPM-78-12] N80-23861
Research, development, and demonstration of nickel-zinc batteries for electric vehicle propulsion — electrode development program
[ANL/OEPM-79-10] N80-24215

NIMBUS SATELLITES
The mechanisms of the SAMS experiment flown on Nimbus 7 with particular reference to the 2 axis scanning mirror — infrared radiometer for stratospheric and mesospheric investigations N80-23522

NIMBUS 5 SATELLITE
Mechanisms of UK radiometers flown on Nimbus 5 and 6 with particular reference to bearings, pivots and lubrication N80-23505

NIMBUS 6 SATELLITE
Mechanisms of UK radiometers flown on Nimbus 5 and 6 with particular reference to bearings, pivots and lubrication N80-23505

NITRIC ACID
Chemical decontamination of metals — treatment with a cerium-nitric acid solution
[HEDL-SA-1880] N80-23442

NITRILES
Piezoelectricity in polyacrylonitrile — as a function of temperature
[AD-A081250] N80-24190

NITROGEN
Gas and aerosol fluxes — emphasizing sulfur, nitrogen, and carbon N80-23959

NITROGEN DIOXIDE
Measuring techniques for NO2
[IG-TNO-G-852] N80-23899

NITROGEN IONS
Examination of the reactions of O+ with CH4, C2H4, C2H6, C3H8 and N+ with CO by measurement of the luminescence and the translational energy of the product ions
[MPIS-9/1979] N80-23405

NITROGEN OXIDES
Application of laser-induced fluorescence for measuring reaction rate constants in H-N-C-O systems
[MPIS-13/1979] N80-23406
Formation of prompt nitrogen oxides during combustion of hydrocarbons
[ESA-TT-579] N80-23411
NOx and O3, flushing: Air pollution in 1976 — Netherlands
[IG-TNO-G-675] N80-23889
NOx and O3, Vlaardingen: Air pollution in 1976 — Netherlands
[IG-TNO-G-678] N80-23890
NOx and O3, Vlaardingen: Air pollution in 1977 — Netherlands
[IG-TNO-G-766] N80-23894
NOx and O3. Air pollution in 1973 — in the Netherlands
[IG-TNO-G-967] N80-23901

NOAA SATELLITES
Prelaunch summary: NOAA-6 launch
[NASA-TM-81080] N80-23340

NOISE MEASUREMENT
Acoustic test and analyses of three advanced turboprop models
[NASA-CR-159667] N80-23311
Gyro noise measurement and analysis
[NLR-TR-79077-U] N80-23635
Spectral analysis of non-stationary random processes. Application to noise of flyover type
[ONERA-NT-1979-4] N80-24134

NOISE POLLUTION
Evaluating and minimizing noise impact due to aircraft flyover
[NASA-CR-153187] N80-23874
Investigating the noise pollution problem. A theoretical model
[IG-PUBL-663] N80-23885

NOISE PROPAGATION
Far-field radiation of aft turbofan noise
[NASA-TM-81506] N80-24129

NOISE REDUCTION
OSCEE fan exhaust bulk absorber treatment evaluation
[NASA-TM-81488] N80-23314
Evaluating and minimizing noise impact due to aircraft flyover
[NASA-CR-153187] N80-23874

NOISE SPECTRA
Spectral analysis of non-stationary random processes. Application to noise of flyover type
[ONERA-NT-1979-4] N80-24134

NOMENCLATURES
Identification system for apparatus and plant used in thermal power stations
[PNR-90006] N80-23863
System requirements analysis for the Chemical Structure and Nomenclature System (CSNS)
[PB80-105216] N80-24207

NONDESTRUCTIVE TESTS
Improving a real time acoustical holographic system for flaw detection
[AD-A080918] N80-23625
Noncontact, laser interferometer sweep gage
[Y-2190] N80-23631
Non-destructive evaluation of defects in structural materials using long-wavelength neutrons
[AD-A081097] N80-23665
Ultrasonic nondestructive testing of materials — graphite-epoxy and boron-epoxy composite materials
[AD-A078370] N80-23667
The LASL nondestructive testing group
[LA-UR-79-3071] N80-23668
The behavior of optical glass fibers at extreme temperatures
[PHL-1979-37] N80-24162

NONLINEAR EQUATIONS
The strength of nonstationary iteration
[AD-A081450] N80-24120

NONLINEAR FILTERS
New results on the innovations problem for non-linear filtering
[AD-A091574] N80-23566

NONLINEAR PROGRAMMING
Finding the global minimum of a function of one variable using the method of constant signed higher order derivatives
[AD-A081401] N80-24005
A projected Lagrangian algorithm for nonlinear minimax optimization
[AD-A081069] N80-24018
A globally convergent condensation method for geometric programming
[AD-A081067] N80-24019
Determining feasibility of a set of nonlinear inequality constraints
[AD-A081602] N80-24054
Locating an isolated global minimizer of a constrained nonconvex program
[AD-A080180] N80-24119

NONLINEAR SYSTEMS
State-of-the-art report on numerical integration methods for analysis of stiff structural analysis systems N80-23681
Chances and handicaps of rod-beam theories
[ESA-TT-598] N80-23705
Nonlinear system identification study. Part 1: Implementation feasibility study
[AD-A081464] N80-23990
A nonlinear vector finite difference scheme
[NC-BW-80/78] N80-24069
Recent development for the nonlinear distortion of non-dispersive acoustic waves. Part 2: Multidimensional systems N80-24248

NONLINEARITY
Computer programs for calculating partially cavitating blunt trailing edged cascade flows in nonlinear theory
[AD-A081832] N80-23610
Optimization techniques for shock and vibration isolator development N80-24253
NONPARAMETRIC STATISTICS
Nonparametric estimation based on censored observations of a Markov renewal process
[MC-SW-64/78] N80-24113
NONUNIFORM FLOW
Hydroelastic oscillations of smooth and rough cylinders in harmonic flow
[AD-A081760] N80-23606
NONUNIFORM PLASMAS
Numerical treatment of linearized equations describing inhomogeneous collisionless plasmas
[LA-UR-79-2755] N80-24172
NONUNIFORMITY
Nonuniformity of the convergence of location estimators
[MC-SW-60/78] N80-24082
NORMAL DENSITY FUNCTIONS
The large sample behavior of transformations to normality
[AD-A080885] N80-24106
NORMALITY
The large sample behavior of transformations to normality
[AD-A080885] N80-24106
NORTH DAKOTA
A method for classifying multispectral remote sensing data using context --- Williston, North Dakota and Grand Rapids, Michigan
[E80-10089] N80-23716
Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
Integrated use of LANDSAT data for state resource management --- Arizona, Georgia, North Dakota, and Texas
[E80-10095] N80-23722
Evaluation of several schemes for classification of remotely sensed data: Their parameters and performance --- Foster County, North Dakota; Grant County, Kansas; Iroquois County, Illinois, Tippecanoe County, Indiana; and Pottawattamie and Shelby Counties, Iowa
[E80-10105] N80-23732
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
Composition and assembly of a spectral data base for transition year spring wheat blind sites --- North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747
NOSE CONES
Measured and predicted shock shapes and aerodynamic coefficients for blunted cones at incidence in air at Mach 5.9
[NASA-TP-1652] N80-23600
NOSE TIPS
Active control of asymmetric vortex effects
[AD-A081648] N80-23254
NOZZLE DESIGN
Static calibration of a two-dimensional wedge nozzle with thrust vectoring and spanwise blowing
[NASA-TM-81161] N80-23317
Electric fuel nozzles for combustors
[SAN/1442-79/T1] N80-23660
NUCLEAR EXPLOSIONS
The VIBRA-6 subsonic aerodynamic nuclear gust vulnerability code
[AD-A081722] N80-23256
NUCLEAR FUSION
Magnetic fusion energy and computers: The role of computing in magnetic fusion energy research and development
[DOE/ER-0033] N80-23838
Intense ion beam applications to magnetic confinement fusion
[COO-4460-2] N80-24176
NUCLEAR MAGNETIC RESONANCE
Development of dynamic NMR pulse techniques and applications to membrane permeation and peptide bond rotation kinetics N80-23384
NUCLEAR POWER PLANTS
Recommended changes in meteorological measurement and prediction methods for coastal sites
[BNL-26840] N80-23946
NUCLEATION
Ice crystal growth in a dynamic thermal diffusion chamber
[NASA-TP-1651] N80-23934
NULL HYPOTHESIS
The method of n rankings when the underlying distributions are discrete
[CSIR-TWISK-108] N80-24100
NUMERICAL ANALYSIS
Measured and predicted shock shapes and aerodynamic coefficients for blunted cones at incidence in air at Mach 5.9
[NASA-TP-1652] N80-23600
Analysis of some laser light show effects for classification purposes
[PB80-131576] N80-23652
Computer analysis of shells and composites
[AD-A081469] N80-23690
Interaction of large amplitude stress waves in layered elastic-plastic materials
[AD-A081429] N80-23691
Numerical analysis of temperature and flow effects in a dry, two-dimensional, porous-media reservoir used for compressed air energy storage
[PNL-3047] N80-23823
Mathematical models for atmospheric pollutants. Appendix C: Governing equations for atmospheric trace constituents and solution techniques
[EPRI-EA-1131-APP-C] N80-23880
Boundary conditions for the numerical solution of elliptic equations in exterior regions
[NASA-CR-153185] N80-24044
Global error estimation for stiff ODEs.
[SAND-79-1587] N80-24065
The application of iterated defect correction to the LOD method for parabolic equations
[MC-NW-58/78] N80-24075
Error bounds for exponentially fitted Galerkin methods applied to stiff two-point boundary value problems
[MC-NW-62/78] N80-24077
The Shock and Vibration Digest, volume 11, no.8
[AD-A073239] N80-24247
NUMERICAL CONTROL
Multiple microcomputer control algorithm
[AD-A080735] N80-23992
NUMERICAL FLOW VISUALIZATION
Numerical flow field program for aerodynamic heating analysis. Volume 1: Equations and results
[AD-A081471] N80-23255
Numerical flow field program for aerodynamic heating analysis. Volume 2: User's manual
[AD-A081472] N80-23260
NUMERICAL INTEGRATION
Applications of random-choice method to problems in shock and detonation-wave dynamics
[AD-A081304] N80-23603
State-of-the-art report on numerical integration methods for analysis of stiff structural analysis systems N80-23681
A nested partioning procedure for numerical multiple integration
[AD-A081070] N80-24061
A numerical method to integrate Stiff systems of ordinary differential equations
[AD-A080998] N80-24063
NUMERICAL WEATHER FORECASTING
Numerical methods for solution of the shallow-water equations in meteorology
[CSIR-SR-WISK-10] N80-23936
NUTS (FASTENERS)
Floating nut retention system
[NASA-CASE-MSC-16938-1] N80-23653

O

OATS
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
OCEAN CURRENTS
Applications of a dedicated gravitational satellite mission --- to study of oceanic circulation and earth structure
[AD-A076438] N80-23917
Validation of ocean tide models from satellite altimetry
[AD-A078294] N80-23961
OCEAN DATA ACQUISITIONS SYSTEMS
Atlantis 2 cruise 102 moored and shipboard surface meteorological measurements during JASIN 1978
[AD-A080732] N80-23938
OCEAN MODELS
Validation of ocean tide models from satellite altimetry
[AD-A078294] N80-23961
Whole basin model of the Gulf of Mexico
[CONF-790631-12] N80-23962
OCEAN SURFACE
Global geochemical problems N80-23958
OCEANOGRAPHIC PARAMETERS
Bioprocesses --- in the marine environment N80-23957
OCEANOGRAPHY
Oceanographic remote sensing: A position paper --- Navy
[AD-A081494] N80-23752
California Sea Grant College Program: An overview 1977 - 1978
[PB80-127988] N80-23964
OHIO
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Analysis and design of a 100-kilowatt solar photovoltaic flat-panel power system for a machining and metalworking facility in Columbus, Ohio. Phase 1: Photovoltaic flat panel application experiment
[DOE/ET/23055-1] N80-23860
OIL EXPLORATION
Further development of seismic methods: Three-dimensional velocity determinations
[BMFT-FB-T-79-19] N80-23925
OIL RECOVERY
Geokinetics in situ shale oil recovery project
[LETC-10787-25] N80-23755
OKLAHOMA
Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
OPERATIONS RESEARCH
An adaptive branching rule for the permutation flow-shop problem
[MC-BW-91/78] N80-24115
OPTICAL COMMUNICATION
A 3-5 heterostructure avalanche photodiode modules for fiber optic communication links in the 1.0 to 1.3 micrometer spectral range
[AD-A081185] N80-23539
The 3-V heterostructure avalanche photodiode modules for fiber optic communication links in the 1.0 to 1.3 micrometer spectral range
[AD-A081747] N80-23542
Laser communication climatology study
[AD-A081656] N80-23546
Analysis of multimode fiber couplers, tapers and mode converters
[AD-A081669] N80-24154
OPTICAL DATA PROCESSING
The optical processor as an array antenna controller
[AD-A081790] N80-24153
OPTICAL EQUIPMENT
Mechanical design for a large fusion laser system
[UCRL-82928] N80-23648
Method of forming a sharp edge on an optical device
[NASA-CASE-GSC-12348-1] N80-24149
OPTICAL PROPERTIES
Theoretical and experimental studies on the dielectric and optical properties of fluids under high pressure N80-23389
OPTICAL RADAR
Dual-frequency Doppler-Lidar method of wind measurement
[AD-A080849] N80-23623

OPTICAL RANGE FINDERS
High resolution optical ranging system
N80-24150

OPTICAL SCANNERS
Model of a starfield identifier
[BMFT-FB-W-79-05] N80-24161

OPTICAL SLANT RANGE
IRemote sensing methods for determination of slant range visibility
[DFVLR-FB-79-14] N80-23759

OPTICAL TRACKING
Constant magnification optical tracking system
[NASA-CASE-NPO-14813-1] N80-24152

OPTIMAL CONTROL
Definition of a two-level control system for nonlinear motion of an aircraft
[ESA-TT-614] N80-23330
Use of adaptive optimal control to provide energy conservation in large buildings
[LA-UR-79-3354] N80-23804
System optimization by periodic control
[AD-A080295] N80-24034

OPTIMIZATION
Lighter and stronger
[AD-A081317] N80-23694
Automatic factorization of generalized upper bounds in large scale optimization models
[AD-A081614] N80-24017
Locating an isolated global minimizer of a constrained nonconvex program
[AD-A080180] N80-24119
A survey of structural optimization under dynamic constraints N80-24256

ORBITAL ASSEMBLY
Automated beam builder N80-23516
EVA manipulation and assembly of space structure columns
[NASA-CR-3285] N80-23988

ORGANIC COMPOUNDS
Electro-oxidation of hydrogen and propane in strong organic acid electrolytes N80-23392
Analytical chemical system for the determination of heavy metals and organic compounds
[COO-4320-2] N80-23402
The use of indigodisodiumdisulfonate to combat molds in ozone reagents
[IG-TNO-G-861] N80-23408

ORGANIZATIONS
World Energy Data System (WENDS). Volume 6: International agreement profiles
[ANL-PMS-79-2-VOL-6] N80-23790

ORGANOMETALLIC COMPOUNDS
Preparation of polymers using metal-carbenes
[AD-A080891] N80-23458

ORIFICES
Wind tunnel investigation of an all flush orifice air data system for a large subsonic aircraft — conducted in a Langley 8 foot transonic pressure tunnel
[NASA-TP-1642] N80-23304

OSCILLATING CYLINDERS
The harmonically oscillating body in subsonic flow: Effect of compressibility
[ESA-TT-584] N80-23270

OSCILLATING FLOW
Hydroelastic oscillations of smooth and rough cylinders in harmonic flow
[AD-A081760] N80-23606

OSMOSIS
Development of a composite reverse osmosis membrane for single pass seawater desalination
[PB80-124852] N80-23414
Development of low pressure brackish water reverse osmosis membranes
[PB80-126204] N80-23415

OUTLET FLOW
Far-field radiation of aft turbofan noise
[NASA-TM-81506] N80-24129

OXIDATION
An electron spectroscopic investigation of the interaction of methanol and ammonia with clean and partially oxidized aluminum surfaces N80-23386
The chemical transformation of sulfur dioxide to sulfate in the plume of the coal-burning Keystone power plant N80-23873

OXIDATION-REDUCTION REACTIONS
Chemical decontamination of metals — treatment with a cerium-nitric acid solution
[HEDL-SA-1880] N80-23442
Redox storage systems for solar applications
[NASA-TM-81464] N80-23777

OXYGEN
Oxygen reduction of a graphite paste and a catalyst loaded graphite paste electrode N80-23390
Kinetic and thermodynamic studies of liquid metal-oxygen systems using solid state electrochemical techniques N80-23428
Absorption of H and D Lyman-alpha radiation by O2 molecules at high temperatures
[COO-2944-T2] N80-24143

OXYGEN ATOMS
Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation
[LBL-9811] N80-24142

OXYGEN IONS
Examination of the reactions of O+ with CH4, C2H4, C2H6, C3H8 and N+ with CO by measurement of the luminescence and the translational energy of the product ions
[MPIS-9/1979] N80-23405

OZONE
Metal ion reactions with ozone and atomic oxygen
[AD-A081516] N80-23395
NOx and O3, flushing: Air pollution in 1976 — Netherlands
[IG-TNO-G-675] N80-23889
NOx and O3, Vlaardingen: Air pollution in 1976 — Netherlands
[IG-TNO-G-678] N80-23890
NOx and O3, Vlaardingen: Air pollution in 1977 — Netherlands
[IG-TNO-G-766] N80-23894
NOx and O3. Air pollution in 1973 — in the Netherlands
[IG-TNO-G-867] N80-23901
Spatial variability of ozone and other pollutants at St. Louis, Missouri
[PB80-132830] N80-23930

P

P WAVES
Attenuation of teleseismic P-waves within geothermal systems N80-23529

PACIFIC OCEAN
Comprehensive study of the seismotectonics of the eastern Aleutian arc and associated volcanic systems
[COO-3134-20] N80-23919

PACKAGING
Improved packaging for the LN-31 inertial measurement unit (F-15 aircraft)
[AD-A081745] N80-23293

PAINTS
Determination of the effect of composition, structure and electrochemical mass transport properties on adhesion and corrosion inhibition of paint films
[AD-A080960] N80-23578

PANELS
Peak wind loads on cladding panels and their dependence upon panel size
[OUEL-1286/79] N80-23708

PARABOLIC DIFFERENTIAL EQUATIONS
One-step splitting methods formulated for semi-discrete parabolic equations
[MC-NW-55/78] N80-24073
The application of iterated defect correction to the LOD method for parabolic equations
[MC-NW-58/78] N80-24075

PARABOLOID MIRRORS
Development of new technologies for ultra-precise large-scale astronomical instruments, in particular mirror telescopes
[BMFT-FB-T-79-10] N80-24163

PARACHUTES
An assessment of the stability and opening characteristics of cruciform parachutes
[BU-238] N80-23276
A spin-recovery parachute system for light general-aviation airplanes N80-23512

PARALLEL PLATES
Modification of the aurora electromagnetic environment experiment and interpretation — electromagnetic field produced by a thick target using parallel plate transmission lines
[AD-A080604] N80-23534

PARALLEL PROCESSING (COMPUTERS)
A dynamically reconfigurable distributed computing system — integrating pipelining and parallel processing N80-23969
ZMOB: A mob of 256 cooperative z80A-based microcomputers
[NASA-CR-163129] N80-23991
Interconnection network in multiple-processor systems
[AD-A080959] N80-23993

PARAMAGNETISM
Experimental observation of plasma paramagnetism in a Tokamak
[COO-2387-115] N80-24174

PARAMETERIZATION
State and parameter estimation for reentry vehicle lateral motion N80-23345

PARKS
Integrated surveys of the natural resources in the Amazonia National Park (Topajos) based on LANDSAT images — Brazil
[E80-10109] N80-23736

PARSING ALGORITHMS
A finite state lexical analyzer for the standard hardware representation of ALGOL 68
[MC-IW-98/78] N80-24023

PARTIAL DIFFERENTIAL EQUATIONS
A class of compressible partial differential equations related to the incompressible Navier-Stokes equation N80-23597
Numerical methods for solution of the shallow-water equations in meteorology
[CSIR-SR-WISK-10] N80-23936
Semi-discretization methods for partial differential equations on nonrectangular grids
[MC-NW-56/78] N80-24074
Theory and numerical methods of resolution of partial differential equations
[ESA-TT-606] N80-24098

PARTICLE ACCELERATION
Collective drag experienced by an electron beam in the pure runaway regime
[AD-A081116] N80-24145
The collective acceleration mechanism of solar cosmic rays — nuclei trapped by electron bunching
[IFVE-OTF-78-112] N80-24246

PARTICLE ACCELERATORS
Radiation and shielding around beam absorbers
[INTERIKO-78/7] N80-24148

PARTICLE BEAMS
Velocity distribution in a pinched beam
[UCID-18303] N80-24177

PARTICLE COLLISIONS
Electromagnetic interaction of colliding beams on storage rings
[BNL-27035] N80-23549

PARTICLE SIZE DISTRIBUTION
Summary of the research and development effort on open-cycle coal-fired gas turbines
[ORNL/TM-6253] N80-23821
Conduct of cloud spectra measurements
[AD-A081127] N80-23914

PARTICLE TRAJECTORIES
Emission of particles from a charged sphere into a magnetic field
[AD-A081781] N80-24123
Ergodic orbits in particle simulations of strong ion rings
[AD-A081391] N80-24168

PARTITIONS (MATHEMATICS)
A nested partioning procedure for numerical multiple integration
[AD-A081070] N80-24061

PASCAL (PROGRAMMING LANGUAGE)
A sound and complete Hoare-like system for a fragment of PASCAL
[MC-IW-97/78] N80-24022

PATTERN RECOGNITION
A method for classifying multispectral remote sensing data using context — Williston, North Dakota and Grand Rapids, Michigan
[E80-10089] N80-23716
Sampling for area estimation: A comparison of full-frame sampling with the sample segment approach
[E80-10104] N80-23731

Evaluation of several schemes for classification of remotely sensed data: Their parameters and performance — Foster County, North Dakota; Grant County, Kansas; Iroquois County, Illinois, Tippecanoe County, Indiana; and Pottawattamie and Shelby Counties, Iowa
[E80-10105] N80-23732
Applicability of selected wheat remote sensing technology to corn and soybeans
[E80-10112] N80-23739
Processing techniques development, volume 3. Part 2: Data preprocessing and information extraction techniques
[E80-10115] N80-23742
Corn/soybean decision logic: Improvements and new crops — Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
Research for information extraction from aerial imagery
[AD-A080744] N80-23749
A framework for the integration of graphics and pattern recognition
[MC-IW-96/78] N80-24021

PENNSYLVANIA
Hydrologic evaluation of the stormflow generation process on a forested watershed — Pennsylvania
N80-23713

PEPTIDES
Development of dynamic NMR pulse techniques and applications to membrane permeation and peptide bond rotation kinetics N80-23384

PERFORMANCE PREDICTION
Spacecraft radiators for advanced mission requirements
[NASA-CR-160589] N80-23362
Design, stability and performance of two-dimensional recursive digital filters N80-23562
Measured and predicted shock shapes and aerodynamic coefficients for blunted cones at incidence in air at Mach 5.9
[NASA-TP-1652] N80-23600
A discriminant analysis of pilot performance prediction and selection for air-to-air combat
N80-23984

PERFORMANCE TESTS
CF6 jet engine performance improvement: New fan
[NASA-CR-159699] N80-23309
CF6-6D engine short-term performance deterioration
[NASA-CR-159830] N80-23316
Autoclave testing of plastic encapsulated 4001 CMOS integrated circuits
[AD-A081555] N80-23570
Parametric performance evaluation and technical assessment of adiabatic compressed air energy storage systems
[EPRI-EM-1188] N80-23796

PERIODIC VARIATIONS
History of the Sun's luminosity, 0 to 480,000 BP, based on the geologic record in light of recent climate theory
[UCRL-80972-REV-2] N80-24244

PERMEABILITY
Development of dynamic NMR pulse techniques and applications to membrane permeation and peptide bond rotation kinetics N80-23384

PERMITTIVITY
Measurement of the thickness of liquid film by means of capacitance method
[EPRI-NP-1212] N80-23614

PERTURBATION
Error bounds for exponentially fitted Galerkin methods applied to stiff two-point boundary value problems
[MC-NW-62/78] N80-24077
On a class of elliptic singular perturbations with applications in population genetics
[MC-TW-184/78] N80-24087
Recent development for the nonlinear distortion of non-dispersive acoustic waves. Part 2: Multidimensional systems N80-24248

PERTURBATION THEORY
On disturbance fields of moving singularities in aerodynamics and aeroacoustics
[ESA-TT-570] N80-23269
General perturbations theories derived from the 1965 lane drag theory
[AD-A081264] N80-23347
Development of perturbation procedures for nonlinear inviscid and viscous flows — transonic flow
[AD-A081531] N80-23605

PETROGRAPHY
Occurrence and mineral chemistry of high pressure phases, Portrillo basalt, southcentral New Mexico
[NASA-CR-153192] N80-23909

PHASE CONTROL
A dynamic programming algorithm for phase estimation and data decoding on random phase channels
[AD-A081314] N80-23564
The optical processor as an array antenna controller
[AD-A081790] N80-24153

PHASE LOCKED SYSTEMS
The performance of a sampled data delay lock loop implemented with a Kalman loop filter
[AD-A081822] N80-23569

PHASED ARRAYS
The optical processor as an array antenna controller
[AD-A081790] N80-24153

PHASED LOCKED SYSTEMS
A dynamic programming algorithm for phase estimation and data decoding on random phase channels
[AD-A081314] N80-23564

PHENOLOGY
Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720
Development of a winter wheat adjustable crop calendar model — Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
Variability of crop calendar stage dates — Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Applicability of selected wheat remote sensing technology to corn and soybeans
[E80-10112] N80-23739
Processing techniques development, volume 2. Part 1: Crop inventory techniques — Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741
Interpretation of LANDSAT digital data using a cubic color model based on relative energies
[E80-10119] N80-23745
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

PHONONS
The effects of phonon dynamics on the singular behavior of a one-dimensional Fermi gas
N80-23586

PHOTOCHEMICAL OXIDANTS
Air pollution in Delft, 1977
[IG-TNO-G-764] N80-23892
PAN: Measurements at Delft in 1974
[IG-TNO-G-866] N80-23900
Air quality criteria for ozone and other photochemical oxidants
[PB80-124753] N80-23905

PHOTOCHEMICAL REACTIONS
Solvent effects on photophysical parameters for coumarin laser dyes
[AD-A081749] N80-23641

PHOTOCONDUCTIVITY
Investigation of laser optical biasing on the quantum transport properties of n-InSb
[AD-A081578] N80-23644

PHOTODECOMPOSITION
Photolytic decomposition of water into oxygen and hydrogen as an alternative energy utilization of households and small consumers
[ESA-TT-582] N80-23865

PHOTODIODES
A 3-5 heterostructure avalanche photodiode modules for fiber optic communication links in the 1.0 to 1.3 micrometer spectral range
[AD-A081185] N80-23539
The 3-V heterostructure avalanche photodiode modules for fiber optic communication links in the 1.0 to 1.3 micrometer spectral range
[AD-A081747] N80-23542
Interface properties and surface leakage of HgCdTe photodiodes
[AD-A081530] N80-23568
HgCdTe avalanche photodiode development
[AD-A081595] N80-24193

PHOTOELASTICITY
Lighter and stronger
[AD-A081317] N80-23694

PHOTOELECTRIC EMISSION
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells
[LBL-9916] N80-23785

PHOTOGEOLOGY
LANDSAT'S role in HUD 701 programs — New Jersey and South Dakota
[E80-10102] N80-23729
LANDSAT reconnaissance images of the great soil region in the western part of the Paraiba Basin — Brazil
[E80-10103] N80-23730
Study of geological structure of Sicily and other Italian areas — Gulf of Orosei, East Sardinia
[E80-10108] N80-23735
Integrated surveys of the natural resources in the Amazonia National Park (Topajos) based on LANDSAT images — Brazil
[E80-10109] N80-23736
Volcanic features of Hawaii. A basis for comparison with Mars
[NASA-SP-403] N80-23912

PHOTOGRAMMETRY
Automation in photogrammetry — use of digital image processing technology
[AD-A081582] N80-23750
Improved coordinates of features in the vicinity of the Viking lander site on Mars
[NASA-CR-153193] N80-24236

PHOTOGRAPHY
Digital screening and halftone techniques for raster processing
[AD-A081090] N80-23753

PHOTOINTERPRETATION
LANDSAT reconnaissance images of the great soil region in the western part of the Paraiba Basin — Brazil
[E80-10103] N80-23730
Sampling for area estimation: A comparison of full-frame sampling with the sample segment approach
[E80-10104] N80-23731
The application of remote sensing technology to the solution of problems in the management of resources in Indiana — pheasant habitats in Benton County, soil mapping in Jasper County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23738
Corn/soybean decision logic: Improvements and new crops — Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
Research for information extraction from aerial imagery
[AD-A080744] N80-23749
Applications of digital display in photointerpretation and digital mapping
[AD-A081091] N80-23751
Interpreting land use change through satellite imagery — Great Plains and Southeastern Alluvium Coast and Tidewater regions
[PB80-127277] N80-23784
Constant magnification optical tracking system
[NASA-CASE-NPO-14813-1] N80-24152

PHOTOIONIZATION
The physics of the photodeposition phase of the NRL master code for the disturbed E and F regions
[AD-A081776] N80-23916
Studies of laser selective excitation of atoms — radiative lifetimes, plasma diagnostics, and vapor ionization
[UTIAS-229] N80-24138
Solar photo rate coefficients — monatomic gases and metastable states
[LA-8085-MS] N80-24243

PHOTOLYSIS
Photolytic decomposition of water into oxygen and hydrogen as an alternative energy utilization of households and small consumers
[ESA-TT-582] N80-23865

PHOTOMAPPING
LANDSAT's role in state coastal management programs --- New Jersey and Texas
[E80-10101] N80-23728
LANDSAT'S role in HUD 701 programs --- New Jersey and South Dakota
[E80-10102] N80-23729
Remote sensing of aquatic plants --- Lake Marion, South Carolina, Lake Seminole, Florida, Ross Barnett Reservoir, Mississippi, and Lake Boeuf and Lake Theriot, Louisiana
[AD-A081737] N80-23754
PHOTON ABSORPTIOMETRY
Multiquantum ultraviolet excitation of atoms and molecules N80-24135
PHOTON DENSITY
Solar photo rate coefficients --- monatomic gases and metastable states
[LA-8085-MS] N80-24243
PHOTOSENSITIVITY
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells
[LBL-9916] N80-23785
PHOTOSYNTHESIS
Photochemistry and enzymology of photosynthesis
[COO-3326-82] N80-23965
Studies of photosynthetic membranes using chlorophyll fluorescence lifetimes
[LBL-9795] N80-23966
PHOTOTHERMAL CONVERSION
Solar thermal repowering utility value analysis
[SERI/TR-8016-1] N80-23814
PHOTOVOLTAIC CELLS
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells
[LBL-9916] N80-23785
Design of low-cost structures for photovoltaic arrays. Volume 2: Technical studies and appendices
[SAND-79-7002-VOL-2] N80-23837
Low cost structures for photovoltaic arrays
[SAND-80-0142C] N80-23853
Solar photovoltaic project: Materials, and testing activities
[COO-4694-60] N80-23855
PHOTOVOLTAIC CONVERSION
Non-Concentrating collectors for solar heating applications (medium temperature air heaters based on durable transparent films)
[ALO-4147-T1] N80-23817
Analysis and design of a 100-kilowatt solar photovoltaic flat-panel power system for a machining and metalworking facility in Columbus, Ohio. Phase 1: Photovoltaic flat panel application experiment
[DOE/ET/23055-1] N80-23860
PHYSICAL CHEMISTRY
Chemical physics of charge mechanisms in nonmetallic spacecraft materials
[AD-A081487] N80-23363
PHYSICAL EXERCISE
Time for recovery from successive bouts of exercise as measured by changes in the anaerobic threshold: A comparison of recovery intervals of 24 and 48 hours N80-23970
PHYSICAL FITNESS
Time for recovery from successive bouts of exercise as measured by changes in the anaerobic threshold: A comparison of recovery intervals of 24 and 48 hours N80-23970
PHYSIOLOGICAL EFFECTS
Influence of experimental hypokinesia on gastric secretory function
[NASA-TM-76034] N80-23974
Procedure of practical exercise with students on the pathogenic effect of accelerations on the organism
[NASA-TM-76120] N80-23976
PHYSIOLOGY
Ideas of I. M. Sechenov in aviation and space medicine
[NASA-TM-75976] N80-23973
PIEZOELECTRIC TRANSDUCERS
Transducer arrays suitable for acoustic imaging
[AD-A080970] N80-23579
PIEZOELECTRICITY
Piezoelectricity in polyacrylonitrile --- as a function of temperature
[AD-A081250] N80-24190
PILOT PERFORMANCE
Air combat maneuvering performance measurement
[AD-A077429] N80-23336
A discriminant analysis of pilot performance prediction and selection for air-to-air combat N80-23984
PILOT SELECTION
A discriminant analysis of pilot performance prediction and selection for air-to-air combat N80-23984
PILOTS (PERSONNEL)
Possibilities of forecasting hypercholesterinemia in pilots
[NASA-TM-76087] N80-23975
PINS
The actuated latch pin and its development N80-23502
PIPE FLOW
Data structures for calculating flows in storm sewer systems
[NPL-NACS-20/79] N80-23617
Jet injections for optimum mixing in pipe flow
[PB80-128960] N80-23619
PIPELINES
Analysis of ultrasonic flowmeters for leak detection in liquid hydrocarbon pipelines
[AD-A081791] N80-24132
PIPELINING (COMPUTERS)
A dynamically reconfigurable distributed computing system --- integrating pipelining and parallel processing N80-23989
PIVOTS
Triple-axis common-pivot arm wrist device for manipulatvie applications N80-23506
PLANAR STRUCTURES
Study and development of a computer program for analysis of SAR planar array antennas
[S-110-02] N80-23555
PLANETARY MAPPING
Improved coordinates of features in the vicinity of the Viking lander site on Mars
[NASA-CR-153193] N80-24236
PLANETARY SURFACES
Mars
[TUM-LRT-KB-13/77] N80-24237
PLANTS (BOTANY)
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748
Remote sensing of aquatic plants --- Lake Marion, South Carolina, Lake Seminole, Florida, Ross Barnett Reservoir, Mississippi, and Lake Boeuf and Lake Theriot, Louisiana
[AD-A081737] N80-23754
PLASMA ACCELERATORS
Collective drag experienced by an electron beam in the pure runaway regime
[AD-A081116] N80-24145
PLASMA CHEMISTRY
Charge transfer processes in astrophysical plasmas N80-24230
PLASMA CONDUCTIVITY
Effects of impurity radiation on reversed-field pinch evolution N80-24164
PLASMA CONTROL
Transient field reversal with a proton layer --- for plasma confinement
[AD-A081724] N80-24169
PLASMA DIAGNOSTICS
Studies of laser selective excitation of atoms --- radiative lifetimes, plasma diagnostics, and vapor ionization
[UTIAS-229] N80-24138
Elimination of defects in plasma polymerized films used in laser fusion targets
[UCID-18324] N80-24165
Remarks on the use of deposition probes for analysis of tokamak boundary-layer plasmas
[ORNL/TM-7034] N80-24173
PLASMA PHYSICS
Magnetic fusion energy and computers: The role of computing in magnetic fusion energy research and development
[DOE/ER-0033] N80-23838
A high power inductively coupled plasma torch and impedance matching network
[AD-A080906] N80-24166
PLASMA PINCH
Velocity distribution in a pinched beam
[UCID-18303] N80-24177
PLASMA POWER SOURCES
DOE/JPL advanced thermionic technology program
[NASA-CR-163134] N80-23818
PLASMA PROBES
Remarks on the use of deposition probes for analysis of tokamak boundary-layer plasmas
[ORNL/TM-7034] N80-24173
PLASMA SPRAYING
Significance of thermal contact resistance in two-layer thermal-barrier-coated turbine vanes
[NASA-TM-81483] N80-23310
Preliminary study of methods for providing thermal shock resistance to plasma-sprayed ceramic gas-path seals
[NASA-TP-1561] N80-23453
PLASMAS (PHYSICS)
Study of the general plasma characteristics of a high power multifilament ion source
[LBL-8940] N80-24178
Charge transfer processes in astrophysical plasmas N80-24230
PLASTIC DEFORMATION
Elastic-plastic deformation at finite strain N80-23672
Some comments on the endochronic theory of plasticity
[AD-A081825] N80-23689
PLASTICS
Program to study SIC fiber reinforced glass matrix composites
[AD-A077638] N80-23379
Some comments on the endochronic theory of plasticity
[AD-A081825] N80-23689
PLATES (STRUCTURAL MEMBERS)
Floating nut retention system
[NASA-CASE-MSC-16938-1] N80-23653
Recent research in composite and sandwich plate dynamics N80-24252
PLUMES
Analysis of experiments on the effects of jet plumes on pressure distribution over a cylindrical afterbody at transonic speeds
[AD-A081647] N80-23259
The chemical transformation of sulfur dioxide to sulfate in the plume of the coal-burning Keystone power plant N80-23873
An investigation into the initial mixing and dilution of identical plumes from multiple stack configurations
[BU-233] N80-23902
POINTING CONTROL SYSTEMS
A precision bearing gimbal system for the Teal Ruby program N80-23508
POLAR COORDINATES
Improved coordinates of features in the vicinity of the Viking lander site on Mars
[NASA-CR-153193] N80-24236
POLARIMETERS
A polarimeter for the high resolution ultraviolet spectrometer/polarimeter --- Solar Maximum Mission N80-23520
POLISHING
Method of forming a sharp edge on an optical device
[NASA-CASE-GSC-12348-1] N80-24149
POLLUTION
Potential air quality impact of geothermal power production in the Imperial Valley
[UCRL-52797] N80-23878
POLLUTION CONTROL
Mathematical models for atmospheric pollutants. Appendix D: Available air quality models
[EPRI-EA-1131-APP-D] N80-23884
Environmental standards for coal conversion processes. Volume 1: Most stringent, federal, and selected state regulations
[PB80-126980] N80-23904

Air quality criteria for ozone and other photochemical oxidants
[PB80-124753] N80-23905

POLLUTION MONITORING
Source assessment: Chlorinated hydrocarbons manufacture --- pollution monitoring
[PB80-138209] N80-23418
Seasonal and geographical distribution of primary amines in Houston atmosphere N80-23872
Evaluation of empirical atmospheric diffusion data
[NUREG-CR-0789] N80-23879
Monitoring dust concentrations. Modifications to the dust monitor FH62A
[IG-TNO-F-1468] N80-23886
Project filter holder. Tests on 25 mm dust filter holders
[IG-TNO-F-1638] N80-23887
Air pollution at Schouwen-Duiveland, 1976 --- the Netherlands
[IG-TNO-G-679] N80-23891
Air pollution in Delft, 1977
[IG-TNO-G-764] N80-23892
NOx and O3. Flushing: Air pollution in 1977 --- in the Netherlands
[IG-TNO-G-765] N80-23893
Air pollution studies in the Nieuwe-Waterweg region using deposit gages, 1977 data --- Netherlands
[IG-TNO-G-771] N80-23897
SO2 measurements in Rotterdam: Volumetric SO2 determinations, April 1977 to March 1978
[IG-TNO-G-794] N80-23898
Measuring techniques for NO2
[IG-TNO-G-852] N80-23899
PAN: Measurements at Delft in 1974
[IG-TNO-G-866] N80-23900
Characterization of visibility-reducing aerosols in the Southwest. Project VISTA
[PB80-139041] N80-23929

POLYBUTADIENE
Stress-birefringence-strain relations in polymer networks with specially designed structures
N80-23451

POLYCRYSTALS
Photovoltaic mechanisms in polycrystalline thins-film solar cells
[DSE/3412-T1] N80-23834

POLYGONS
Algorithms for testing convexity of digital polygons
[AD-A081476] N80-24057

POLYMER CHEMISTRY
Processing mechanisms, structure and morphology of high temperature polymeric alloys, part 2
[AD-A080068] N80-23457
Preparation of polymers using metal-carbenes
[AD-A080891] N80-23458
The role of chemical bonding in adhesion
[AD-A081661] N80-23462
Structure modification of fluorocarbon ether bibenzoxazole polymers to improve hydrolytic stability
[AD-A078954] N80-23466
Dynamic mechanical measurement of polyphenylsulfone (Radel)
[AD-A077281] N80-23467

POLYMERIC FILMS
Reverse osmosis membrane of high urea rejection properties --- water purification
[NASA-CASE-ARC-10980-1] N80-23452
Elimination of defects in plasma polymerized films used in laser fusion targets
[UCID-18324] N80-24165

POLYMERIZATION
Preparation of polymers using metal-carbenes
[AD-A080891] N80-23458
The chemistry of silicone resins, volume 1. Citations from the NTIS data base
[PB80-804362] N80-23469

POLYMERS
Chemical physics of charge mechanisms in nonmetallic spacecraft materials
[AD-A081487] N80-23363
Chelate-modified polymers for atmospheric gas chromatography
[NASA-CASE-ARC-11154-1] N80-23383
Processing mechanisms, structure and morphology of high temperature polymeric alloys, part 2
[AD-A080068] N80-23457

POLYNOMIALS
On the Diophantine equation 1k + 2k + ... + xk + R(x) = yz
[MC-ZW-113/78] N80-24094

POLYPHENYLS
Dynamic mechanical measurement of polyphenylsulfone (Radel)
[AD-A077281] N80-23467

POLYVINYL CHLORIDE
Torque rheometers, application of the method. Part 1: Unplasticized PVC
[DRIC-TRANS-5585-PT-1] N80-23636

POPULATION THEORY
Prediction, estimation and model selection for multivariate normal populations
[TR-44] N80-24043
On a class of elliptic singular perturbations with applications in population genetics
[MC-TW-184/78] N80-24087

POROSITY
Formation of porous surface layers in reaction bonded silicon nitride during processing
[NASA-TM-81493] N80-23456

POROUS MATERIALS
Numerical analysis of temperature and flow effects in a dry, two-dimensional, porous-media reservoir used for compressed air energy storage
[PNL-3047] N80-23823

PORTABLE EQUIPMENT
Global Positioning Systems (GPS). Manpack/Vehicular User Equipment (MVUE), volume 1
[AD-A076482] N80-23289
Development of a microprocessor-based instrument for static testing small rocket engines
[AD-A081083] N80-23367
Basic studies for a new communication network. Part B: Mobile radio telephone
[BMFT-FB-T-79-08] N80-23552

POSITION INDICATORS
A flight investigation of system accuracies and operational capabilities of a general aviation/air transport area navigation system (RNAV)
[AD-A081646] N80-23288

POSITIONING
The design and application of an antenna positioner mechanism for Intelsat-5 series communication satellite N80-23521

POSITRONS
Positron emission tomography of the heart
[UCLA-12-1232] N80-23980

POSTURE
On the preservation of equilibrium in the orthograde and inverted positions of the body
[NASA-TM-76141] N80-23977

POTASSIUM
Mass transport in molten-salt electrochemical systems
[ORNL/MIT-290] N80-23400

POTENTIAL ENERGY
Laminated composite disc flywheel development
[UCRL-15154] N80-23843

POTENTIAL FLOW
A higher order surface singularity method for the axisymmetric inverse problem
[AD-A081797] N80-23604

POTENTIAL THEORY
Investigation of three-dimensional subsonic flow in straight cascades by means of potential flow calculations and experiments
[DFVLR-FB-79-09] N80-23264

POTOMAC RIVER VALLEY (MD-VA-WV)
Land use intensity and water quality --- of watersheds tributary to the Potomac River N80-23714

POWDER METALLURGY
Power metallurgy of titanium and titanium alloys. Citations from the Engineering Index data base
[PB80-805161] N80-23450
The significance of the fatigue strength in the powder metallurgy
[ICAF-1134] N80-23676

POWER AMPLIFIERS
Cosmos. Meteosat: Meteorological Data Distribution (MDD) on Meteosat
[REPT-2786/85-TEA] N80-23353

POWER EFFICIENCY
Current generation with low-frequency waves
[PPPL-1624] N80-23581

POWER LINES
Field tests of the Liberty-Mead transmission system
[PB80-125610] N80-23591

POWER SPECTRA
Hawaii wind power survey: Fixed station data
[UHMET-79-15] N80-23948

PRECIPITATION (METEOROLOGY)
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

PRECIPITATION HARDENING
Superposition of alloy hardening, strain hardening, and dynamic recovery
[CONF-790801-6] N80-23436

PREDICTION ANALYSIS TECHNIQUES
Prediction, estimation and model selection for multivariate normal populations
[TR-44] N80-24043

PRESSURE DISTRIBUTION
A study of panel loads and centers of pressure of three different cruciform aft-tail control surfaces of a wingless missile from Mach 1.60 to 3.70
[NASA-TM-81787] N80-23251
Analysis of experiments on the effects of jet plumes on pressure distribution over a cylindrical afterbody at transonic speeds
[AD-A081647] N80-23259
Pressure distribution measurements on wedges at subsonic and transonic velocities --- in a transonic wind tunnel
[ESA-TT-554] N80-23267
Aerodynamic computer code for computing pressure loads on a missile at high supersonic speeds and generalized altitudes
[AD-A081596] N80-23351
Update on the low wave number content of TBL pressure fields N80-24249

PRESSURE EFFECTS
Peak wind loads on cladding panels and their dependence upon panel size
[OUEL-1286/79] N80-23708

PRESSURE MEASUREMENTS
Surface pressure measurements at two tips of a model helicopter rotor in hover
[NASA-CR-3281] N80-23252
Hypersonic heat transfer test program in the VKI longshot facility
[AD-A081467] N80-23257
Afterbody drag and base pressure measurements on a body of revolution at angles of incidence up to alpha = 25 deg at subsonic and transonic Mach numbers --- transonic wind tunnel measurements
[ESA-TT-569] N80-23268
Wind tunnel investigation of an all flush orifice air data system for a large subsonic aircraft --- conducted in a Langley 8 foot transonic pressure tunnel
[NASA-TP-1642] N80-23304
Flight test evaluation of airborne tire pressure indicating systems
[AD-A081598] N80-23305
Comparative measuremnets in four European wind tunnels of the unsteady pressures on an oscillating model
[AGARD-R-673] N80-23338
Study of an experimental probe for the measurement of the acoustic pressure inside an airflow
[ONERA-NT-1979-5] N80-24133

PRESSURE SENSORS
Study of an experimental probe for the measurement of the acoustic pressure inside an airflow
[ONERA-NT-1979-5] N80-24133

PRESSURE VESSELS
Behavior of deep flaws in a thick-wall cylinder under thermal shock loading
[CONF-791123-3] N80-23697

PRINTING
Initial conceptualization and characterization of a Navy automated publishing, volume 2
[AD-A080479] N80-24203

PROBABILITY DENSITY FUNCTIONS
Modern methods of multiple spectral density estimation
[AD-A081172] N80-24058

PROBABILITY DISTRIBUTION FUNCTIONS
Bivariate normal, conditional and rectangular probabilities: A computer program with applications
[NASA-TM-81350] N80-24099

Transformation of a discrete distribution to near normality
[AD-A080886] N80-24104
The selection of an extreme-value distribution
[AD-A080884] N80-24105

PROBABILITY THEORY
Probability modeling and estimation for hourly variation of air pollution concentrations N80-23870
Queueing networks
[AD-A081257] N80-24035
Some results on sojourn times in acyclic Jackson networks, revision
[AD-A080737] N80-24036
A note on the median of the binomial distribution
[MC-SW-59/78] N80-24081
Nonuniformity of the convergence of location estimators
[MC-SW-60/78] N80-24082
The efficiency of three tests for linear hypotheses concerning two probabilities
[MC-SW-62/78] N80-24084
On the edge-coloring property for the hereditary closure of a complete uniform hypergraph 2
[MC-ZW-106/78] N80-24088
Nonparametric estimation based on censored observations of a Markov renewal process
[MC-SW-64/78] N80-24113

PROBLEM SOLVING
Clarification process: Resolution of decision-problem conditions
[NASA-TM-81193] N80-23985
Automatic factorization of generalized upper bounds in large scale optimization problems
[AD-A081761] N80-24006
A globally convergent condensation method for geometric programming
[AD-A081067] N80-24019
Task reduction systems
[MC-IW-95/78] N80-24020
Boundary conditions for the numerical solution of elliptic equations in exterior regions
[NASA-CR-153185] N80-24044
Solving staircase linear programs by the simplex method. 1: Inversion
[AD-A081713] N80-24050
Two papers on graph embedding problems
[AD-A081449] N80-24056
Separating variables in two-way diffusion equations
[PPPL-1596] N80-24066
Regularization and generalized inverse solutions of integral equations of the first kind in reproducing kernel Hilbert spaces
[CSIR-TWISK-88] N80-24118

PROCESS CONTROL (INDUSTRY)
Science base for materials processing: Selected topics --- conferences
[PB80-122948] N80-23369
Development of the steam-iron process for hydrogen production
[FE-2435-39] N80-23483
Test and evaluate the TRI-GAS low-Btu coal gasification process
[FE-2798-66] N80-23484
Research and evaluation of biomass resources/conversion/utilization systems (market/experimental analysis for development of a data base for a fuels from biomass model)
[COO-5022-9] N80-23486
Research and evaluation of biomass resources/conversion/utilization systems (market/experimental analysis for development of a data base for a fuels from biomass model)
[COO-5022-8] N80-23487

PRODUCT DEVELOPMENT
Development of permanent magnet alloys
[BMFT-FB-T-79-23] N80-23443
Video telephone system with data compression for increased commercial requirements
[BMFT-FB-T-79-01] N80-23550
Technology for the monolithic integration of UHF devices
[BMFT-FB-T-79-13] N80-23553
Development of current converters for switching and regulating tasks in energy technology
[BMFT-FB-T-79-12] N80-23585
Cell module and fuel conditioner development
[NASA-CR-159828] N80-23768
Cell module and fuel conditioner
[NASA-CR-159875] N80-23769
Automated array assembly, phase 2
[NASA-CR-153191] N80-23770
Heliostat design cost/performance tradeoffs
[SAND-79-8248] N80-23806

PRODUCTION ENGINEERING
Global Positioning Systems (GPS). Manpack/Vehicular User Equipment (MVUE), volume 1
[AD-A076482] N80-23289
Fabrication and properties of a pressureless sintered silicon nitride based on Y2O3 as sintering aid N80-23381
Sintering of silicon nitride in a powder bed N80-23382
Photolithographic techniques for surface acoustic wave saw devices. Volume 4: Technical and operational parts 4 and 5
[AD-A081126] N80-23571
Development of pulsed processes for the manufacture of solar cells
[NASA-CR-153188] N80-23771
Analysis of the effects of impurities in silicon
[NASA-CR-163133] N80-23772
Development and fabrication of a solar cell junction processing system
[NASA-CR-153194] N80-23773
Photovoltaic mechanisms in polycrystalline thins-film solar cells
[DSE/3412-T1] N80-23834
Development of new technologies for ultra-precise large-scale astronomical instruments, in particular mirror telescopes
[BMFT-FB-T-79-10] N80-24163

PRODUCTION PLANNING
Deterministic production planning: Algorithms and complexity
[MC-BW-93/78] N80-24116

PROGRAM VERIFICATION (COMPUTERS)
Digital simulation of dynamic processes in radiometer systems --- microwave radiometers
[NASA-CR-159266] N80-23563
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Acceptance test procedures
[E80-10097] N80-23724
Techniques for program verification N80-24001
Honeywell information systems MULTICS version 4.1
[PB80-126071] N80-24208

PROGRAMMING LANGUAGES
Non-numerical applications of computer programming in the construction of problem oriented languages
[AD-A081673] N80-24009
Computer-assisted instruction in the context of the advanced instructional system. Part 1: Authoring support software
[AD-A081071] N80-24015

PROJECT MANAGEMENT
Solar energy program evaluation: An introduction
[SERI/TR-51-294] N80-23798
Matrix management for aerospace 2000
[NASA-TM-81509] N80-24200
The management of information flow in a high technology development environment
[PNR-90002] N80-24206

PROJECT PLANNING
Oceanographic remote sensing: A position paper --- Navy
[AD-A081494] N80-23752
Environmental development plan for biomass energy systems
[DOE/EDP-0032] N80-23876
Environmental development plan: Geothermal energy systems
[DOE/EDP-0036] N80-23877
Technical information dissemination plan for the US Department of Energy, ETS/Solar Divisions
[SERI/SP-69-071] N80-24205

PROJECTILES
A simple camera system for photography of projectiles in flight under daylight conditions
[PHL-1978-51] N80-23634

PROPANE
Electro-oxidation of hydrogen and propane in strong organic acid electrolytes N80-23392

PROPELLANT COMBUSTION
A primitive variable computer model for combustion within solid fuel ramjets
[AD-A081081] N80-23319

PROPELLANT STORABILITY
Surveillance Report. Stage 1, dissected motors, phase 11: Propellant component testing
[AD-A081535] N80-23366

PROPORTIONAL COUNTERS
ORNL 10-m small-angle X-ray scattering camera
[ORNL/TM-6342] N80-23630

PROPRIOCEPTION
On the preservation of equilibrium in the orthograde and inverted positions of the body
[NASA-TM-76141] N80-23977

PROPULSION
Turbopropulsion combustion technology assessment
[AD-A080748] N80-23323
Cost analysis of the propulsion of a payload transfer module for shuttle/Spacelab applications on the basis of hybrid rocket engines
[TUM-LRT-KB-77/19] N80-23368

PROPULSION SYSTEM CONFIGURATIONS
Cost analysis of the propulsion of a payload transfer module for shuttle/Spacelab applications on the basis of hybrid rocket engines
[TUM-LRT-KB-77/19] N80-23368
The impact of fuels on aircraft technology through the year 2000
[NASA-TM-81492] N80-23472

PROPULSIVE EFFICIENCY
Static calibration of a two-dimensional wedge nozzle with thrust vectoring and spanwise blowing
[NASA-TM-81161] N80-23317

PROTECTION
Energy storage technology-environmental implications of large scale utilization
[LA-UR-79-3098] N80-23801

PROTECTIVE COATINGS
Development of a special purpose spacecraft coating, phase 4
[NASA-CR-160586] N80-23455

PROTEIN METABOLISM
Relationship between urinary 3-methylhistidine excretion and components of body composition in man N80-23972

PROTON BEAMS
Transient field reversal with a proton layer --- for plasma confinement
[AD-A081724] N80-24169

PROTONS
Solar microwave bursts accompanying proton events
[AD-A081461] N80-24241

PSYCHOLOGICAL FACTORS
Psychological selection of Spacelab payload specialists. The evaluation of German applicants
[ESA-TT-586] N80-23987

PSYCHOLOGY
Clarification process: Resolution of decision-problem conditions
[NASA-TM-81193] N80-23985

PUBLIC HEALTH
Assessment of potential exposure to friable insulation materials containing asbestos
[NASA-TM-81435] N80-23875

PULSE COMMUNICATION
Basic studies for a new communication network. Part A: An integrated communication system with decentralized switching
[BMFT-FB-T-79-07-PT-A] N80-23551
A study of spectrum efficient modulation techniques for digital satellite communications
[Y/212/5086] N80-23556

PULSE RATE
Pulse transducer with artifact signal attenuator --- heart rate sensors
[NASA-CASE-FRC-11012-1] N80-23969

PULSED LASERS
Induced evaporation of metal from an aluminum surface by a normal pulse neodymium laser
[AD-A081601] N80-23638

PUMPS
Development of a rotary high pressure displacement pump for reversed osmosis systems for seawater desalination
[BMFT-FB-M-78-08] N80-23663

PYROTECHNICS
Exploring new concepts for elucidating processes occurring in pyrotechnic flares and for generating aerosol dispersions
[AD-A080731] N80-23473

Q

QUADRATIC EQUATIONS
Copositive matrices and definiteness of quadratic forms subject to homogeneous linear inequality constraints
[CSIR-TWISK-89] N80-24047
QUADRATIC PROGRAMMING
Finite criteria for conditional definiteness of quadratic forms
[CSIR-TWISK-115] N80-24045
QUADRATURES
Quadrature subroutines for splines and B-splines
[SAND-79-1825] N80-24067
QUANTITATIVE ANALYSIS
Quantitative fractography of a fatigued Ti-28 w/o V alloy
[AD-A079813] N80-23431
The LASL nondestructive testing group
[LA-UR-79-3071] N80-23668
QUANTUM CHEMISTRY
Medium effects of fluorescence quantum yields and lifetimes for coumarin laser dyes
[AD-A081748] N80-23640
QUARKS
Synthesis of baryons from unconfined quarks
[ORO-3992-371] N80-24147
QUARTZ
Quartz ball value
[NASA-CASE-NPO-14473-1] N80-23654
QUARTZ CRYSTALS
Research on the pertinent parameters of a quartz oscillator
[ONERA-NT-1979-10] N80-23588
QUATERNARY ALLOYS
InGaAsP quarternary materials for near infrared detector and laser applications
[AD-A078320] N80-24187
QUEUEING THEORY
Control of entry to a queueing system N80-24033
Queueing networks
[AD-A081257] N80-24035
Some results on sojourn times in acyclic Jackson networks, revision
[AD-A080737] N80-24036
The M/G/1 queue with instantaneous Bernoulli feedback
[AD-A081256] N80-24038
An algorithm for average costs denumerable state semi-Markov decision problems with applications to controlled production and queueing systems
[MC-BW-94/78] N80-24039
A SIMULA program for investigating a class of queueing networks
[FUB-40-1978] N80-24040
A nonlinear vector finite difference scheme
[MC-BW-89/78] N80-24069
Analysis of heuristics for sequencing jobs on one machine with release dates and delivery times
[MC-BW-95/78] N80-24072
QUIET ENGINE PROGRAM
OSCEE fan exhaust bulk absorber treatment evaluation
[NASA-TM-81498] N80-23314

R

RADAR
A review of representation functions for probability of detection
[AD-A081734] N80-23545
RADAR ANTENNAS
Ku band deployed assembly and gimbal
N80-23510
RADAR DATA
Functional and operational advances in the AFGL rocket trajectory system-I
[AD-A081447] N80-23349
RADAR ECHOES
The Urbana coherent-scatter radar: Synthesis and first results
[NASA-CR-153186] N80-23531
Maximum entropy spectral analysis and radar signal processing
[AD-A081343] N80-23548
RADAR EQUIPMENT
Radar video pulse recording system
[AD-A081156] N80-23533
Video tape recording techniques for Seasat radar data
[AD-A081152] N80-23622
RADAR IMAGERY
Processing techniques development, volume 3. Part 2: Data preprocessing and information extraction techniques
[E80-10115] N80-23742
RADAR REFLECTORS
Application of graphite/epoxy composites for the SPS-10 radar reflector
[AD-A077530] N80-23380
RADAR TARGETS
Backscattering programs for spherical targets
[AD-A081094] N80-24131
RADAR TRACKING
Development and evaluation of adaptive techniques for reducing ionospheric-induced radar tracking errors in real time
[AD-A081460] N80-23544
RADAR TRANSMITTERS
AN/TPQ-37 transmitter tube improvements
[AD-A081393] N80-23565
AN/TPQ-37 transmitter test bed
[AD-A081591] N80-23576
RADIANCE
Nationwide forestry applications program: Corrections to forest reflectance as a function of low Sun angle and slope --- Washington County, Missouri
[E80-10100] N80-23727
Statistical retrieval of temperatures from SCR-B, at 10 to 0.4 MB
[AD-A077359] N80-23941
RADIANT FLUX DENSITY
Analysis of some laser light show effects for classification purposes
[PB80-131576] N80-23652
RADIATION ABSORPTION
Coherent transient effect studies of Rydberg atoms
[AD-A081746] N80-24140
RADIATION DAMAGE
Radiation and shielding around beam absorbers
[INTERIKO-78/7] N80-24148
RADIATION DISTRIBUTION
Boundary conditions for the numerical solution of elliptic equations in exterior regions
[NASA-CR-153185] N80-24044
RADIATION DOSAGE
Analysis of some laser light show effects for classification purposes
[PB80-131576] N80-23652
RADIATION EFFECTS
Effects of impurity radiation on reversed-field pinch evolution N80-24164
RADIATION MEDICINE
Positron emission tomography of the heart
[UCLA-12-1232] N80-23980
RADIATION SHIELDING
Radiation and shielding around beam absorbers
[INTERIKO-78/7] N80-24148
RADIATION SOURCES
Extension for increased data collection of quasi-homogeneous sources, addendum
[AD-A081557] N80-23645
RADIATIVE HEAT TRANSFER
Modeling of coupled heat transfer by radiation and convection: Application to Spacelab short module
[ESA-STM-214] N80-23361
RADIATIVE LIFETIME
Studies of laser selective excitation of atoms --- radiative lifetimes, plasma diagnostics, and vapor ionization
[UTIAS-229] N80-24138
RADIO ALTIMETERS
Study of high-altitude radar altimeter model accuracy and SITAN performance using HAAFT data
[SAND-79-1380] N80-23307
RADIO COMMUNICATION
Tactical miniature crystal osillator
[AD-A080769] N80-23572
RADIO FREQUENCIES
Plasma boundary collisionless absorption effects in the loading of RF conductors
[AD-A081115] N80-24167
RADIO FREQUENCY INTERFERENCE
Measurement of interference-to-navigation/communication avionics from cable television (CATV) systems
[AD-A081430] N80-23530
Rate statistics for radio noise from lightning
[NASA-TP-1665] N80-23933
RADIO RECEPTION
Probe signaling on fading multipath communication channels N80-23528
RADIO RELAY SYSTEMS
Performance of a very long 8 GHz microwave link
[PB80-129380] N80-23558
RADIO WAVE REFRACTION
Shuttle program: Computing atmospheric scale height for refraction corrections
[NASA-TM-81059] N80-23911
RADIOTELEPHONES
Basic studies for a new communication network. Part B: Mobile radio telephone
[BMFT-FB-T-79-08] N80-23552
RAIN
Agricultural soil moisture experiment: 1978 Colby (Kansas) data catalog and documentation --- Thomas County, Kansas
[E80-10096] N80-23725
RAIN IMPACT DAMAGE
Response of infrared-transparent materials to raindrop impacts --- zinc sulfides
[AD-A081542] N80-23374
RAMAN SPECTRA
Characterization of passive films using infrared and Raman spectroscopy
[AD-A081240] N80-23397
Coherent Raman combustion diagnostics
[SAND-79-8807] N80-23401
Coherent Anti-Stokes Raman scattering at electronic resonance: Application to iodine
[ONERA-NT-1979-4] N80-23404
Comparative Raman study of mixed-alkali and similar ion exchanged glasses
[AD-A080840] N80-23463
RAMAN SPECTROSCOPY
Raman spectroscopy of solids
[AD-A081517] N80-23396
RAMJET ENGINES
A primitive variable computer model for combustion within solid fuel ramjets
[AD-A081081] N80-23319
RANDOM PROCESSES
Digital simulation of dynamic processes in radiometer systems --- microwave radiometers
[NASA-CR-159266] N80-23563
RANGE (EXTREMES)
Bounds for the mean and standard deviation of linear combinations of order statistics
[MC-SW-58/78] N80-24111
RANGELANDS
Categorization of watershed land cover units with LANDSAT data --- semiarid watershed in Utah
N80-23712
RANK TESTS
The method of n rankings when the underlying distributions are discrete
[CSIR-TWISK-108] N80-24100
On the choice of variance for the log rank test
[AD-A080296] N80-24101
RARE GASES
High pressure noble gas alkali vapor mixtures and their visible and infrared excimer bands
[AD-A081803] N80-23643
RAREFACTION
Applications of random-choice method to problems in shock and detonation-wave dynamics
[AD-A081304] N80-23603
RAY TRACING
Development of a three-dimensional seismic data acquisition and processing system
[BMFT-FB-T-79-22] N80-23921
RAYLEIGH SCATTERING
Atmospheric Rayleigh scattering in the ultraviolet and visible spectral region
[ESA-TT-588] N80-23926
REACTION KINETICS
Metal ion reactions with ozone and atomic oxygen
[AD-A081516] N80-23395

Application of laser-induced fluorescence for measuring reaction rate constants in H-N-C-O systems
[MPIS-13/1979] N80-23406
Formation of prompt nitrogen oxides during combustion of hydrocarbons
[ESA-TT-579] N80-23411
The effect of catalyst length and downstream reactor distance on catalytic combustor performance
[NASA-TM-81475] N80-23779
Photochemistry and enzymology of photosynthesis
[COO-3326-82] N80-23965
Studies of photosynthetic membranes using chlorophyll fluorescence lifetimes
[LBL-9795] N80-23966
Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation
[LBL-9811] N80-24142

REACTION WHEELS
An interactive computer program for sizing spacecraft momentum storage devices
[NASA-TM-81798] N80-24002

REACTOR MATERIALS
Thermal stress analysis and the effect of temperature dependence of material properties on Doublet 3 limiter design --- reactor materials
[GA-A-15626] N80-23700

REACTOR STARTUP TESTS
Development of the steam-iron process for hydrogen production
[FE-2435-39] N80-23483

REAL TIME OPERATION
The study of real-time software on space missions, volume 1
[REPT-7T40423/MEG/JCR-VOL-1] N80-24027
The study of reliability of real-time software for space missions, volume 2
[ESA-CR(P)-1270-VOL-2] N80-24028
The study of reliability of real-time software for space missions, volume 3
[REPT-7T40423/MEG/JCR-VOL-3] N80-24029
Constant magnification optical tracking system
[NASA-CASE-NPO-14813-1] N80-24152

RECEIVERS
Global Positioning System (GPS) High Dynamic User Equipment (HDUE). Volume 3: Set description
[AD-A076481] N80-23291
Predictions of GPS X-Set performance during the places experiment
[AD-A081552] N80-23292
Passive infrared surveillance Part 2: Threshold-crossing receivers
[AD-A081723] N80-24159

RECRYSTALLIZATION
Laser annealing: Surface epitaxial crystallization, spatial variations measurement, dynamics of annealing and other applications N80-24181
Model of the recrystallization mechanism of amorphous silicon layers created by ion implantation
[LBL-9990] N80-24196

RECTENNAS
Electrostatic protection of the Solar Power Satellite and rectenna
[NASA-CR-161438] N80-23348

REDUCTION (CHEMISTRY)
Oxygen reduction of a graphite paste and a catalyst loaded graphite paste electrode N80-23390

REENTRY SHIELDING
Adjustable high emittance gap filler --- reentry shielding for space shuttle vehicles
[NASA-CASE-ARC-11310-1] N80-23454

REENTRY VEHICLES
State and parameter estimation for reentry vehicle lateral motion N80-23345

REFLECTANCE
Nationwide forestry applications program: Corrections to forest reflectance as a function of low Sun angle and slope --- Washington County, Missouri
[E80-10100] N80-23727

REFLECTORS
Constant magnification optical tracking system
[NASA-CASE-NPO-14813-1] N80-24152

REFRACTIVITY
Gladstone-Dale constant for CF4 --- experimental design
[NASA-TM-80228] N80-24151

REFRACTORY MATERIALS
Adjustable high emittance gap filler --- reentry shielding for space shuttle vehicles
[NASA-CASE-ARC-11310-1] N80-23454

REFRIGERATING MACHINERY
Study and detail design of the engineering model of a vapor compressor to be used in space
[F/W-FO-1498] N80-23664

REFRIGERATORS
Cryogenic cooling study for the advanced limb scanner
[NASA-CR-159250] N80-23621

REGIONAL PLANNING
LANDSAT'S role in HUD 701 programs --- New Jersey and South Dakota
[E80-10102] N80-23729

REGRESSION ANALYSIS
An analytical means for determination of scoring limited load capacity in sliding/rolling contact
[AD-A080984] N80-23657
Statistical retrieval of temperatures from SCR-B, at 10 to 0.4 MB
[AD-A077359] N80-23941
Efficient estimation of multivariate moving average autocovariances
[AD-A081173] N80-24059
Regression analysis for mixed cross-section and time-series data with references to some incomplete observations techniques
[MC-SW-61/78] N80-24083

REGULATORS
Centrifugal regulator for control of deployment rates of deployable elements N80-23504
Design of stochastic discrete-time linear optimal regulator
[OUEL-1288/79] N80-23589

REINFORCED PLASTICS
Fatigue characterization of composite materials
[AD-A081320] N80-23372
Definition and modeling of critical flaws in graphite fiber reinforced resin matrix composite materials
[AD-A080893] N80-23376

REINFORCEMENT (STRUCTURES)
Tensile crack exposure tests. Report 3: Laboratory evaluation of series A beams with results from 1951 to 1975
[AD-A081302] N80-23692
Interactive simulation of the progressive collapse of a building revisited
[TRITA-NA-7921] N80-23706

REINFORCING FIBERS
Program to study SIC fiber reinforced glass matrix composites
[AD-A077638] N80-23379
Dynamic mechanical properties of fiber-reinforced composite materials N80-24251

RELATIVITY
Theoretical investigation of stationary stellar systems in the Brans-Dicke theory of gravitation, with applications to perfect fluid interiors --- by modifying theory of relativity N80-24225

RELAXATION (MECHANICS)
Evaluation of the traction characteristics of three lubricants
[AD-A080966] N80-23658

RELIABILITY
A sound and complete Hoare-like system for a fragment of PASCAL
[MC-IW-97/78] N80-24022
The study of reliability of real-time software for space missions, volume 2
[ESA-CR(P)-1270-VOL-2] N80-24028
The study of reliability of real-time software for space missions, volume 3
[REPT-7T40423/MEG/JCR-VOL-3] N80-24029
On the performance of least squares estimators in type two censored accelerated life tests
[AD-A080912] N80-24103

RELIABILITY ANALYSIS
An assessment of the stability and opening characteristics of cruciform parachutes
[BU-238] N80-23276
Fuel/hydraulic transfer valve improves reliability of Atlas space launch vehicle N80-23509
The study of real-time software on space missions, volume 1
[REPT-7T40423/MEG/JCR-VOL-1] N80-24027

RELIABILITY ENGINEERING
Recovery from soft errors in triplicated computer systems operating in lock-step
[PB80-126931] N80-23999
Using executive assertions for testing
[AD-A081488] N80-24011

REMOTE HANDLING
Triple-axis common-pivot arm wrist device for manipulatvie applications N80-23506

REMOTE SENSORS
Oceanographic remote sensing: A position paper --- Navy
[AD-A081494] N80-23752
IRemote sensing methods for determination of slant range visibility
[DFVLR-FB-79-14] N80-23759
Remote Sensing and Problems of the Hydrosphere. A Focus for Future Research --- conferences
[NASA-CP-2132] N80-23956
Bioprocesses --- in the marine environment N80-23957
Global geochemical problems N80-23958
Gas and aerosol fluxes --- emphasizing sulfur, nitrogen, and carbon N80-23959
Coastal sedimentation N80-23960

REMOTELY PILOTED VEHICLES
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2D: Specific study no. 4, gyro accuracy requirements in a strap down inertial navigation system with GPS aiding for RPV missions
[AGARD-AR-147-VOL-2D] N80-23294

RESEARCH
Basic research needs in energy conservation
[LBL-9939] N80-23794

RESEARCH AND DEVELOPMENT
National Aeronautics and Space Administration Authorization Act, 1981
[S-96-719] N80-24210
NASA authorization, 1981
[GPO-59-526] N80-24211

RESEARCH FACILITIES
The LASL nondestructive testing group
[LA-UR-79-3071] N80-23668

RESEARCH MANAGEMENT
Retrospective study of selected DOD materials and structures research and development programs. Phase 1: Case history data collection
[AD-A080547] N80-24258

RESERVOIRS
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Automatic interpretation of LANDSAT data to characterize the dispersion of suspended sediments in artifical reservoirs --- Tres Marias Dam, Brazil
[E80-10110] N80-23737
Remote sensing of aquatic plants --- Lake Marion, South Carolina, Lake Seminole, Florida, Ross Barnett Reservoir, Mississippi, and Lake Boeuf and Lake Theriot, Louisiana
[AD-A081737] N80-23754

RESIDUAL STRESS
An investigation of residual stresses in simulated wing panels of 7075-T6 aluminum
[AD-A080643] N80-23680

RESONANCE
Coherent Anti-Stokes Raman scattering at electronic resonance: Application to iodine
[ONERA-NT-1979-4] N80-23404

RESOURCES MANAGEMENT
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Sybsystem (RSIS): User's guide
[E80-10088] N80-23715
Earth resources data project
[E80-10092] N80-23719
Integrated use of LANDSAT data for state resource management --- Arizona, Georgia, North Dakota, and Texas
[E80-10095] N80-23722
Texas Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Univel software user's guide
[E80-10096] N80-23723

Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Acceptance test procedures
[E80-10097] N80-23724

LANDSAT's role in state coastal management programs — New Jersey and Texas
[E80-10101] N80-23728

LANDSAT'S role in HUD 701 programs — New Jersey and South Dakota
[E80-10102] N80-23729

The application of remote sensing technology to the solution of problems in the management of resources in Indiana — pheasant habitats in Benton County, soil mapping in Jasper County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23738

RETAINING

Floating nut retention system
[NASA-CASE-MSC-16938-1] N80-23653

RETORT PROCESSING

Geokinetics in situ shale oil recovery project
[LETC-10787-25] N80-23755

REVERSE FIELD PINCH

Effects of impurity radiation on reversed-field pinch evolution N80-24164

REVERSE OSMOSIS

Reverse osmosis membrane of high urea rejection properties — water purification
[NASA-CASE-ARC-10980-1] N80-23452

Development of a rotary high pressure displacement pump for reversed osmosis systems for seawater desalination
[BMFT-FB-M-78-08] N80-23663

REVISIONS

Monitoring dust concentrations. Modifications to the dust monitor FH62A
[IG-TNO-F-1468] N80-23886

RHEOMETERS

Torque rheometers, application of the method. Part 1: Unplasticized PVC
[DRIC-TRANS-5585-PT-1] N80-23636

RICE

Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720

Variability of crop calendar stage dates — Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726

Corn/soybean decision logic: Improvements and new crops — Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744

Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

RIGID ROTORS

An analytical study of tilt proprotor aircraft dynamics in airplane cruise configuration including the effects of fuselage longitudinal rigid body motion
N80-23297

RIGID STRUCTURES

State-of-the-art report on numerical integration methods for analysis of stiff structural analysis systems N80-23681

Interactive simulation of the progressive collapse of a building revisited
[TRITA-NA-7921] N80-23706

RIGID WINGS

Investigation of a foam supported glass fiber D-box for a rigid wing hang glider
[BU-240] N80-23302

RING LASERS

Multioscillator laser gyro study
[AD-A081421] N80-23626

Passive ring resonator laser gyroscope
[AD-A081649] N80-23627

RIO GRANDE (NORTH AMERICA)

Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions — Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733

RIVER BASINS

LANDSAT reconnaissance images of the great soil region in the western part of the Paraiba Basin — Brazil
[E80-10103] N80-23730

Pointbars: A comparative examination along the large Dutch rivers — Netherlands
[REPT-2] N80-23760

ROCKET EXHAUST

Spatial radiometer, volume 1
[AD-A081584] N80-23628

ROCKET FLIGHT

Functional and operational advances in the AFGL rocket trajectory system-I
[AD-A081447] N80-23549

ROCKET NOZZLES

Analysis of experiments on the effects of jet plumes on pressure distribution over a cylindrical afterbody at transonic speeds
[AD-A081647] N80-23259

ROCKET THRUST

Cooling of high pressure rocket thrust chambers with liquid oxygen
[NASA-TM-81503] N80-23365

ROCKET-BORNE INSTRUMENTS

A rocket-borne energy spectrometer using multiple solid-state detectors for particle identification
[NASA-CR-153183] N80-23364

Spatial radiometer, volume 1
[AD-A081584] N80-23628

Sounding rocket program aeronomy: Neutral composition of the mesosphere and lower thermosphere during winter-anomaly conditions
[BMFT-FB-W-79-02] N80-23922

Research in aeronomy
[NASA-CR-153189] N80-24257

RODS

Chances and handicaps of rod-beam theories
[ESA-TT-588] N80-23705

ROTARY WINGS

Surface pressure measurements at two tips of a model helicopter rotor in hover
[NASA-CR-3281] N80-23252

ROTATING FLUIDS

Stability of modulated rotating fluids — Galerkin method N80-23595

ROTOR AERODYNAMICS

Axial flow rotor unsteady performance
N80-23308

ROTOR BLADES (TURBOMACHINERY)

Flutter stabilities in an annular cascade with supersonic relative flow
[ESA-TT-610] N80-23271

Axial flow rotor unsteady performance
N80-23308

Axial flow rotor unsteady performance
[AD-A081107] N80-23318

Millville Wind Turbine Generator: Failure analysis and corrective design modification
[RFP-2992/3533/79-3] N80-23831

ROTOR SPEED

CF6 jet engine performance improvement: New fan
[NASA-CR-159699] N80-23309

ROTORS

Dynamics of a flexible rotor-tower system
[ASRL-TR-194-1] N80-23862

RUBBER

Solar energy systems: Standards for rubber hose
[PB80-129826] N80-23868

RYDBERG SERIES

Coherent transient effect studies of Rydberg atoms
[AD-A081746] N80-24140

S

SAFETY MANAGEMENT

Environmental development plans for energy technology programs
[DOE/EDP-0062] N80-23881

SAMPLING

Sampling representations and approximations for certain functions and stochastic processes
[AD-A081533] N80-24102

SAN FRANCISCO BAY (CA)

Chabot Observatory Remote Sensing Experiments (CORSE) — determining the relationship between weather and air pollution
[UCID 18504] N80-23758

SANDWICH STRUCTURES

Elastic constants for superplastically formed/diffusion-bonded corrugated sandwich core
[NASA-TP-1562] N80-23877

Comparison of structural behavior of superplastically formed/diffusion-bonded sandwich structures and honeycomb core sandwich structures
[NASA-TM-81348] N80-23885

Studies in the theory of solids
[COO-1198-1283] N80-24194

Recent research in composite and sandwich plate dynamics N80-24252

SATELLITE ANTENNAS

The design and application of an antenna positioner mechanism for Intelsat-5 series communication satellite N80-23521

SATELLITE ATTITUDE CONTROL

Ball bearing versus magnetic bearing reaction and momentum wheels as momentum actuators
N80-23503

SATELLITE CONFIGURATIONS

Feasibility study of a Spacelab-subsatellite
[DLR-FB-77-67] N80-23352

The Magsat magnetometer boom N80-23517

SATELLITE DESIGN

Feasibility study of a Spacelab-subsatellite
[DLR-FB-77-67] N80-23352

SATELLITE LIFETIME

A study of increased reliability and lifetimes for future communications satellites, volume 1
[GTS-790174-VOL-1] N80-23356

A study of increased reliability and lifetimes for future communications satellites, volume 2
[GTS-790173-VOL-2] N80-23357

SATELLITE OBSERVATION

Oceanographic remote sensing: A position paper — Navy
[AD-A081494] N80-23752

A time variable model of Earth's albedo — for climatology studies and interpretation of satellite data
[NASA-CR-159259] N80-23935

Validation of ocean tide models from satellite altimetry
[AD-A078294] N80-23961

LASL gamma-ray burst astronomy program
[LA-UR-80-80] N80-24224

SATELLITE PERTURBATION

General perturbations theories derived from the 1965 Jane drag theory
[AD-A081264] N80-23347

SATELLITE-BORNE INSTRUMENTS

Prelaunch summary: NOAA-B launch
[NASA-TM-81060] N80-23340

Energetic particle studies: Instrumentation and analysis
[AD-A081714] N80-23350

The mechanisms of the SAMS experiment flown on Nimbus 7 with particular reference to the 2 axis scanning mirror — infrared radiometer for stratospheric and mesospheric investigations N80-23522

LASL gamma-ray burst astronomy program
[LA-UR-80-80] N80-24224

SATELLITE-BORNE PHOTOGRAPHY

Deformation of the marine inversion and the development of marine fog and stratus resulting from warm water patches, numerical modeling and verification with satellite imagery
[AD-A081089] N80-23940

Environmental satellite imagery, April 1979
[PB80-130214] N80-23951

SCALARS

On vacuum fluctuations of a scalar field in a localized region of spacetime N80-24199

SCALE HEIGHT

Shuttle program: Computing atmospheric scale height for refraction corrections
[NASA-TM-81059] N80-23911

SCANNERS

Design of an atmospheric sounding radiometer for the GOES meteorological satellite system
N80-23519

SCATTER PROPAGATION
The Urbana coherent-scatter radar: Synthesis and first results
[NASA-CR-153186] N80-23531
SCATTERING CROSS SECTIONS
Non-destructive evaluation of defects in structural materials using long-wavelength neutrons
[AD-A081097] N80-23865
Measurements of the total elastic scattering cross section for argon on argon at collision energies below four millivolts N80-24136
Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation
[LBL-9811] N80-24142
SCENE ANALYSIS
Users manual for the LANDSAT Imagery Verification and Extraction System (LIVES)
[E80-10091] N80-23716
SCHEDULING
Analysis of heuristics for sequencing jobs on one machine with release dates and delivery times
[MC-BW-95/78] N80-24072
SCHMIDT CAMERAS
Analysis of special components of the EUV-very wide angle camera
[BMFT-FB-W-79-04] N80-24160
SCIENTIFIC SATELLITES
Oceanographic remote sensing: A position paper — Navy
[AD-A081494] N80-23752
Data processing systems for accelerometer experiments on air force satellites
[AD-A080460] N80-23913
SCIENTISTS
The mathematician Gauss, seen from the point of view of a space technologist — Carl Friedrich Gauss
[TUM-LRT-KB-14/77] N80-23342
SCINTILLATION COUNTERS
The latitudinal structure of solar wind streams from radio scintillation observations
[AD-A081462] N80-24242
SCREEN EFFECT
Predictions of GPS X-Set performance during the places experiment
[AD-A081552] N80-23292
Electromagnetic penetration through a slot in a screen covered by a dielectric slab N80-23527
SEA WATER
Development of a composite reverse osmosis membrane for single pass seawater desalination
[PB80-124852] N80-23414
Development of a rotary high pressure displacement pump for reversed osmosis systems for seawater desalination
[BMFT-FB-M-78-08] N80-23963
SEARCH PROFILES
On the computational complexity of branch and bound search strategies
[AD-A081608] N80-24051
System requirements analysis for the Chemical Structure and Nomenclature System (CSNS)
[PB80-105216] N80-24207
SEARCH RADAR
Aegis spy-1 radar 5-v/60-a switching-mode power supply stability analysis: A stability analysis employing state-space averaging techniques for converter modeling
[AD-A080449] N80-23532
SEARCHING
Transforming static data structures to dynamic structures
[AD-A081438] N80-24009
SECRETIONS
Influence of experimental hypokinesis on gastric secretory function
[NASA-TM-76034] N80-23974
SECURITY
Passive intrusion detection system
[NASA-CASE-NPO-13804-1] N80-23559
SEDIMENT TRANSPORT
Automatic interpretation of LANDSAT data to characterize the dispersion of suspended sediments in artificial reservoirs — Tres Marias Dam, Brazil
[E80-10110] N80-23737
Coastal sedimentation N80-23980
SEDIMENTS
Soil mechanical tests on Pacific deep sea sediments
[BMFT-FB-M-78-02] N80-23963
SEISMIC WAVES
Attenuation of teleseismic P-waves within geothermal systems N80-23529
Gravity study of the Los Alamos area, New Mexico
[LA-8154-MS] N80-23820
Further development of seismic methods. Three-dimensional migration/approximation procedure
[BMFT-FB-T-79-18] N80-23924
Further development of seismic methods: Three-dimensional velocity determinations
[BMFT-FB-T-79-19] N80-23925
SEISMOGRAPHS
Development of a three-dimensional seismic data acquisition and processing system
[BMFT-FB-T-79-22] N80-23921
SEISMOLOGY
The frequency dependence of Q — anelastic attenuation in the earth N80-23907
Seismic data catalog and associated graphical capabilities
[PNL-2893] N80-23918
Comprehensive study of the seismotectonics of the eastern Aleutian arc and associated volcanic systems
[COO-3134-20] N80-23919
SELENIDES
Selenide isotope generator for the Galileo Mission: Copper/water axially-grooved heat pipe topical report
[TES-33009-44] N80-23829
SEMANTICS
A sound and complete Hoare-like system for a fragment of PASCAL
[MC-IW-97/78] N80-24022
SEMICONDUCTOR DEVICES
Signal processing using surface acoustic wave devices N80-23525
Technology for the monolithic integration of UHF devices
[BMFT-FB-T-79-13] N80-23553
Development of current converters for switching and regulating tasks in energy technology
[BMFT-FB-T-79-12] N80-23585
Techniques for low noise and high power transistors in integrated circuits
[BMFT-FB-T-79-15] N80-23587
SEMICONDUCTOR JUNCTIONS
Automated array assembly, phase 2
[NASA-CR-153191] N80-23770
Development and fabrication of a solar cell junction processing system
[NASA-CR-153194] N80-23773
SEMICONDUCTORS (MATERIALS)
Raman spectroscopy of solids
[AD-A081517] N80-23396
Laser annealing: Surface epitaxial crystallization, spatial variations measurement, dynamics of annealing and other applications N80-24181
Electronic structure of semiconducting surface inversion layers — energies of subbands N80-24183
Crystal growth of device quality GaAs in space
[NASA-CR-153190] N80-24185
Studies in the theory of solids
[COO-1199-1293] N80-24194
SEPARATED FLOW
Leeward flow over delta wings at supersonic speeds
[NASA-TM-81167] N80-23250
Development of three-dimensional turbulent boundary layers in incompressible flow with separation
[BU-239] N80-23610
SERVICE LIFE
Surveillance Report. Stage 1, dissected motors, phase 11: Propellant component testing
[AD-A081535] N80-23366
Test and evaluation of MK 37 torpedo batteries
[AD-A081642] N80-23543
SERVOMECHANISMS
The Eccentuator: A new concept in actuation N80-23501
Design and development of the quad redundant servoactuator for the space shuttle solid rocket booster thrust vector control N80-23507
SET THEORY
Some statistical techniques for climatological data
[AD-A081490] N80-23942
Uniform linear approximation in normed linear spaces
[CSIR-TWISK-114] N80-24046
Expected number of vertices of a random convex polytope. I: Integral formula and asymptotic bounds
[AD-A080191] N80-24048
Generating all maximal independent sets: NP-hardness and polynomial-time algorithms
[MC-BW-87/78] N80-24098
On the edge-coloring property for the hereditary closure of a complete uniform hypergraph 2
[MC-ZW-108/78] N80-24099
Vertex-critical subgraphs of Kneser-graphs
[MC-ZW-109/78] N80-24099
Solution of two fractional packing problems of Lovasz
[MC-ZW-110/78] N80-24091
Locating an isolated global minimizer of a constrained nonconvex program
[AD-A080180] N80-24119
SHADOWGRAPH PHOTOGRAPHY
A simple camera system for photography of projectiles in flight under daylight conditions
[PHL-1978-51] N80-23834
SHALE OIL
Geokinetics in situ shale oil recovery project
[LETC-10787-25] N80-23755
Energy from in situ processing of Antrim oil shale
[FE-2346-49] N80-23808
SHALES
Coal-shale interface detector
[NASA-CASE-MFS-23720-1] N80-23711
Dynamic fracture strength of oil shale and coal
[OUEL-1295/79] N80-23927
SHALLOW WATER
Application of shallow solar ponds for industrial process heat: Case histories
[UCRL-82367] N80-23822
SHAPES
Lighter and stronger
[AD-A081317] N80-23894
SHARPNESS
Method of forming a sharp edge on an optical device
[NASA-CASE-GSC-12348-1] N80-24149
SHEAR PROPERTIES
Shear lips on fatigue fractures in aluminum alloy sheet material
[LR-287] N80-23875
SHEAR STRENGTH
Soil mechanical tests on Pacific deep sea sediments
[BMFT-FB-M-78-02] N80-23963
SHELLS (STRUCTURAL FORMS)
Computer analysis of shells and composites
[AD-A081489] N80-23890
SHOCK ABSORBERS
Optimization techniques for shock and vibration isolator development N80-24253
SHOCK LOADS
Initiation of granular explosives by ramp waves
[SAND-79-1188C] N80-23480
SHOCK RESISTANCE
Preliminary study of methods for providing thermal shock resistance to plasma-sprayed ceramic gas-path seals
[NASA-TP-1561] N80-23453
SHOCK TESTS
Technical manual: Primary data reduction programs for the Eclipse S-200/230 shock and vibration measurement systems
[SAND-79-8054] N80-23809
SHOCK WAVE GENERATORS
Laser-driven shockless experiments at extreme high pressures — determining equation of state data
[UCRL-83372] N80-23649
SHOCK WAVE INTERACTION
Oscillations of the supersonic flow at an area of abrupt increase in duct cross-section
[MPIS-23/1978] N80-23283
SHOCK WAVES
Shock and vibration performance of an epoxy chocking compound
[AD-A078498] N80-23469
The Shock and Vibration Digest, volume 11, no. 9
[AD-A074320] N80-23490
Measured and predicted shock shapes and aerodynamic coefficients for blunted cones at incidence in air at Mach 5.9
[NASA-TP-1652] N80-23680

Shock-boundary layer interaction effects in transonic flow fields
[AD-A080886] N80-23601
Applications of random-choice method to problems in shock and detonation-wave dynamics
[AD-A081394] N80-23603
The Shock and Vibration Digest, volume 11, no. 11
[AD-A079375] N80-23869
The Shock and Vibration Digest, volume 11, no. 10
[AD-A078374] N80-24250
The Shock and Vibration Digest, volume 11, no. 2
[AD-A079549] N80-24254

SHORELINES
LANDSAT's role in state coastal management programs --- New Jersey and Texas
[E80-10101] N80-23729

SHORT TAKEOFF AIRCRAFT
Estimation of wind shear and thrust loss during STOL aircraft landing approach N80-23296

SIGNAL ANALYSIS
Nonlinear system identification study. Part 1: implementation feasibility study
[AD-A081464] N80-23890
Analysis of lunar seismic signals: Determination of instrumental parameters and seismic velocity distribution N80-24232

SIGNAL DETECTION
Probe signaling on fading multipath communication channels N80-23529

SIGNAL DETECTORS
Pulse transducer with artifact signal attenuator --- heart rate sensors
[NASA-CASE-FRC-11012-1] N80-23869

SIGNAL FADING
Signal level distributions and fade event analyses for a 5 GHz microwave link across the English Channel
[PB80-129299] N80-23557

SIGNAL PROCESSING
A rocket-borne energy spectrometer using multiple solid-state detectors for particle identification
[NASA-CR-153183] N80-23384
Signal processing using surface acoustic wave devices N80-23525
Maximum entropy spectral analysis and radar signal processing
[AD-A081343] N80-23548
New results on the innovations problem for non-linear filtering
[AD-A081574] N80-23566
A random sampler of dynamic programming applications in signal processing and control
[AD-A081485] N80-24007
Signal processing for higher frequency ultrasonic imaging N80-24125

SIGNATURE ANALYSIS
Techniques and applications of mechanical signature analysis N80-23401

SILICON
Analysis of the effects of impurities in silicon
[NASA-CR-163133] N80-23772
Density variation in the electron-hole liquid in stressed germanium and silicon
[LBL-8786] N80-24152
Model of the recrystallization mechanism of amorphous silicon layers created by ion implantation
[LBL-9890] N80-24196

SILICON CARBIDES
High-temperature mechanical properties of sintered alpha silicon carbide (13 October 1978 - 13 October 1979)
[AD-A081624] N80-23375
Program to study SiC fiber reinforced glass matrix composites
[AD-A077638] N80-23379

SILICON FILMS
The effects of hydrogen content on reactively sputtered amorphous silicon films N80-24152

SILICON NITRIDES
Fabrication and properties of a pressureless sintered silicon nitride based on Y2O3 as sintering aid
N80-23381
Sintering of silicon nitride in a powder bed
N80-23382
Formation of porous surface layers in reaction bonded silicon nitride during processing
[NASA-TM-81493] N80-23456

SILICON TRANSISTORS
Techniques for low noise and high power transistors in integrated circuits
[BMFT-FB-T-79-15] N80-23587

SILICONE RESINS
The chemistry of silicone resins, volume 1. Citations from the NTIS data base
[PB80-804302] N80-23469

SILICONES
Development of high temperature silicone base fire-resistant hydraulic fluid
[AD-A081597] N80-23459

SILVER ZINC BATTERIES
Test and evaluation of MK 37 torpedo batteries
[AD-A081642] N80-23543

SIMULATION
Suggested experiments for momentum-free G-simulation using the Long Duration Exposure Facility (LDEF)
[TUM-URT-4B-77/18] N80-23360
Interactive simulation of the progressive collapse of a building revisited
[TRITA-NA-7921] N80-23706

SINGLE CRYSTALS
Hydrogen embrittlement in vanadium single crystals
[SNL-219] N80-23441

SINTERING
High-temperature mechanical properties of sintered alpha silicon carbide (13 October 1978 - 13 October 1979)
[AD-A081624] N80-23375
Fabrication and properties of a pressureless sintered silicon nitride based on Y2O3 as sintering aid
N80-23381
Sintering of silicon nitride in a powder bed
N80-23382
Formation of porous surface layers in reaction bonded silicon nitride during processing
[NASA-TM-81493] N80-23456
Sinterable powders from laser driven reactions
[AD-A081709] N80-23460

SIZE DETERMINATION
An interactive computer program for sizing spacecraft momentum storage devices
[NASA-TM-81798] N80-24002

SKIN (STRUCTURAL MEMBER)
Peak wind loads on cladding panels and their dependence upon panel size
[OUEL-1286/79] N80-23706

SKY
Experimental investigation of an inexpensive sky temperature measuring device
[COO-4522-1] N80-23945

SKY BRIGHTNESS
Telephotometric study of baseline visual range at Cedar Mountain, Utah, 21 April to 16 May 1978
[PB80-137382] N80-23928
Telephotometric study of baseline visual range at Cedar Mountain, Utah, 19 January to 6 March 1979
[PB80-142227] N80-23931

SLENDER BODIES
Active control of asymmetric vortex effects
[AD-A081648] N80-23254

SLIDING FRICTION
An analytical means for determination of scoring limited load capacity in sliding/rolling contact
[AD-A080894] N80-23657

SLOPES
LANDSAT reconnaissance images of the great soil region in the western part of the Paraiba Basin --- Brazil
[E80-10103] N80-23730
Pointbars: A comparative examination along the large Dutch rivers --- Netherlands
[REPT-2] N80-23760

SMOKE
Air pollution in Delft. Measurements of smoke during 1977 in Delft and Naaldwijk
[IG-TNO-G-788] N80-23895

SOCIAL FACTORS
A study of the potential impacts of space utilization
[NASA-CR-163131] N80-23339
Investigating the noise pollution problem. A theoretical model
[IG-PUBL-983] N80-23885

SODIUM
Scattering of low-energy electrons by laser excited sodium atoms in the 3 2P 3/2 state N80-24137

SOIL MAPPING
LANDSAT reconnaissance images of the great soil region in the western part of the Paraiba Basin --- Brazil
[E80-10103] N80-23730
The application of remote sensing technology to the solution of problems in the management of resources in Indiana --- pheasant habitats in Benton County, soil mapping in Jasper County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23738

SOIL MECHANICS
Progressive settlements of foundations on cohesionless soils subjected to vertical vibratory loadings N80-23494
Soil mechanical tests on Pacific deep sea sediments
[BMFT-FB-M-78-02] N80-23963

SOIL MOISTURE
Hydrologic evaluation of the stormflow generation process on a forested watershed --- Pennsylvania
N80-23713
Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720
Agricultural soil moisture experiment: 1978 Colby (Kansas) data catalog and documentation --- Thomas County, Kansas
[E80-10098] N80-23725
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Agricultural scene understanding and supporting field research, volume 1
[E80-10113] N80-23740
Neutron-meter calibration for the 1978 Colby soil moisture experiment --- Thomas County, Kansas
[E80-10120] N80-23746
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

SOLAR ACTIVITY
Solar microwave bursts accompanying proton events
[AD-A081461] N80-24241

SOLAR ARRAYS
Automated array assembly, phase 2
[NASA-CR-153191] N80-23770
Development of pulsed processes for the manufacture of solar cells
[NASA-CR-153188] N80-23771
Development and fabrication of a solar cell junction processing system
[NASA-CR-153194] N80-23773
Design, construction and testing of a 60 kW solar array and power conversion system
[AD-A080877] N80-23782
Design of low-cost structures for photovoltaic arrays. Volume 2: Technical studies and appendices
[SAND-79-7002-VOL-2] N80-23837
Low cost structures for photovoltaic arrays
[SAND-80-0142C] N80-23853

SOLAR ATMOSPHERE
Internal gravity waves in the solar atmosphere
N80-24238

SOLAR CELLS
Amphoteric gallium arsenide heteroface solar cells
N80-23765
Solar cell heterojunctions involving N-cadium sulfide and certain P-type semiconductor single crystals
N80-23766
Properties of sputtered ITO/CdTe solar cells
N80-23767
Analysis of the effects of impurities in silicon
[NASA-CR-163133] N80-23772
Photovoltaic mechanisms in polycrystalline thine-film solar cells
[DSE/3412-T1] N80-23834

SOLAR COLLECTORS
Development of a solar thermal receiver for high temperature applications
[SERI/TP-333-485] N80-23800
Metal foils for direct application of absorber coatings on solar collectors
[LBL-9324-REV] N80-23810

Low-cost mirror concentrator based on double-walled metallized, turbular films
[ALO-4227-12] N80-23811
Study and analysis of a low cost cement bonded flat plate solar collector
[ALO-4122-T1] N80-23816
Solar energy systems: Test methods for collector insulations
[PB80-132038] N80-23867
Solar collector fluid parameter study
[PB80-125891] N80-23869

SOLAR CORONA
The effect of transport phenomena on electron velocity distribution functions and ion abundances in the solar chromosphere-corona transition region
N80-24239

SOLAR COSMIC RAYS
The collective acceleration mechanism of solar cosmic rays --- nuclei trapped by electron bunching
[IFVE-OTF-78-112] N80-24246

SOLAR ENERGY
Direct solar pumped laser
[LA-7982-MS] N80-23651
Application and design studies of compressed-air energy storage for solar applications
[CAES-7] N80-23788
Technical information dissemination plan for the US Department of Energy, ETS/Solar Divisions
[SERI/SP-69-071] N80-24205

SOLAR ENERGY ABSORBERS
Non-Concentrating collectors for solar heating applications (medium temperature air heaters based on durable transparent films)
[ALO-4147-T1] N80-23817

SOLAR ENERGY CONVERSION
Fluid circulating pump operated by same incident solar energy which heats energy collection fluid
N80-23500
Direct solar pumped laser
[LA-7982-MS] N80-23651
Solar hot water system installed at Quality Inn, Key West, Florida
[NASA-CR-161434] N80-23774
Redox storage systems for solar applications
[NASA-TM-81464] N80-23777
Design, construction and testing of a 60 kW solar array and power conversion system
[AD-A080877] N80-23782
Environmental assessment methodology: Solar power plant applications. Volume 2: Industrial implications and secondary-impact methodology
[EPRI-ER-1070-VOL-2] N80-23786
Solar applications of thermal energy storge
[TID-29430] N80-23791
NOAA's role in the solar energy program
[DOE/ET-0110] N80-23792
Solar energy program evaluation: An introduction
[SERI/TR-51-294] N80-23798
Conversion system overview assessment. Volume 2: Solar-wind hybrid systems
[SERI/TR-35-078-VOL-2] N80-23799
Residential passive solar systems: Regional sensitivity to system performance costs, and alternative prices
[LA-UR-79-3390] N80-23807
Solar production of industrial process steam ranging in temperature from 300 deg F to 550 deg F, phase 1. Volume 3: Appendices (cont)
[DOE/CS-32199-3] N80-23812
Solar production of industrial process steam ranging in temperature from 300 degrees F to 550 degrees F, phase 1. Volume 2: Appendices
[DOE/CS-32199-2] N80-23813
Solar thermal repowering utility value analysis
[SERI/TR-8016-1] N80-23814
Data handbook for the National Solar Energy demonstration program
[DSE/5216-T3] N80-23815
Preliminary definition and characterizations of solar industrial process heat technology and manufacturing plant for the year 2000
[LA-UR-79-2812] N80-23820
Status of insolation resource assessment in the Northeast
[NESEC-6] N80-23826
Environmental data for sites in the National Solar Data Network
[SOLAR/0010-79/05] N80-23833
Passive solar calculation methods
[DSE/5221-T1] N80-23836
Series solar heat pump and energy conservation
[BNL-27012] N80-23857
Developing and upgrading of solar system thermal energy storage simulation models
[BCS-40252] N80-23858
Solar energy systems: Standards for rubber hose
[PB80-129828] N80-23868

SOLAR FLARES
The collective acceleration mechanism of solar cosmic rays --- nuclei trapped by electron bunching
[IFVE-OTF-78-112] N80-24246

SOLAR FLUX DENSITY
Solar photo rate coefficients --- monatomic gases and metastable states
[LA-8085-MS] N80-24243
History of the Sun's luminosity, 0 to 460,000 BP, based on the geologic record in light of recent climate theory
[UCRL-80972-REV-2] N80-24244

SOLAR GENERATORS
Design, construction and testing of a 60 kW solar array and power conversion system
[AD-A080877] N80-23782
Heliostat design cost/performance tradeoffs
[SAND-79-8248] N80-23806

SOLAR GRAVITATION
Internal gravity waves in the solar atmosphere
N80-24238

SOLAR HEATING
Solar heating system installed at Blakedale Professional Center, Greenwood, South Carolina
[NASA-CR-161435] N80-23776
Non-Concentrating collectors for solar heating applications (medium temperature air heaters based on durable transparent films)
[ALO-4147-T1] N80-23817
Off-peak electric auxiliary heat for solar air-heating systems
[COO-4516-1] N80-23827
Performance improvement of a solar heating system utilizing off-peak electric auxiliary
[DOE/R5/10140-1] N80-23852

SOLAR MAXIMUM MISSION
A polarimeter for the high resolution ultraviolet spectrometer/polarimeter --- Solar Maximum Mission
N80-23520

SOLAR PONDS (HEAT STORAGE)
Application of shallow solar ponds for industrial process heat: Case histories
[UCRL-82367] N80-23822
SOLPOND: A simulation program for salinity gradient solar ponds
[SERI/TP-351-559] N80-23856

SOLAR POSITION
Nationwide forestry applications program: Corrections to forest reflectance as a function of low Sun angle and slope --- Washington County, Missouri
[E80-10100] N80-23727

SOLAR POWER SATELLITES
Electrostatic protection of the Solar Power Satellite and rectenna
[NASA-CR-161438] N80-23348

SOLAR RADIATION
Chemical physics of charge mechanisms in nonmetallic spacecraft materials
[AD-A081487] N80-23363
NOAA's role in the solar energy program
[DOE/ET-0110] N80-23792
Status of insolation resource assessment in the Northeast
[NESEC-6] N80-23826

SOLAR RADIO BURSTS
LASL gamma-ray burst astronomy program
[LA-UR-80-80] N80-24224
Solar microwave bursts accompanying proton events
[AD-A081461] N80-24241

SOLAR REFLECTORS
Preliminary design report: New ideas for heliostat reflector cleaning systems
[SAND-79-8181] N80-23809
Non-inverting heliostat study
[SAND-78-8190] N80-23819
Solar reflector materials
[PNL-SA-7698] N80-23859

SOLAR TERRESTRIAL INTERACTIONS
Application of advanced computational procedures for modeling solar-wind interactions with Venus: Theory and computer code
[NASA-CR-3267] N80-24240
History of the Sun's luminosity, 0 to 460,000 BP, based on the geologic record in light of recent climate theory
[UCRL-80972-REV-2] N80-24244

SOLAR WIND
Application of advanced computational procedures for modeling solar-wind interactions with Venus: Theory and computer code
[NASA-CR-3267] N80-24240
The latitudinal structure of solar wind streams from radio scintillation observations
[AD-A081462] N80-24242

SOLAR WIND VELOCITY
The latitudinal structure of solar wind streams from radio scintillation observations
[AD-A081462] N80-24242

SOLAR X-RAYS
The solar impulsive hard X-ray spectrum
N80-24245

SOLID PROPELLANT ROCKET ENGINES
Surveillance Report. Stage 1, dissected motors, phase 11: Propellant component testing
[AD-A081535] N80-23366
Development of a microprocessor-based instrument for static testing small rocket engines
[AD-A081083] N80-23367

SOLID PROPELLANTS
A primitive variable computer model for combustion within solid fuel ramjets
[AD-A081081] N80-23319

SOLID ROCKET PROPELLANTS
Surveillance Report. Stage 1, dissected motors, phase 11: Propellant component testing
[AD-A081535] N80-23366
Process for the leaching of AP from propellant
[NASA-CASE-NPO-14109-1] N80-23471
Propellant surveillance report LGM-30 A and B stage 1, TP-H1011
[AD-A081493] N80-23475

SOLID STATE
Fatigue crack propagation in a directionally solidified cobalt-base eutectic N80-23426
Crystallography in fusion-weld-metal solidification mechanics N80-23429

SOLID STATE DEVICES
A rocket-borne energy spectrometer using multiple solid-state detectors for particle identification
[NASA-CR-153183] N80-23364

SOLID WASTES
Naval facility energy conversion plants as resource recovery system components
[AD-A081232] N80-23783
SWARU: Solid waste disposal resource system
[NP-24196] N80-24146

SOLIDIFICATION
Program to investigate advanced laser processing of materials
[AD-A077573] N80-23646

SOLIDS
Studies in the small motions of viscoelastic solids
N80-23673

SOLVENTS
Solvent effects on photophysical parameters for coumarin laser dyes
[AD-A081749] N80-23641

SORPTION
Gravimetric determination of gas sorption by means of an electronic micro-balance
[PNR-90009] N80-23407

SOUND PROPAGATION
On the organized large-scale structure in a turbulent round jet and its far-field sound N80-23593
Hyperbolic fits to time-of-arrival sound ranging measurements
[AD-A080746] N80-24130

SOUND RANGING
Hyperbolic fits to time-of-arrival sound ranging measurements
[AD-A080746] N80-24130

SOUND TRANSDUCERS
Pulse transducer with artifact signal attenuator --- heart rate sensors
[NASA-CASE-FRC-11012-1] N80-23969

SOUND TRANSMISSION
The interaction of sound with noise in water
N80-24128

SOUND WAVES
A general theory for the scattering of sound by sound with parametric array applications N80-24126

Recent development for the nonlinear distortion of non-dispersive acoustic waves. Part 2: Multidimensional systems N80-24248

SOUND-SOUND INTERACTIONS

A general theory for the scattering of sound by sound with parametric array applications N80-24126

SOUTH CAROLINA

Solar heating system installed at Blakedale Professional Center, Greenwood, South Carolina
[NASA-CR-161435] N80-23776

SOUTH DAKOTA

Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726

LANDSAT'S role in HUD 701 programs --- New Jersey and South Dakota
[E80-10102] N80-23729

Processing techniques development, volume 2. Part 1: Crop inventory techniques --- Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741

Composition and assembly of a spectral data base for transition year spring wheat blind sites --- North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747

SOYBEANS

Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10093] N80-23720

Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726

Evaluation of several schemes for classification of remotely sensed data: Their parameters and performance --- Foster County, North Dakota; Grant County, Kansas; Iroquois County, Illinois, Tippecanoe County, Indiana; and Pottawattamie and Shelby Counties, Iowa
[E80-10105] N80-23732

Applicability of selected wheat remote sensing technology to corn and soybeans
[E80-10112] N80-23739

Agricultural scene understanding and supporting field research, volume 1
[E80-10113] N80-23740

Processing techniques development, volume 2. Part 1: Crop inventory techniques --- Iowa, Illinois, Indiana, Kentucky, Montana, and South Kakota
[E80-10114] N80-23741

Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744

Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

SPACE ERECTABLE STRUCTURES

A mechanical adapter for installing mission equipment on large space structures N80-23515

SPACE EXPLORATION

Mars
[TUM-LRT-KB-13/77] N80-24237

SPACE HEATING (BUILDINGS)

Solar heating system installed at Blakedale Professional Center, Greenwood, South Carolina
[NASA-CR-161435] N80-23776

Use of adaptive optimal control to provide energy conservation in large buildings
[LA-UR-79-3354] N80-23804

Residential passive solar systems: Regional sensitivity to system performance costs, and alternative prices
[LA-UR-79-3390] N80-23807

SPACE LABORATORIES

Automatic Space Processing Equipment (ASPE), pre-phase A study. Volume 1: Technical summary
[PRV-3-6/79-VOL-1] N80-23343

Automatic Space Processing Equipment (ASPE), pre-phase A study. Volume 2: Technical appendix
[PRV-3-6/79-VOL-2] N80-23344

Earth orbital experiment program and requirements study
[NASA-CR-162132] N80-23346

SPACE MANUFACTURING

Automatic Space Processing Equipment (ASPE), pre-phase A study. Volume 1: Technical summary
[PRV-3-6/79-VOL-1] N80-23343

Automatic Space Processing Equipment (ASPE), pre-phase A study. Volume 2: Technical appendix
[PRV-3-6/79-VOL-2] N80-23344

Automated beam builder N80-23516

SPACE MISSIONS

Earth orbital experiment program and requirements study
[NASA-CR-162132] N80-23346

The study of real-time software on space missions, volume 1
[REPT-7T40423/MEG/JCR-VOL-1] N80-24027

The study of reliability of real-time software for space missions, volume 2
[ESA-CR(P)-1270-VOL-2] N80-24028

The study of reliability of real-time software for space missions, volume 3
[REPT-7T40423/MEG/JCR-VOL-3] N80-24029

SPACE PROCESSING

Automatic Space Processing Equipment (ASPE), pre-phase A study. Volume 1: Technical summary
[PRV-3-6/79-VOL-1] N80-23343

Automatic Space Processing Equipment (ASPE), pre-phase A study. Volume 2: Technical appendix
[PRV-3-6/79-VOL-2] N80-23344

Analysis of possible improvements of alloys due to directional eutectic solidification in zero gravity conditions
[ESA-TT-575] N80-23447

Crystal growth of device quality GaAs in space
[NASA-CR-153190] N80-24185

SPACE PROGRAMS

A study of the potential impacts of space utilization
[NASA-CR-163131] N80-23339

Earth orbital experiment program and requirements study
[NASA-CR-162132] N80-23346

SPACE SHUTTLE ORBITERS

Shuttle program standard maneuver sequences for orbiter/upper-stage separation SSUS-A, SSUS-D, and IUS
[NASA-TM-81058] N80-23341

Orbiter door closure tools N80-23498

Orbiter emergency crew escape system N80-23499

SPACE SHUTTLE PAYLOADS

Long Duration Exposure Facility (LDEF): A new multipurpose free-flying experiment carrier
[TUM-LRT-KB-77/17] N80-23359

Drawer drive for space shuttle vacuum canister --- long duration exposure facility N80-23518

Cryogenic cooling study for the advanced limb scanner
[NASA-CR-159250] N80-23621

SPACE SHUTTLE UPPER STAGES

Shuttle program standard maneuver sequences for orbiter/upper-stage separation SSUS-A, SSUS-D, and IUS
[NASA-TM-81058] N80-23341

Mechanisms to deploy the two-stage IUS from the shuttle cargo bay N80-23496

SPACE SHUTTLES

Adjustable high emittance gap filler --- reentry shielding for space shuttle vehicles
[NASA-CASE-ARC-11310-1] N80-23454

Room temperature mechanical properties of shuttle thermal protection system materials
[NASA-TM-81786] N80-23682

SPACE TRANSPORTATION SYSTEM

A study of the potential impacts of space utilization
[NASA-CR-163131] N80-23339

Shuttle program standard maneuver sequences for orbiter/upper-stage separation SSUS-A, SSUS-D, and IUS
[NASA-TM-81058] N80-23341

Space transportation system western launch site construction management information system: A case study
[AD-A077675] N80-23358

Proceedings of the 14th Aerospace Mechanisms Symposium
[NASA-CP-2127] N80-23495

Mechanisms to deploy the two-stage IUS from the shuttle cargo bay N80-23496

Room temperature mechanical properties of shuttle thermal protection system materials
[NASA-TM-81786] N80-23682

EVA manipulation and assembly of space structure columns
[NASA-CR-3285] N80-23968

SPACE-TIME FUNCTIONS

On vacuum fluctuations of a scalar field in a localized region of spacetime N80-24199

SPACEBORNE EXPERIMENTS

Suggested experiments for momentum-free G-simulation using the Long Duration Exposure Facility (LDEF)
[TUM-LRT-KB-77/18] N80-23360

SPACECRAFT CHARGING

Electrostatic protection of the Solar Power Satellite and rectenna
[NASA-CR-161438] N80-23348

Chemical physics of charge mechanisms in nonmetallic spacecraft materials
[AD-A081487] N80-23363

SPACECRAFT COMMUNICATION

A study of spectrum efficient modulation techniques for digital satellite communications
[Y/212/5086] N80-23556

SPACECRAFT CONFIGURATIONS

Measured and predicted shock shapes and aerodynamic coefficients for blunted cones at incidence in air at Mach 5.9
[NASA-TP-1652] N80-23600

SPACECRAFT DESIGN

On the advanced power system configuration study
[TP-7753] N80-23355

Long Duration Exposure Facility (LDEF): A new multipurpose free-flying experiment carrier
[TUM-LRT-KB-77/17] N80-23359

An interactive computer program for sizing spacecraft momentum storage devices
[NASA-TM-81798] N80-24002

SPACECRAFT INSTRUMENTS

A precision bearing gimbal system for the Teal Ruby program N80-23508

Gyro noise measurement and analysis
[NLR-TR-79077-U] N80-23635

SPACECRAFT LAUNCHING

Prelaunch summary: NOAA-B launch
[NASA-TM-81060] N80-23340

SPACECRAFT RADIATORS

Spacecraft radiators for advanced mission requirements
[NASA-CR-160589] N80-23362

SPACECRAFT RELIABILITY

A study of increased reliability and lifetimes for future communications satellites, volume 1
[GTS-790174-VOL-1] N80-23356

A study of increased reliability and lifetimes for future communications satellites, volume 2
[GTS-790173-VOL-2] N80-23357

SPACECRAFT SHIELDING

Development of a special purpose spacecraft coating, phase 4
[NASA-CR-160586] N80-23455

SPACECRAFT STRUCTURES

Chemical physics of charge mechanisms in nonmetallic spacecraft materials
[AD-A081487] N80-23363

SPACECRAFT TRAJECTORIES

Functional and operational advances in the AFGL rocket trajectory system-I
[AD-A081447] N80-23349

SPACECREWS

Psychological selection of Spacelab payload specialists. The evaluation of German applicants
[ESA-TT-586] N80-23987

SPACELAB

Modeling of coupled heat transfer by radiation and convection: Application to Spacelab short module
[ESA-STM-214] N80-23361

Psychological selection of Spacelab payload specialists. The evaluation of German applicants
[ESA-TT-586] N80-23987

SPACELAB PAYLOADS

Feasibility study of a Spacelab-subsatellite
[DLR-FB-77-67] N80-23352

Long Duration Exposure Facility (LDEF): A new multipurpose free-flying experiment carrier
[TUM-LRT-KB-77/17] N80-23359

Thermal and cryotechnical definition study on minicryogenerator system for space application (SQUID magnetometer) --- Spacelab payload
[BMFT-FB-W-79-01] N80-23586
Study and detail design of the engineering model of a vapor compressor to be used in space
[F/W-FO-1488] N80-23864

SPAIN
Space research activities in Spain --- outlining Spanish space research N80-24212

SPATIAL DISTRIBUTION
Spatial variability of ozone and other pollutants at St. Louis, Missouri
[PB80-132830] N80-23930

SPECTRAL LINE WIDTH
Inhomogeneous broadening effects in CW chemical lasers
[AD-A077319] N80-23435

SPECTRAL REFLECTANCE
Automatic interpretation of LANDSAT data to characterize the dispersion of suspended sediments in artifical reservoirs --- Tres Marias Dam, Brazil
[E80-10110] N80-23737
Applicability of selected wheat remote sensing technology to corn and soybeans
[E80-10112] N80-23739

SPECTRAL SIGNATURES
Categorization of watershed land cover units with LANDSAT data --- semiarid watershed in Utah
N80-23712
Nationwide forestry applications program: Corrections to forest reflectance as a function of low Sun angle and slope --- Washington County, Missouri
[E80-10100] N80-23727
Agricultural scene understanding and supporting field research, volume 1
[E80-10113] N80-23740
Corn/soybean decision logic: Improvements and new crops --- Mississippi, Louisiana, North Dakota, and Minnesota
[E80-10118] N80-23744
Interpretation of LANDSAT digital data using a cubic color model based on relative energies
[E80-10119] N80-23745
Composition and assembly of a spectral data base for transition year spring wheat blind sites --- North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747
Remote sensing for geothermal environmental assessments --- Imperial Valley and The Geysers, California
[UCRL-15108] N80-23756
Radiometric measurements by the MIDAS 3 system at Key West. Volume 1: Cloud backgrounds
[AD-A081052] N80-23837

SPECTROMETERS
A rocket-borne energy spectrometer using multiple solid-state detectors for particle identification
[NASA-CR-153183] N80-23364
Conduct of cloud spectra measurements
[AD-A081127] N80-23914

SPECTRORADIOMETERS
Spatial radiometer, volume 1
[AD-A081584] N80-23628

SPECTROSCOPIC ANALYSIS
Improvements in detection capabilities in atomic spectroscopy N80-23391

SPECTRUM ANALYSIS
Maximum entropy spectral analysis and radar signal processing
[AD-A081343] N80-23548
Modern methods of multiple spectral density estimation
[AD-A081172] N80-24058
Spectral analysis of non-stationary random processes. Application to noise of flyover type
[ONERA-NT-1979-4] N80-24134
The solar impulsive hard X-ray spectrum
N80-24245

SPLINE FUNCTIONS
Quadrature subroutines for splines and B-splines
[SAND-79-1825] N80-24067

SPLITTING
One-step splitting methods, formulated for semi-discrete parabolic equations
[MC-NW-55/78] N80-24073

SPRAYED COATINGS
Development of improved-durability plasma sprayed ceramic coatings for gas turbine engines
[NASA-TM-81512] N80-23313

SPUTTERING
Properties of sputtered ITO/CdTe solar cells
N80-23767
The effects of hydrogen content on reactively sputtered amorphous silicon films N80-24152

SQUID (DETECTORS)
Thermal and cryotechnical definition study on minicryogenerator system for space application (SQUID magnetometer) --- Spacelab payload
[BMFT-FB-W-79-01] N80-23586

STABILITY
On the stability of multistep formulas for Volterra integral equations of the second kind
[MC-NW-59/78] N80-24076
On the stability of multistep formulas for systems of Volterra integro-differential equations
[MC-NW-63/78] N80-24078

STABILITY TESTS
An assessment of the stability and opening characteristics of cruciform parachutes
[BU-238] N80-23276
Assessment of current high-temperature strain gages
[ORNL/TM-7025] N80-23632

STACKS
An investigation into the initial mixing and dilution of identical plumes from multiple stack configurations
[BU-233] N80-23902

STAGE SEPARATION
Shuttle program standard maneuver sequences for orbiter/upper-stage seperation SSUS-A, SSUS-D, and IUS
[NASA-TM-61058] N80-23341

STAINLESS STEELS
Chemical decontamination of metals --- treatment with a cerium-nitric acid solution
[HEDL-SA-1860] N80-23442

STAMPING
The indentation of an elastic layer by a rigid stamp under conditions of complete adhesion
[MC-TW-181/78] N80-23703

STANDARD DEVIATION
Bounds for the mean and standard deviation of linear combinations of order statistics
[MC-SW-58/78] N80-24111

STANDARDIZATION
Identification system for apparatus and plant used in thermal power stations
[PNR-90008] N80-23863

STANDARDS
Opportunities analysis of potential advanced vortex systems separation standards
[AD-A081479] N80-23281
Analysis of some laser light show effects for classification purposes
[PB80-131578] N80-23652
Decision path approach to guidance for climatic environmental test planning (MIL-STD-810C)
[AD-A080909] N80-23886

STAR DISTRIBUTION
Model of a starfield identifier
[BMFT-FB-W-79-05] N80-24161

STARS
Theoretical investigation of stationary stellar systems in the Brans-Dicke theory of gravitation, with applications to perfect fluid interiors --- by modifying theory of relativity N80-24225

STATIC STABILITY
An analysis of the static and dynamic instability of thick cylinders
[OUEL-1292/79] N80-23709

STATIC TESTS
Development of a microprocessor-based instrument for static testing small rocket engines
[AD-A081083] N80-23367

STATISTICAL ANALYSIS
Environmental assessment methodology: Solar power plant applications. Volume 2: Industrial implications and secondary-impact methodology
[EPRI-ER-1070-VOL-2] N80-23786
Rate statistics for radio noise from lightning
[NASA-TP-1865] N80-23933
Some statistical techniques for climatological data
[AD-A081490] N80-23942
Some statistics on ALGOL 68 programs
[MC-IW-109/79] N80-24032
Time series analysis methods and applications: increased interdisciplinary interaction could stimulate research breakthroughs
[AD-A081174] N80-24080
The method of n rankings when the underlying distributions are discrete
[CSIR-TWISK-108] N80-24100
On the performance of least squares estimators in type two censored accelerated life tests
[AD-A080812] N80-24103
Testing with replacement and the product limit estimator
[MC-SW-57/78] N80-24110
Bounds for the mean and standard deviation of linear combinations of order statistics
[MC-SW-58/78] N80-24111
A computer simulation of organizational decision-making
[AD-A081600] N80-24202
Fuel consumption measurements-carbon balance versus flow meter
[PB80-128549] N80-24218

STATISTICAL DECISION THEORY
Bayesian concepts for reliability and statistical decision theory for structural design N80-23493

STATISTICAL DISTRIBUTIONS
A note on the median of the binomial distribution
[MC-SW-59/78] N80-24081
Stochastic filtering theory: A discussion of concepts, methods, and results
[MC-BW-96/78] N80-24109

STATISTICAL MECHANICS
Large deviations of multivariate-L-estimators with monotone weight functions
[MC-SW-63/78] N80-24112

STATISTICAL TESTS
The efficiency of three tests for linear hypotheses concerning two probabilities
[MC-SW-62/78] N80-24084

STATISTICAL WEATHER FORECASTING
Comparison and verification of dynamical and statistical Lake Erie storm surge forecasts
[PB80-137797] N80-23954

STEADY STATE
Study of the general plasma characteristics of a high power multifilament ion source
[LBL-8940] N80-24178

STEELS
Hydrogen attack of steel
[COO-2872-04] N80-23439
Non-destructive evaluation of defects in structural materials using long-wavelength neutrons
[AD-A081097] N80-23665

STELLAR EVOLUTION
Evolution of a supermassive object accreting mass
N80-24226

STELLAR GRAVITATION
Studies on gravitational waves and stars with neutron cores N80-24229

STELLAR LUMINOSITY
Model of a starfield identifier
[BMFT-FB-W-79-05] N80-24161
Observations and analysis of four eclipsing binary systems N80-24219
Pulsation of high luminosity helium stars
[LA-UR-79-2785] N80-24223

STELLAR MASS
Evolution of a supermassive object accreting mass
N80-24226

STELLAR MASS EJECTION
The shell episode of 59 Cygni (1974-1975): Rotating magnetic winds? N80-24221

STELLAR MODELS
Theoretical investigation of stationary stellar systems in the Brans-Dicke theory of gravitation, with applications to perfect fluid interiors --- by modifying theory of relativity N80-24225

STELLAR RADIATION
Rapid oscillations in cataclysmic variables
N80-24228

STELLAR WINDS
The shell episode of 59 Cygni (1974-1975): Rotating magnetic winds? N80-24221

STERILIZATION
Effect of hydrogen chloride on the morphology of Bacillus subtilis spores N80-23967
Sterilization by means of hydrogen chloride: Influence of process parameters on the biocidal activity N80-23968

STOCHASTIC PROCESSES
Design of stochastic discrete-time linear optimal regulator
[OUEL-1298/79] N80-23589

Sampling representations and approximations for certain functions and stochastic processes
[AD-A081533] N80-24102
Stochastic filtering theory: A discussion of concepts, methods, and results
[MC-BW-96/78] N80-24109
Testing with replacement and the product limit estimator
[MC-SW-57/78] N80-24110

STORAGE BATTERIES
Grids for maintenance-free storage batteries made from lead-akaline earth metal-alloys
[BMFT-FB-T-79-21] N80-23864

STORAGE RINGS (PARTICLE ACCELERATORS)
Electromagnetic interaction of colliding beams on storage rings
[BNL-27035] N80-23549
Intense ion beam applications to magnetic confinement fusion
[COO-4460-2] N80-24176

STORMS (METEOROLOGY)
Project severe environmental storms and mesoscale experiment
[PB80-119902] N80-23950
Comparison and verification of dynamical and statistical Lake Erie storm surge forecasts
[PB80-137797] N80-23954

STRAIN GAGES
Assessment of current high-temperature strain gages
[ORNL/TM-7025] N80-23632

STRAIN HARDENING
Superposition of alloy hardening, strain hardening, and dynamic recovery
[CONF-790801-6] N80-23436
Implicit strain-hardening formulation for creep analysis
[K/CSD/TM-30] N80-23702

STRAIN RATE
Elastic-plastic deformation at finite strain
N80-23672

STRATUS CLOUDS
Diurnal variations of coastal stratus
[AD-A080951] N80-23939
Deformation of the marine inversion and the development of marine fog and stratus resulting from warm water patches, numerical modeling and verification with satellite imagery
[AD-A081089] N80-23940

STREAK CAMERAS
Streakcamera aperture function
[UCID-18520] N80-23633

STREAK PHOTOGRAPHY
Streakcamera aperture function
[UCID-18520] N80-23633

STREAMS
Hydrologic evaluation of the stormflow generation process on a forested watershed --- Pennsylvania
N80-23713

STRESS (PHYSIOLOGY)
Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748
Time for recovery from successive bouts of exercise as measured by changes in the anaerobic threshold: A comparison of recovery intervals of 24 and 48 hours N80-23970
Influence of experimental hypokinesia on gastric secretory function
[NASA-TM-76034] N80-23974
Procedure of practical exercise with students on the pathogenic effect of accelerations on the organism
[NASA-TM-76120] N80-23976

STRESS ANALYSIS
Dynamics of a moving mass being abruptly stopped by a cable
[AD-A081158] N80-23687
Computer analysis of shells and composites
[AD-A081469] N80-23690
Analytical stress analysis of elastic composites with cracks
[UCRL-15109] N80-23696
Thermal stress analysis and the effect of temperature dependence of material properties on Doublet 3 limiter design --- reactor materials
[GA-A-15626] N80-23700
Implicit strain-hardening formulation for creep analysis
[K/CSD/TM-30] N80-23702
Density variation in the electron-hole liquid in stressed germanium and silicon
[LBL-8786] N80-24192

STRESS CONCENTRATION
An investigation of residual stresses in simulated wing panels of 7075-T6 aluminum
[AD-A080863] N80-23693
Application of laser ranging and VLBI data to a study of plate tectonic driving forces --- finite element method N80-23910

STRESS CORROSION
Aircraft carrier exposure tests of aluminum alloys
[AD-A081060] N80-23433
Materials evaluation. Part 2: Development of corrosion inhibitors
[AD-A080905] N80-23434

STRESS CORROSION CRACKING
Stress corrosion characteristics of Al-Zn-Mg alloys with copper additions N80-23421

STRESS RATIO
Practical implementation of the double linear damage rule and damage curve approach for treating cumulative fatigue damage
[NASA-TM-81517] N80-23684

STRESS WAVES
Interaction of large amplitude stress waves in layered elastic-plastic materials
[AD-A081429] N80-23691

STRESS-STRAIN RELATIONSHIPS
Stress-birefringence-strain relations in polymer networks with specially designed structures
N80-23451
Applications of generalized derivatives to viscoelasticity
[AD-A081131] N80-23686

STRUCTURAL ANALYSIS
An aeroelastic analysis of the Sheriff wing
[BU-234] N80-23274
Improved packaging for the LN-31 inertial measurement unit (F-15 aircraft)
[AD-A081745] N80-23293
Decision analysis of Advanced Scout Helicopter candidates
[AD-A081483] N80-23298
Aerodynamic computer code for computing pressure loads on a missile at high supersonic speeds and generalized altitudes
[AD-A081596] N80-23351
A review of substructure analysis of vibrating systems N80-23670
User's manual to the ACTION computer code
[NASA-CR-144973] N80-23680
State-of-the-art report on numerical integration methods for analysis of stiff structural analysis systems N80-23681
Optimum optical structures for active control --- structural analysis of a mirror system using NASTRAN
[AD-A080934] N80-24157
Structural analysis of the magnet system for Mirror Fusion Test Facility (MFTF), addendum 1 --- using NASTRAN
[UCRL-15112] N80-24179
The Shock and Vibration Digest, volume 11, no.8
[AD-A073239] N80-24247

STRUCTURAL DESIGN
Turbopropulsion combustion technology assessment
[AD-A080748] N80-23323
Stress-birefringence-strain relations in polymer networks with specially designed structures
N80-23451
Design of an atmospheric sounding radiometer for the GOES meteorological satellite system
N80-23519
A polarimeter for the high resolution ultraviolet spectrometer/polarimeter --- Solar Maximum Mission
N80-23520
The design and application of an antenna positioner mechanism for Intelsat-5 series communication satellite N80-23521
Mechanical design for a large fusion laser system
[UCRL-82928] N80-23648
Non-inverting heliostat study
[SAND-78-8190] N80-23819
Design of low-cost structures for photovoltaic arrays. Volume 2: Technical studies and appendices
[SAND-79-7002-VOL-2] N80-23837
Low cost structures for photovoltaic arrays
[SAND-80-0142C] N80-23853
A survey of structural optimization under dynamic constraints N80-24256

STRUCTURAL DESIGN CRITERIA
Lighter and stronger
[AD-A081317] N80-23694
Thermal stress analysis and the effect of temperature dependence of material properties on Doublet 3 limiter design --- reactor materials
[GA-A-15626] N80-23700

STRUCTURAL ENGINEERING
Bayesian concepts for reliability and statistical decision theory for structural design N80-23493
Lighter and stronger
[AD-A081317] N80-23694
Retrospective study of selected DOD materials and structures research and development programs. Phase 1: Case history data collection
[AD-A080547] N80-24258

STRUCTURAL MEMBERS
Critical damping in linear discrete dynamic systems
[AD-A081085] N80-23688
Fatigue in welded metal structures: An introductory report to a research program
[LPC-85] N80-23704

STRUCTURAL PROPERTIES (GEOLOGY)
Comparison of structural behavior of superplastically formed/diffusion-bonded sandwich structures and honeycomb core sandwich structures
[NASA-TM-81348] N80-23685
Study of geological structure of Sicily and other Italian areas --- Gulf of Orosei, East Sardinia
[E80-10108] N80-23735
Integrated surveys of the natural resources in the Amazonia National Park (Topajos) based on LANDSAT images --- Brazil
[E80-10109] N80-23736
Volcanic features of Hawaii. A basis for comparison with Mars
[NASA-SP-403] N80-23912

STRUCTURAL STABILITY
Elastic constants for superplastically formed/diffusion-bonded corrugated sandwich core
[NASA-TP-1562] N80-23677

STRUCTURAL STRAIN
Fatigue at high temperatures: Examination of the behavior of gasturbine casting materials also in simultaneous temperature and strain cycles
[BMFT-FB-T-79-26] N80-23444

SUBMILLIMETER WAVES
Microwave investigations of matter --- bibliographies
[AD-A081708] N80-24141

SUBROUTINES
The VIBRA-8 subsonic aerodynamic nuclear gust vulnerability code
[AD-A081722] N80-23256
A comparison of four FORTRAN routines for dense linear programs
[NPL-NACS-19/79] N80-24030
Quadrature subroutines for splines and B-splines
[SAND-79-1825] N80-24067

SUBSONIC AIRCRAFT
Wind tunnel investigation of an all flush orifice air data system for a large subsonic aircraft --- conducted in a Langley 8 foot transonic pressure tunnel
[NASA-TP-1642] N80-23304

SUBSONIC FLOW
Investigation of three-dimensional subsonic flow in straight cascades by means of potential flow calculations and experiments
[DFVLR-FB-79-09] N80-23264
The harmonically oscillating body in subsonic flow: Effect of compressibility
[ESA-TT-584] N80-23270

SUBSONIC WIND TUNNELS
Unsteady aerodynamic forces on a subsonic rectilinear cascade of blades
[PNR-90007] N80-23266

SUBSTRATES
Improvement in GaAs device yield and performance through substrate defect gettering
[AD-A081344] N80-24189

SUBSTRUCTURES
A review of substructure analysis of vibrating systems N80-23670

SUGAR CANE
Production of sugarcane and tropical grasses as a renewable energy source
[ORO-5912-T1] N80-23840

SULFATES
Development of a regional transport/transformation/removal model for SO2 and sulfate in the eastern United States N80-23871
The chemical transformation of sulfur dioxide to sulfate in the plume of the coal-burning Keystone power plant N80-23873
Analysis of high sulfate concentrations in greater New York City air
[PB80-128515] N80-23906

SULFONATES
The use of indigodisodiumdisulfonate to combat molds in ozone reagents
[IG-TNO-G-861] N80-23408

SULFUR
Gas and aerosol fluxes --- emphasizing sulfur, nitrogen, and carbon N80-23959

SULFUR DIOXIDES
Development of a regional transport/transformation/removal model for SO2 and sulfate in the eastern United States N80-23871
The chemical transformation of sulfur dioxide to sulfate in the plume of the coal-burning Keystone power plant N80-23873
SO2 measurements in Rotterdam: Volumetric SO2 determinations, April 1977 to March 1978
[IG-TNO-G-794] N80-23898

SULFURIC ACID
Potential heat exchange fluids for use in sulfuric acid vaporizers
[NASA-CASE-NPO-15015-1] N80-23394

SUPERCONDUCTORS
The effect of a saturated shield design on the design, weight, and performance of superconductive acyclic machinery
[AD-A080919] N80-23573
Vortices in superconducting films
[ISM-258] N80-24195

SUPERCRITICAL WINGS
Summary of data required for the AGARD SMP activity standard aeroelastic configurations two-dimensional configurations
[NLR-MP-79015-U] N80-23273

SUPERGIANT STARS
Evolution of a supermassive object accreting mass N80-24226

SUPERHIGH FREQUENCIES
Ku band deployed assembly and gimbal N80-23510
Dual band combiner for horn antenna
[NASA-CASE-NPO-14519-1] N80-23524

SUPERPLASTICITY
Elastic constants for superplastically formed/diffusion-bonded corrugated sandwich core
[NASA-TP-1562] N80-23677
Comparison of structural behavior of superplastically formed/diffusion-bonded sandwich structures and honeycomb core sandwich structures
[NASA-TM-81348] N80-23685

SUPERSONIC FLOW
Oscillations of the supersonic flow at an area of abrupt increase in duct cross-section
[MPIS-23/1978] N80-23263
Flutter stabilities in an annular cascade with supersonic relative flow
[ESA-TT-610] N80-23271
Experiments with rotational symmetric supersonic free jets with laser-induced J2 fluorescence
[MPIS-7/1979] N80-23616

SUPERSONIC FLUTTER
Flutter stabilities in an annular cascade with supersonic relative flow
[ESA-TT-610] N80-23271

SUPERSONIC JET FLOW
An investigation of loads on wedges placed in supersonic jets
[BU-235] N80-23275

SUPERSONIC SPEEDS
Aerodynamic computer code for computing pressure loads on a missile at high supersonic speeds and generalized altitudes
[AD-A081595] N80-23351

SUPERSONIC TRANSPORTS
Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance
[NASA-TM-81818] N80-23683

SUPPORTS
Design of low-cost structures for photovoltaic arrays. Volume 2: Technical studies and appendices
[SAND-79-7002-VOL-2] N80-23837
Low cost structures for photovoltaic arrays
[SAND-80-0142C] N80-23853

SURFACE ACOUSTIC WAVE DEVICES
Signal processing using surface acoustic wave devices N80-23525

SURFACE DEFECTS
Elimination of defects in plasma polymerized films used in laser fusion targets
[UCID-18324] N80-24165

SURFACE LAYERS
Formation of porous surface layers in reaction bonded silicon nitride during processing
[NASA-TM-81493] N80-23456
Electronic structure of semiconducting surface inversion layers --- energies of subbands N80-24183

SURFACE PROPERTIES
Practical applications of surface analytic tools in tribology
[NASA-TM-81484] N80-23430
Interface properties and surface leakage of HcCdTe photodiodes
[AD-A081530] N80-23568
Noncontact, laser interferometer sweep gage
[Y-2190] N80-23631
Studies in the theory of solids
[COO-1198-1283] N80-24194

SURFACE REACTIONS
Characterization of passive films using infrared and Raman spectroscopy
[AD-A081240] N80-23397
A surface analysis study of carbon monoxide and hydrogen absorption and desorption of Ni(3) crystals --- catalytic reactivity N80-23425
Surface contamination of adhesive bonding materials
[AD-A081316] N80-23461
Induced evaporation of metal from an aluminum surface by a normal pulse neodymium laser
[AD-A081601] N80-23638

SURFACE TEMPERATURE
Agricultural soil moisture experiment: 1978 Colby (Kansas) data catalog and documentation --- Thomas County, Kansas
[E80-10098] N80-23725
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Agricultural scene understanding and supporting field research, volume 1
[E80-10113] N80-23740

SURFACE WATER
Hydrologic evaluation of the stormflow generation process on a forested watershed --- Pennsylvania N80-23713
Automatic interpretation of LANDSAT data to characterize the dispersion of suspended sediments in artifical reservoirs --- Tres Marias Dam, Brazil
[E80-10110] N80-23737

SURFACE WAVES
Photolithographic techniques for surface acoustic wave saw devices. Volume 4: Technical and operational parts 4 and 5
[AD-A081128] N80-23571

SURVEILLANCE
Passive infrared surveillance. Part 2: Threshold-crossing receivers
[AD-A081723] N80-24159

SWITCHING CIRCUITS
Aegis spy-1 radar 5-v/60-a switching-mode power supply stability analysis: A stability analysis employing state-space averaging techniques for converter modeling
[AD-A080449] N80-23532

SYNCHRONISM
A comparison of intercontinental clock synchronization by VLBI and the NTS satellite
[NASA-TM-81063] N80-24124

SYNTHESIS
Research on diamantane and other high density
[AD-A080749] N80-23474

SYNTHETIC APERTURE RADAR
Study and development of a computer program for analysis of SAR planar array antennas
[S-110-02] N80-23555

SYNTHETIC FUELS
Research on diamantane and other high density
[AD-A080749] N80-23474
Methanol and methyl fuel catalysts --- CuO/ZnO catalysts
[FE-3177-3] N80-23482

SYSTEMS ANALYSIS
Easy-ACIS dynamic analysis. User's manual
[AD-A081160] N80-23258
Parametric performance evaluation and technical assessment of adiabatic compressed air energy storage systems
[EPRI-EM-1188] N80-23796
System optimization by periodic control
[AD-A080295] N80-24034
Matrix management for aerospace 2000
[NASA-TM-81509] N80-24200
Fuel cell systems for vehicular applications
[LA-UR-79-2826] N80-24214

SYSTEMS ENGINEERING
Visually Coupled System: Computer Generated Imagery (VCS-CGI) engineering interface
[AD-A080931] N80-23306
Practical optimal flight control system design for helicopter aircraft. Volume 1: Technical Report
[NASA-CR-3275] N80-23328
Design, development and implementation of an active control system for load alleviation for a commercial transport airplane
[AGARD-AR-683] N80-23331
Spacecraft radiators for advanced mission requirements
[NASA-CR-160589] N80-23362
Microwave spectrometer for the detection of transient gaseous species
[LBL-7293] N80-23403
Thermal and cryotechnical definition study on minicryogenerator system for space application (SQUID magnetometer) --- Spacelab payload
[BMFT-FB-W-79-01] N80-23586
Design considerations of a flow system for transient laser discharge experiments
[AD-A080942] N80-23642
Mechanical design for a large fusion laser system
[UCRL-82928] N80-23648
Direct solar pumped laser
[LA-7982-MS] N80-23651
Development of high-temperature turbine subsystem technology to a technology readiness status, phase 2
[FE-1806-48] N80-23662
Mod-1 wind turbine generator analysis and design report, volume 1
[NASA-CR-159495] N80-23775
MHD air heater development technology
[CONS-3005-T2] N80-23835
Investigation of the technical and economic feasibility of using pumped well-water energy storage systems
[SAND-79-7096] N80-23851
High resolution optical ranging system N80-24150

SYSTEMS MANAGEMENT
A management perspective on the role of information production in the organization
[AD-A081058] N80-24201

T

TAIL ASSEMBLIES
A study of panel loads and centers of pressure of three different cruciform aft-tail control surfaces of a wingless missile from Mach 1.60 to 3.70
[NASA-TM-81787] N80-23251

TAPE RECORDERS
Radar video pulse recording system
[AD-A081156] N80-23533
Video tape recording techniques for Seasat radar data
[AD-A081152] N80-23622
Optimum digital data storage on magnetic tape
[AD-A081049] N80-23996

TARGET ACQUISITION
Passive infrared surveillance. Part 2: Threshold-crossing receivers
[AD-A081723] N80-24159

TARGET RECOGNITION
A review of representation functions for probability of detection
[AD-A081734] N8[illegible]15

Telephotometric study of baseline visual range at Cedar Mountain, Utah, 21 April to 16 May 1978
[PB80-137383] N80-23928
Telephotometric study of baseline visual range at Cedar Mountain, Utah, 19 January to 6 March 1979
[PB80-142227] N80-23931
Radiometric measurements by the MIDAS 3 system at Key West. Volume 1: Cloud backgrounds
[AD-A081052] N80-23937
Summaries of some reports of 1978 concerning results of field experiments for visibility
[DFVLR-MITT-79-11] N80-23983
Field manual to determine detection or recognition range of a FLIR sensor
[AD-A081324] N80-24156

TARGETS
Modification of the aurora electromagnetic environment experiment and interpretation — electromagnetic field produced by a thick target using parallel plate transmission lines
[AD-A080804] N80-23534
Negative-hydrogen-ion production by backscattering from alkali-metal targets
[LBL-9992] N80-24144
Fabrication and characterization of cryogenic targets for inertial confinement fusion
[UCRL-15113] N80-24170

TASK COMPLEXITY
Task reduction systems
[MC-IW-95/78] N80-24020

TECHNOLOGICAL FORECASTING
Outlook for advanced concepts in transport aircraft
[NASA-TM-81810] N80-23283
Turbopropulsion combustion technology assessment
[AD-A080748] N80-23323
Preliminary definition and characterizations of solar industrial process heat technology and manufacturing plant for the year 2000
[LA-UR-79-2812] N80-23820
Federal Republic of Germany: Estimates of future energy/GDP relationships
[ORAU/IEA(M)-79-22] N80-23841
United Kingdom: Estimates of future energy/GDP relationship
[ORAU/IEA(M)-79-25] N80-23848
Canada: Estimates of future energy/GNP relationships
[ORAU/IEA(M)-79-24] N80-23849
Electric and hybrid vehicles in the urban future — market research
[CONF-791009-23] N80-24217

TECHNOLOGY ASSESSMENT
Turbopropulsion combustion technology assessment
[AD-A080748] N80-23323
Analysis of possible improvements of alloys due to directional eutectic solidification in zero gravity conditions
[ESA-TT-575] N80-23447
Basic studies for a new communication network. Part A: An integrated communication system with decentralized switching
[BMFT-FB-T-79-07-PT-A] N80-23551
Electricity from refuse — technology assessment
[NZERDC-44] N80-23803
Environmental development plans for energy technology programs
[DOE/EDP-0062] N80-23881
Computer science and technology: Selection of data entry equipment
[PB80-144322] N80-23998

TECHNOLOGY TRANSFER
Earth resources data project
[E80-10092] N80-23719
Integrated use of LANDSAT data for state resource management — Arizona, Georgia, North Dakota, and Texas
[E80-10095] N80-23722
Texas Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Unival software user's guide
[E80-10096] N80-23723
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Acceptance test procedures
[E80-10097] N80-23724
LANDSAT's role in state coastal management programs — New Jersey and Texas
[E80-10101] N80-23728
LANDSAT'S role in HUD 701 programs — New Jersey and South Dakota
[E80-10102] N80-23729
Computer processing support, volume 4
[E80-10118] N80-23743
Technical information dissemination plan for the US Department of Energy, ETS/Solar Divisions
[SERI/SP-69-071] N80-24205
How to gain access to information on science and technology for development from data bases via computer telecommunications
[PB80-133143] N80-24209

TECHNOLOGY UTILIZATION
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2D: Specific study no. 4, gyro accuracy requirements in a strap down inertial navigation system with GPS aiding for RPV missions
[AGARD-AR-147-VOL-2D] N80-23294
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2A: Specific application study no. 1, close air support
[AGARD-AR-147-VOL-2A] N80-23303
Fluid circulating pump operated by same incident solar energy which heats energy collection fluid
N80-23500
Energy storage technology-environmental implications of large scale utilization
[LA-UR-79-3095] N80-23801
Application of shallow solar ponds for industrial process heat: Case histories
[UCRL-82367] N80-23822
Process applications for geothermal energy resources
[COO-4896-T1] N80-23854
Analysis and design of a 100-kilowatt solar photovoltaic flat-panel power system for a machining and metalworking facility in Columbus, Ohio. Phase 1: Photovoltaic flat panel application experiment
[DOE/ET/23055-1] N80-23880

TECTONICS
Application of laser ranging and VLBI data to a study of plate tectonic driving forces — finite element method
N80-23910

TELECOMMUNICATION
Technologies of imaging for communication terminals
[BMFT-FB-T-79-38] N80-23554
How to gain access to information on science and technology for development from data bases via computer telecommunications
[PB80-133143] N80-24209

TELEPHONES
Video telephone system with data compression for increased commercial requirements
[BMFT-FB-T-79-01] N80-23550
Basic studies for a new communication network. Part A: An integrated communication system with decentralized switching
[BMFT-FB-T-79-07-PT-A] N80-23551

TELEPHOTOMETRY
Telephotometric study of baseline visual range at Cedar Mountain, Utah, 21 April to 16 May 1978
[PB80-137383] N80-23928
Telephotometric study of baseline visual range at Cedar Mountain, Utah, 19 January to 6 March 1979
[PB80-142227] N80-23931

TEMPERATE REGIONS
Role of Temperate Zone Forests in the World Carbon Cycle: Problem definition and Research Needs — conferences
[DOE/ET/10040-1] N80-23883

TEMPERATURE DEPENDENCE
Thermal stress analysis and the effect of temperature dependence of material properties on Doublet 3 limiter design — reactor materials
[GA-A-15626] N80-23700
Piezoelectricity in polyacrylonitrile — as a function of temperature
[AD-A081250] N80-24190

TEMPERATURE EFFECTS
The behavior of optical glass fibers at extreme temperatures
[PHL-1978-37] N80-24162

TEMPERATURE MEASURING INSTRUMENTS
Experimental investigation of an inexpensive sky temperature measuring device
[COO-4522-1] N80-23945

TENSILE STRENGTH
Tensile crack exposure tests. Report 3: Laboratory evaluation of series A beams with results from 1951 to 1975
[AD-A081302] N80-23892

TENSILE STRESS
Dynamics of a moving mass being abruptly stopped by a cable
[AD-A081158] N80-23887

TERRAIN
Nationwide forestry applications program: Corrections to forest reflectance as a function of low Sun angle and slope — Washington County, Missouri
[E80-10100] N80-23727

TERRESTRIAL RADIATION
A time variable model of Earth's albedo — for climatology studies and interpretation of satellite data
[NASA-CR-159259] N80-23935

TEST CHAMBERS
Ice crystal growth in a dynamic thermal diffusion chamber
[NASA-TP-1651] N80-23934

TEST FACILITIES
Cryogenic wind tunnels: A selected, annotated bibliography
[NASA-TM-80168] N80-23333
Oak Ridge Flywheel Evaluation Laboratory
[Y-2210] N80-23632

TEST STANDS
Development of a microprocessor-based instrument for static testing small rocket engines
[AD-A081083] N80-23367

TEXAS
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Sybsystem (RSIS): User's guide
[E80-10088] N80-23715
Development of a winter wheat adjustable crop calendar model — Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
Integrated use of LANDSAT data for state resource management — Arizona, Georgia, North Dakota, and Texas
[E80-10095] N80-23722
Texas Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Unival software user's guide
[E80-10096] N80-23723
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Acceptance test procedures
[E80-10097] N80-23724
LANDSAT's role in state coastal management programs — New Jersey and Texas
[E80-10101] N80-23728
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions — Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10108] N80-23733

THEMATIC MAPPING
LANDSAT'S role in HUD 701 programs — New Jersey and South Dakota
[E80-10102] N80-23729
Automatic interpretation of LANDSAT data to characterize the dispersion of suspended sediments in artifical reservoirs — Tres Marias Dam, Brazil
[E80-10110] N80-23737
Interpreting land use change through satellite imagery — Great Plains and Southeastern Alluvium Coast and Tidewater regions
[PB80-127277] N80-23754

THEOREM PROVING
Techniques for program verification N80-24001
Finding the global minimum of a function of one variable using the method of constant signed higher order derivatives
[AD-A081491] N80-24005
A lower bound for the permanents of certain (0,1)-matrices
[MC-ZW-111/78] N80-24092

Binary codes with minimum distance four
[MC-ZW-112/78] N80-24093
On the Diophantine equation 1k + 2k + ... + xk + R(x) = yz
[MC-ZW-113/78] N80-24094
Disjointness and quasifactors in topological dynamics
[MC-ZW-119/78] N80-24121

THERAPY
An experimental evaluation of selected rewarming therapies for the treatment of profound accidental hypothermia, part 2
[AD-A078292] N80-23978

THERMAL BATTERIES
LiSi and LiB as anodes in chloroaluminate thermal batteries
[AD-A081300] N80-23784

THERMAL CONDUCTIVITY
Thermal conductivity and diffusivity of engineering ceramics
[AD-A078540] N80-23465

THERMAL CONTROL COATINGS
Development of improved-durability plasma sprayed ceramic coatings for gas turbine engines
[NASA-TM-81512] N80-23313

THERMAL DIFFUSION
Thermal conductivity and diffusivity of engineering ceramics
[AD-A078540] N80-23465
Ice crystal growth in a dynamic thermal diffusion chamber
[NASA-TP-1651] N80-23934

THERMAL ENERGY
Attenuation of teleseismic P-waves within geothermal systems N80-23529
Thermal energy storage in aquifers: Preliminary information
[PNL-3062] N80-23793
Development of a solar thermal receiver for high temperature applications
[SERI/TP-333-485] N80-23800
Conceptual design of thermal energy storage systems for near-term electric utility applications
[NASA-CR-159577] N80-23842

THERMAL EXPANSION
Thermal and cryotechnical definition study on minicryogenerator system for space application (SQUID magnetometer) — Spacelab payload
[BMFT-FB-W-79-01] N80-23586

THERMAL FATIGUE
Fatigue at high temperatures: Examination of the behavior of gasturbine casting materials also in simultaneous temperature and strain cycles
[BMFT-FB-T-79-26] N80-23444

THERMAL MAPPING
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Application explorer mission A: Heat capacity mapping mission
[E80-10107] N80-23734
Study of geological structure of Sicily and other Italian areas --- Gulf of Orosei, East Sardinia
[E80-10108] N80-23735

THERMAL PROTECTION
Room temperature mechanical properties of shuttle thermal protection system materials
[NASA-TM-81786] N80-23682

THERMAL RESISTANCE
Significance of thermal contact resistance in two-layer thermal-barrier-coated turbine vanes
[NASA-TM-81483] N80-23310

THERMAL SHOCK
Preliminary study of methods for providing thermal shock resistance to plasma-sprayed ceramic gas-path seals
[NASA-TP-1561] N80-23453
Behavior of deep flaws in a thick-wall cylinder under thermal shock loading
[CONF-791123-3] N80-23697

THERMAL STABILITY
Explosives research and development: Recommendations and comments on unsolved problems
[LA-8124-MS] N80-23486

THERMAL STRESSES
Thermal stress analysis and the effect of temperature dependence of material properties on Doublet 3 limiter design --- reactor materials
[GA-A-15626] N80-23700

THERMIONIC POWER GENERATION
Selenide isotope generator for the Galileo Mission: Copper/water axially-grooved heat pipe topical report
[TES-33009-44] N80-23829

THERMIONICS
DOE/JPL advanced thermionic technology program
[NASA-CR-163134] N80-23818

THERMOCHEMISTRY
Thermochemical energy storage and transport program
[SAND-79-8208] N80-23825

THERMOCOUPLES
Experimental investigation of an inexpensive sky temperature measuring device
[COO-4522-1] N80-23945

THERMODYNAMIC EFFICIENCY
Proposition on energy analysis and economic efficiency
[SERI/RR-51-332] N80-23805
Passive solar calculation methods
[DSE/5221-T1] N80-23836
SOLPOND: A simulation program for salinity gradient solar ponds
[SERI/TP-351-559] N80-23856

THERMODYNAMIC PROPERTIES
Property screening and evaluation of ceramic turbine engine materials
[AD-A080963] N80-23322
Some comments on the endochronic theory of plasticity
[AD-A081825] N80-23689

THERMODYNAMICS
Kinetic and thermodynamic studies of liquid metal-oxygen systems using solid state electrochemical techniques N80-23428
Natural convection heat transfer from an external receiver
[SAND-78-8276] N80-23612
The equations of elasticity are special
[AD-A081668] N80-23695

THERMOELASTICITY
The equations of elasticity are special
[AD-A081668] N80-23695

THERMOELECTRIC GENERATORS
Selenide isotope generator for the Galileo Mission: Copper/water axially-grooved heat pipe topical report
[TES-33009-44] N80-23829

THERMOPHYSICAL PROPERTIES
HEROP: A computer program for the thermodynamic and thermophysical properties of helium, third edition
[OUEL-1289/79] N80-23413

THERMOPLASTIC RESINS
A thermoplastic device for real-time in situ recording of acoustical holograms
[AD-A081011] N80-23624

THERMOSPHERE
Sounding rocket program aeronomy: Neutral composition of the mesosphere and lower thermosphere during winter-anomaly conditions
[BMFT-FB-W-79-02] N80-23922

THICK FILMS
Non-Concentrating collectors for solar heating applications (medium temperature air heaters based on durable transparent films)
[ALO-4147-T1] N80-23817

THICK WALLS
Behavior of deep flaws in a thick-wall cylinder under thermal shock loading
[CONF-791123-3] N80-23697

THICKNESS
Development and testing of a microwave system to measure coal layer thickness up to 25 cm
[FE-8881-1] N80-23757

THIN FILMS
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells
[LBL-9916] N80-23785
Photovoltaic mechanisms in polycrystalline thins-film solar cells
[DSE/3412-T1] N80-23834
Vortices in superconducting films
[ISM-258] N80-24195
Model of the recrystallization mechanism of amorphous silicon layers created by ion implantation
[LBL-9990] N80-24196
Thin film annealing by ion bombardment
[PB80-125677] N80-24198

THREE DIMENSIONAL BOUNDARY LAYER
Development of three-dimensional turbulent boundary layers in incompressible flow with separation
[BU-239] N80-23618

THREE DIMENSIONAL FLOW
Numerical flow field program for aerodynamic heating analysis. Volume 1: Equations and results
[AD-A081471] N80-23255
Investigation of three-dimensional subsonic flow in straight cascades by means of potential flow calculations and experiments
[DFVLR-FB-79-09] N80-23264
Three dimensional flow investigation with a method of characteristics in the inlet region and the blade-to-blade channels of supersonic axial compressors
[ONERA-NT-1979-1] N80-23325
Finite element simulation of simple three-dimensional fully cavitating flows N80-23594

THRESHOLD CURRENTS
Passive infrared surveillance. Part 2: Threshold-crossing receivers
[AD-A081723] N80-24159

THRUST
Estimation of wind shear and thrust loss during STOL aircraft landing approach N80-23296

THRUST BEARINGS
Application of magnetic suspensions and fluid film bearings to energy storage flywheels
[SAND-79-7007] N80-23824

THRUST CHAMBERS
Cooling of high pressure rocket thrust chambers with liquid oxygen
[NASA-TM-81503] N80-23365

THRUST VECTOR CONTROL
Static calibration of a two-dimensional wedge nozzle with thrust vectoring and spanwise blowing
[NASA-TM-81161] N80-23317
Design and development of the quad redundant servoactuator for the space shuttle solid rocket booster thrust vector control N80-23507

THUNDERSTORMS
Storm hazards '79: F-106B operations summary
[NASA-TM-81779] N80-23262
A study of the variability of thunderstorm electrical events based on very-low-frequency electromagnetic data
[AD-A081305] N80-23944

THYRISTORS
An insulated-gate thyristor structure: Principles of operation and design N80-23560

TIDES
Investigation of tidal displacements of the Earth's surface by laser ranging to GEOS-3
[NASA-CR-156863] N80-23908
Validation of ocean tide models from satellite altimetry
[AD-A078294] N80-23961

TIMBER INVENTORY
Nationwide forestry applications program: Corrections to forest reflectance as a function of low Sun angle and slope --- Washington County, Missouri
[E80-10100] N80-23727

TIME
A comparison of intercontinental clock synchronization by VLBI and the NTS satellite
[NASA-TM-81063] N80-24124

TIME OPTIMAL CONTROL
Digital compensators for sampled systems and minimum time control
[ESA-TT-607] N80-24041

TIME SERIES ANALYSIS
Implicit strain-hardening formulation for creep analysis
[K/CSD/TM-30] N80-23702
Modern methods of multiple spectral density estimation
[AD-A081172] N80-24058
Time series analysis methods and applications increased interdisciplinary interaction could stimulate research breakthroughs
[AD-A081174] N80-24060

TIME SHARING
Preparation cost and dual-task performance: Further evidence against a general time-sharing factor
[AD-A080857] N80-23986
TIROS N SATELLITE
Environmental satellite imagery, April 1979
[PB80-130214] N80-23951
TITANIUM
Diffusionless transformations in titanium-nickel
N80-23427
Low temperature data handbook titanium and titanium alloys
[NPL-QU-53] N80-23448
Power metallurgy of titanium and titanium alloys. Citations from the Engineering Index data base
[PB80-805161] N80-23450
TITANIUM ALLOYS
The effects of deformation mode on the behavior of Ti-28%V and Ti-32%V alloys N80-23423
Quantitative fractography of a fatigued Ti-28 w/o V alloy
[AD-A079813] N80-23431
Adhesive bonding experiments for titanium 6 aluminum 4 vanadium (Ti6Al4V). Part 1: Anodization treatments
[AD-A081538] N80-23432
Low temperature data handbook titanium and titanium alloys
[NPL-QU-53] N80-23448
Power metallurgy of titanium and titanium alloys. Citations from the Engineering Index data base
[PB80-805161] N80-23450
TITANIUM OXIDES
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells
[LBL-9916] N80-23785
TOKAMAK DEVICES
Current generation with low-frequency waves
[PPPL-1624] N80-23581
Remarks on the use of deposition probes for analysis of tokamak boundary-layer plasmas
[ORNL/TM-7034] N80-24173
Experimental observation of plasma paramagnetism in a Tokamak
[COO-2387-115] N80-24174
Axisymmetric instability in a noncircular Tokamak: Experiment and theory
[COO-2387-116] N80-24175
TOMOGRAPHY
Positron emission tomography of the heart
[UCLA-12-1232] N80-23980
TOOLS
Orbiter door closure tools N80-23498
TOPOGRAPHY
Study of geological structure of Sicily and other Italian areas --- Gulf of Orosei, East Sardinia
[E80-10108] N80-23735
Integrated surveys of the natural resources in the Amazonia National Park (Topajos) based on LANDSAT images --- Brazil
[E80-10109] N80-23736
Pointbars: A comparative examination along the large Dutch rivers --- Netherlands
[REPT-2] N80-23760
Voorne-Putten: A landscape-ecological survey --- Rhine delta, Netherlands
[REPT-4] N80-23761
TOPOLOGY
Disjointness and quasifactors in topological dynamics
[MC-ZW-119/78] N80-24121
On a sufficient condition for the existence of G-compactifications
[MC-ZW-120/78] N80-24122
TORCHES
A high power inductively coupled plasma torch and impedance matching network
[AD-A080906] N80-24166
TOROIDAL PLASMAS
ANTIC: A code for calculation of neutral transport in cylindrical plasmas
[SAI-79-1056-LJ] N80-24180
TORPEDOES
Test and evaluation of MK 37 torpedo batteries
[AD-A081642] N80-23543
TORQUE
Torque rheometers, application of the method. Part 1: Unplasticized PVC
[DRIC-TRANS-5585-PT-1] N80-23636
TOWERS
Dynamics of a flexible rotor-tower system
[ASRL-TR-194-1] N80-23862
TOXIC HAZARDS
Assessment of potential exposure to friable insulation materials containing asbestos
[NASA-TM-81435] N80-23875
TOXICITY
Methods for the isolation and identification of polycyclic aromatic hydrocarbons found in complex mixtures and their possible toxicity by means of bioassay techniques N80-23398
TRACKING (POSITION)
Predictions of GPS X-Set performance during the places experiment
[AD-A081552] N80-23292
Precision controllability of the YF-17 airplane
[NASA-TP-1677] N80-23327
TRACKING RADAR
Functional and operational advances in the AFGL rocket trajectory system-I
[AD-A081447] N80-23349
TRACTION
Evaluation of the traction characteristics of three lubricants
[AD-A080968] N80-23658
TRAINING DEVICES
Low-cost computer-aided instruction/computer-managed instruction CAI/CMI system: Feasibility study
[AD-A081072] N80-24014
TRAJECTORY ANALYSIS
General perturbations theories derived from the 1965 lane drag theory
[AD-A081264] N80-23347
TRANSCENDENTAL FUNCTIONS
Jacobi functions: The addition formula and the positivity of the dual convolution structure
[MC-TW-177/78] N80-24085
TRANSFER OF TRAINING
Platform motion contributions to simulator training effectiveness. Study 3: Interaction of motion with field-on-view
[AD-A078426] N80-23334
TRANSFORMATIONS (MATHEMATICS)
Transforming static data structures to dynamic structures
[AD-A081438] N80-24008
Equivalence of LCP and PLS --- linear complementarity and piecewise linear systems
[AD-A080890] N80-24016
Transformation of a discrete distribution to near normality
[AD-A080886] N80-24104
The selection of an extreme-value distribution
[AD-A080884] N80-24105
The large sample behavior of transformations to normality
[AD-A080885] N80-24106
Disjointness and quasifactors in topological dynamics
[MC-ZW-119/78] N80-24121
TRANSIENT RESPONSE
User's manual to the ACTION computer code
[NASA-CR-144973] N80-23680
TRANSITION FLOW
The thermal and hydrodynamic behavior of thick, rough-wall, turbulent boundary layers N80-23592
TRANSMISSION CIRCUITS
Field tests of the Liberty-Mead transmission system
[PB80-125610] N80-23591
TRANSMISSION LINES
Modification of the aurora electromagnetic environment experiment and interpretation --- electromagnetic field produced by a thick target using parallel plate transmission lines
[AD-A080804] N80-23534
Proceedings of the Workshop on Electrical and Biological Effects Related to HYDC Transmission
[PNL-3121] N80-23979
TRANSMISSIVITY
The measurement of the transmission and the emission of the atmosphere by an infrared teleradiance meter
[PHL-1978-50] N80-23923
TRANSMITTANCE
Detection of clear-air turbulence by water vapour emission variations: Transmittances and weighting functions
[PB80-130339] N80-23952
Computerized method for the generation of molecular transmittance functions in the infrared region
[AD-A081789] N80-24139
TRANSMITTERS
Cosmos. Meteosat: Meteorological Data Distribution (MDD) on Meteosat
[REPT-2786/85-TEA] N80-23353
TRANSONIC FLOW
Finite element analysis of subsonic, transonic and supersonic flows around missiles
[AD-A077375] N80-23261
Summary of data required for the AGARD SMP activity standard aeroelastic configurations - two-dimensional configurations
[NLR-MP-79015-U] N80-23273
Shock-boundary layer interaction effects in transonic flow fields
[AD-A080889] N80-23801
Development of perturbation procedures for nonlinear inviscid and viscous flows --- transonic flow
[AD-A081531] N80-23805
TRANSONIC SPEED
Analysis of experiments on the effects of jet plumes on pressure distribution over a cylindrical afterbody at transonic speeds
[AD-A081647] N80-23259
TRANSONIC WIND TUNNELS
TWINTAN: A program for transonic wall interference assessment in two-dimensional wind tunnels
[NASA-TM-81819] N80-23332
TRANSPORT AIRCRAFT
Conceptual studies of a long-range transport with an upper surface blowing propulsive lift system
[NASA-TM-81196] N80-23249
Outlook for advanced concepts in transport aircraft
[NASA-TM-81810] N80-23283
Design, development and implementation of an active control system for load alleviation for a commercial transport airplane
[AGARD-AR-683] N80-23331
Flight service evaluation of Kevlar-49 epoxy composite panels in wide-bodied commercial transport aircraft
[NASA-CR-159231] N80-23371
TRANSPORT PROPERTIES
Numerical studies of physical vapor transport
N80-23388
Determination of the effect of composition, structure and electrochemical mass transport properties on adhesion and corrosion inhibition of paint films
[AD-A080960] N80-23578
Investigation of laser optical biasing on the quantum transport properties of n-InSb
[AD-A081578] N80-23644
ANTIC: A code for calculation of neutral transport in cylindrical plasmas
[SAI-79-1056-LJ] N80-24180
TRANSPORTATION
Thermochemical energy storage and transport program
[SAND-79-8208] N80-23825
Energy policy impact evaluation
[PB80-137953] N80-23866
TRAPPED MAGNETIC FIELDS
Intense ion beam applications to magnetic confinement fusion
[COO-4460-2] N80-24176
TRAPPED PARTICLES
The collective acceleration mechanism of solar cosmic rays --- nuclei trapped by electron bunching
[IFVE-OTF-78-112] N80-24246
TRAVELING WAVE TUBES
AN/TPQ-37 transmitter tube improvements
[AD-A081393] N80-23565
Efficiency improvements in coupled cavity traveling wave tubes
[AD-A080961] N80-23575
AN/TPQ-37 transmitter test bed
[AD-A081591] N80-23576
TRAVELING WAVES
Run for your life. A note on the asymptotic speed of propagation of an epidemic
[MC-TW-176/78] N80-24117

TRAYS
Drawer drive for space shuttle vacuum canister --- long duration exposure facility N80-23518
TREES (MATHEMATICS)
Data structures for calculating flows in storm sewer systems
[NPL-NACS-20/79] N80-23617
Concurrent manipulation of binary trees, revision
[AD-A081443] N80-24012
An adaptive branching rule for the permutation flow-shop problem
[MC-BW-91/78] N80-24115
TRIANGULATION
Improved coordinates of features in the vicinity of the Viking lander site on Mars
[NASA-CR-153193] N80-24236
TROMBE WALLS
Residential passive solar systems: Regional sensitivity to system performance costs, and alternative prices
[LA-UR-79-3390] N80-23807
TUNABLE LASERS
Intracavity absorber effects in a CW dye laser
[COO-4448-2] N80-23647
Studies of laser selective excitation of atoms --- radiative lifetimes, plasma diagnostics, and vapor ionization
[UTIAS-229] N80-24138
TURBINE BLADES
Unsteady aerodynamic forces on a subsonic rectilinear cascade of blades
[PNR-90007] N80-23266
Significance of thermal contact resistance in two-layer thermal-barrier-coated turbine vanes
[NASA-TM-81483] N80-23310
TURBINES
Mod-1 wind turbine generator analysis and design report, volume 1
[NASA-CR-159495] N80-23775
The aerodynamics of axial flow wind power turbines
[CSIR-ME-1619] N80-23781
Millville Wind Turbine Generator: Failure analysis and corrective design modification
[RFP-2992/3533/79-3] N80-23831
Vertical axis wind turbine development: Executive summary
[ORO-5135-77-5-SUMM] N80-23845
Vertical axis wind turbine development
[ORO-5135-77-5] N80-23846
TURBOCOMPRESSORS
Three dimensional flow investigation with a method of characteristics in the inlet region and the blade-to-blade channels of supersonic axial compressors
[ONERA-NT-1979-1] N80-23325
TURBOFAN ENGINES
CF6 jet engine performance improvement: New fan
[NASA-CR-159699] N80-23309
Turbopropulsion combustion technology assessment
[AD-A080746] N80-23323
F100 exhaust nozzle area control N80-23513
Status of NASA full-scale engine aeroelasticity research
[NASA-TM-81500] N80-23678
Far-field radiation of aft turbofan noise
[NASA-TM-81506] N80-24129
TURBOFANS
CF6 jet engine performance improvement: New fan
[NASA-CR-159699] N80-23309
TURBOGENERATORS
Electricity from refuse --- technology assessment
[NZERDC-44] N80-23803
TURBOJET ENGINES
Atmospheric dispersion of high velocity jets
[AD-A081612] N80-23321
Engine environmental effects on composite behavior
[NASA-TM-81506] N80-23370
A primitive variable mathematical model for predicting the flows in turbojet test cells
[AD-A081539] N80-23611
Status of NASA full-scale engine aeroelasticity research
[NASA-TM-81500] N80-23678
TURBOPROP AIRCRAFT
Acoustic test and analyses of three advanced turboprop models
[NASA-CR-159667] N80-23311
TURBULENCE
The turbulent fluxes of momentum and sensible heat over the open sea during moderate to strong winds
[AD-A081392] N80-23943
TURBULENT BOUNDARY LAYER
The thermal and hydrodynamic behavior of thick, rough-wall, turbulent boundary layers N80-23592
Shock-boundary layer interaction effects in transonic flow fields
[AD-A080889] N80-23601
Prediction of separating turbulent boundary layers including regions of reversed flow
[AD-A081592] N80-23608
A calculation method for convective heat and mass transfer in multiply-slotted film-cooling applications
[AD-A081641] N80-23609
Development of three-dimensional turbulent boundary layers in incompressible flow with separation
[BU-239] N80-23618
Update on the low wave number content of TBL pressure fields N80-24249
TURBULENT DIFFUSION
Chemical reactions in a turbulent medium
[ONERA-NT-1979-2] N80-23412
TURBULENT FLOW
Chemical reactions in a turbulent medium
[ONERA-NT-1979-2] N80-23412
Laminar flow cyclone development program
[FE-3242-2] N80-23613
Turbulent transport phenomena --- experimental measurement techniques
[AGARD-AR-150] N80-23620
TURBULENT JETS
On the organized large-scale structure in a turbulent round jet and its far-field sound N80-23593
TURBULENT MIXING
A wake boundary layer mixing experiment
[NLR-MP-79012-U] N80-23272
Laminar flow cyclone development program
[FE-3242-2] N80-23613
TURBULENT WAKES
A wake boundary layer mixing experiment
[NLR-MP-79012-U] N80-23272
TURING MACHINES
A finite state lexical analyzer for the standard hardware representation of ALGOL 68
[MC-IW-98/78] N80-24023
TWO BODY PROBLEM
Linear least-squares analysis and effective interactions --- as applied to nuclear data
[UCRL-82587] N80-24064
TWO DIMENSIONAL FLOW
Development of perturbation procedures for nonlinear inviscid and viscous flows --- transonic flow
[AD-A081531] N80-23605
TWO PHASE FLOW
Two-phase working fluids for the temperature range of 50 to 350 deg, phase 2
[NASA-CR-159847] N80-23599
Measurement of the thickness of liquid film by means of capacitance method
[EPRI-NP-1212] N80-23614
TWO STAGE TURBINES
Conceptual design study of an improved gas turbine powertrain
[NASA-CR-159852] N80-23315

U

U.S.S.R.
Ideas of I. M. Sechenov in aviation and space medicine
[NASA-TM-75976] N80-23973
ULTRAHIGH FREQUENCIES
Dual band combiner for horn antenna
[NASA-CASE-NPO-14519-1] N80-23524
Technology for the monolithic integration of UHF devices
[BMFT-FB-T-79-13] N80-23553
ULTRASONIC FLAW DETECTION
Analysis of ultrasonic flowmeters for leak detection in liquid hydrocarbon pipelines
[AD-A081791] N80-24132
ULTRASONIC TESTS
Ultrasonic nondestructive testing of materials --- graphite-epoxy and boron-epoxy composite materials
[AD-A078370] N80-23667
Signal processing for higher frequency ultrasonic imaging N80-24125
ULTRAVIOLET LASERS
Multiquantum ultraviolet excitation of atoms and molecules N80-24135
ULTRAVIOLET RADIATION
Atmospheric Rayleigh scattering in the ultraviolet and visible spectral region
[ESA-TT-588] N80-23926
ULTRAVIOLET SPECTROMETERS
A polarimeter for the high resolution ultraviolet spectrometer/polarimeter --- Solar Maximum Mission N80-23520
UNDERGROUND STORAGE
Fixed site hydrogen storage. 1: Applications impact
[SAND-79-8647] N80-23797
UNDERWATER ACOUSTICS
The interaction of sound with noise in water N80-24128
UNITED KINGDOM
United Kingdom: Estimates of future energy/GDP relationship
[ORAU/IEA(M)-79-25] N80-23848
UNITED STATES OF AMERICA
Data handbook for the National Solar Energy demonstration program
[DSE/5216-T3] N80-23815
Environmental data for sites in the National Solar Data Network
[SOLAR/0010-79/05] N80-23833
UNIVERSE
Cosmology: Citations from the NTIS data base
[PB80-804818] N80-24231
UNIVERSITY PROGRAM
California Sea Grant College Program: An overview 1977 - 1978
[PB80-127988] N80-23954
UNSTEADY FLOW
Summary of data required for the AGARD SMP activity standard aeroelastic configurations two-dimensional configurations
[NLR-MP-79015-U] N80-23273
Axial flow rotor unsteady performance N80-23306
Stability of modulated rotating fluids --- Galerkin method N80-23595
UNSTEADY STATE
Axial flow rotor unsteady performance
[AD-A081107] N80-23318
UPPER ATMOSPHERE
Research in aeronomy
[NASA-CR-153189] N80-24257
UPPER SURFACE BLOWN FLAPS
Conceptual studies of a long-range transport with an upper surface blowing propulsive lift system
[NASA-TM-81196] N80-23249
URBAN DEVELOPMENT
LANDSAT'S role in HUD 701 programs --- New Jersey and South Dakota
[E80-10102] N80-23729
URBAN TRANSPORTATION
Electric and hybrid vehicles in the urban future --- market research
[CONF-791009-23] N80-24217
UREAS
Reverse osmosis membrane of high urea rejection properties --- water purification
[NASA-CASE-ARC-10980-1] N80-23452
USER MANUALS (COMPUTER PROGRAMS)
Easy-ACIS dynamic analysis. User's manual
[AD-A081160] N80-23258
User's manual to the ACTION computer code
[NASA-CR-144973] N80-23680
Texas Natural Resources Inventory and Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Sybsystem (RSIS): User's guide
[E80-10088] N80-23715
Operations manual for the LANDSAT Imagery, Verification and Extraction System (LIVES)
[E80-10090] N80-23717
Users manual for the LANDSAT Imagery Verification and Extraction System (LIVES)
[E80-10091] N80-23718

Texas Monitoring System (TNRIMS), Applications System Verification and Transfer (ASVT), Remote Sensing Information Subsystem (RSIS): Unival software user's guide
[E80-10096] N80-23723

USER REQUIREMENTS
Global Positioning Systems (GPS) High Dynamic User Equipment (HDUE). Volume 2: Set description
[AD-A076480] N80-23290
Global Positioning System (GPS) High Dynamic User Equipment (HDUE). Volume 3: Set description
[AD-A076481] N80-23291
A management perspective on the role of information production in the organization
[AD-A081058] N80-24201

UTAH
Categorization of watershed land cover units with LANDSAT data --- semiarid watershed in Utah
N80-23712

UTILITIES
Summary and evaluation of the parametric study of potential early commercial MHD power plants (PSPEC)
[NASA-TM-81497] N80-23780
Optimal design of compressed air energy storage systems
[CONF-791069-3] N80-23789

V

V/STOL AIRCRAFT
On the interaction of wall jets and fountain formation
[AD-A081540] N80-23607

VACUUM
On vacuum fluctuations of a scalar field in a localized region of spacetime N80-24199

VACUUM CHAMBERS
Drawer drive for space shuttle vacuum canister --- long duration exposure facility N80-23518

VANADIUM
Hydrogen embrittlement in vanadium single crystals
[ISM-249] N80-23441

VANADIUM ALLOYS
The effects of deformation mode on the behavior of Ti-28%V and Ti-32%V alloys N80-23423

VAPOR DEPOSITION
Response of infrared-transparent materials to raindrop impacts --- zinc sulfides
[AD-A081542] N80-23374

VAPOR PHASES
Numerical studies of physical vapor transport
N80-23388

VAPORIZERS
Potential heat exchange fluids for use in sulfuric acid vaporizers
[NASA-CASE-NPO-15015-1] N80-23394

VARIABLE STARS
Pulsation of high luminosity helium stars
[LA-UR-79-2785] N80-24223
Rapid oscillations in cataclysmic variables
N80-24228

VARIANCE (STATISTICS)
On the choice of variance for the log rank test
[AD-A080296] N80-24101

VECTOR ANALYSIS
A nonlinear vector finite difference scheme
[MC-BW-89/78] N80-24069

VEGETATION
Categorization of watershed land cover units with LANDSAT data --- semiarid watershed in Utah
N80-23712
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Lower Rio Grande Valley Test Site: Weslaco, Texas; Falco Reservoir and the Gulf of Mexico
[E80-10106] N80-23733
Integrated surveys of the natural resources in the Amazonia National Park (Topajos) based on LANDSAT images --- Brazil
[E80-10109] N80-23736
The application of remote sensing technology to the solution of problems in the management of resources in Indiana --- pheasant habitats in Benton County, soil mapping in Jasper County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23738

VEGETATION GROWTH
LANDSAT'S role in HUD 701 programs --- New Jersey and South Dakota
[E80-10102] N80-23729

VELOCITY DISTRIBUTION
Investigation of velocity field about a two dimensional plexiglass ogival foil using the laser doppler anemometer
[AD-A081765] N80-23639
Velocity distribution in a pinched beam
[UCID-18303] N80-24177
Analysis of lunar seismic signals: Determination of instrumental parameters and seismic velocity distribution N80-24232
The effect of transport phenomena on electron velocity distribution functions and ion abundances in the solar chromosphere-corona transition region
N80-24239

VELOCITY MEASUREMENT
The Urbana coherent-scatter radar: Synthesis and first results
[NASA-CR-153186] N80-23531

VENUS ATMOSPHERE
Application of advanced computational procedures for modeling solar-wind interactions with Venus: Theory and computer code
[NASA-CR-3267] N80-24240

VERTICAL MOTION
Operations manual: Vertical Motion Simulator (VMS) S.08
[NASA-TM-81180] N80-23295

VERTICAL ORIENTATION
Vertical axis wind turbine development: Executive summary
[ORO-5135-77-5-SUMM] N80-23845
Vertical axis wind turbine development
[ORO-5135-77-5] N80-23846

VERY LONG BASE INTERFEROMETRY
Application of laser ranging and VLBI data to a study of plate tectonic driving forces --- finite element method N80-23910
A comparison of intercontinental clock synchronization by VLBI and the NTS satellite
[NASA-TM-81063] N80-24124

VHF OMNIRANGE NAVIGATION
A flight investigation of system accuracies and operational capabilities of a general aviation/air transport area navigation system (RNAV)
[AD-A081646] N80-23288

VIBRATION
Shock and vibration performance of an epoxy chocking compound
[AD-A078496] N80-23468
The Shock and Vibration Digest, volume 11, no. 9
[AD-A074320] N80-23490
Progressive settlements of foundations on cohesionless soils subjected to vertical vibratory loadings N80-23494
The Shock and Vibration Digest, volume 11, no. 11
[AD-A078375] N80-23669
A review of substructure analysis of vibrating systems N80-23670
The Shock and Vibration Digest, volume 11, no.8
[AD-A073239] N80-24247
The Shock and Vibration Digest, volume 11, no. 10
[AD-A078374] N80-24250
The Shock and Vibration Digest, volume 11, no. 2
[AD-A079549] N80-24254

VIBRATION DAMPING
Damping in structural joints N80-23492
Critical damping in linear discrete dynamic systems
[AD-A081085] N80-23688

VIBRATION ISOLATORS
Investigations of the design of active vibration isolation systems for helicopters with rigid and elastic modeling of the fuselage
[ESA-TT-556] N80-23300
Computer programs: Shock and vibration isolation
N80-23671
Optimization techniques for shock and vibration isolator development N80-24253

VIBRATION MEASUREMENT
Techniques and applications of mechanical signature analysis N80-23491
Technical manual: Primary data reduction programs for the Eclipse S-200/230 shock and vibration measurement systems
[SAND-79-8054] N80-23698

VIBRATORY LOADS
A survey of structural optimization under dynamic constraints N80-24256

VIDEO COMMUNICATION
Video telephone system with data compression for increased commercial requirements
[BMFT-FB-T-79-01] N80-23550

VIDEO EQUIPMENT
Radar video pulse recording system
[AD-A081156] N80-23533
Video telephone system with data compression for increased commercial requirements
[BMFT-FB-T-79-01] N80-23550

VIKING LANDER 1
Improved coordinates of features in the vicinity of the Viking lander site on Mars
[NASA-CR-153193] N80-24236

VISCOELASTICITY
Evaluation of the traction characteristics of three lubricants
[AD-A080968] N80-23658
Studies in the small motions of viscoelastic solids
N80-23673
Applications of generalized derivatives to viscoelasticity
[AD-A081131] N80-23686
Computer analysis of shells and composites
[AD-A081469] N80-23690

VISCOMETERS
Two-phase working fluids for the temperature range of 50 to 350 deg, phase 2
[NASA-CR-159847] N80-23599

VISCOPLASTICITY
Mechanical modelization of microstructural instabilities in cyclic viscoplasticity at variable temperature
[ONERA-NT-1979-6] N80-23445
Some comments on the endochronic theory of plasticity
[AD-A081825] N80-23689

VISCOUS DAMPING
Critical damping in linear discrete dynamic systems
[AD-A081085] N80-23688

VISCOUS FLOW
Development of perturbation procedures for nonlinear inviscid and viscous flows --- transonic flow
[AD-A081531] N80-23605

VISIBILITY
IRemote sensing methods for determination of slant range visibility
[DFVLR-FB-79-14] N80-23759
Aerosol, trace elements and visibility measurements in mountainous terrain
[PNL-SA-7576] N80-23882
Characterization of visibility-reducing aerosols in the Southwest. Project VISTA
[PB80-139041] N80-23929
Telephotometric study of baseline visual range at Cedar Mountain, Utah, 19 January to 6 March 1979
[PB80-142227] N80-23931
Summaries of some reports of 1978 concerning results of field experiments for viability
[DFVLR-MITT-79-11] N80-23983

VISUAL CONTROL
Determination of boundaries for kinematic intercept regions and evaluation of the miss distance for Line-Of-Sight (LOS)-guided missiles
[DFVLR-FB-79-13] N80-23354

VISUAL DISCRIMINATION
Telephotometric study of baseline visual range at Cedar Mountain, Utah, 21 April to 16 May 1978
[PB80-137383] N80-23928
Telephotometric study of baseline visual range at Cedar Mountain, Utah, 19 January to 6 March 1979
[PB80-142227] N80-23931

VISUAL FIELDS
Telephotometric study of baseline visual range at Cedar Mountain, Utah, 21 April to 16 May 1978
[PB80-137383] N80-23928

VISUAL FLIGHT
Visually Coupled System: Computer Generated Imagery (VCS-CGI) engineering interface
[AD-A080931] N80-23306

VISUAL PERCEPTION
Platform motion contributions to simulator training effectiveness. Study 3: Interaction of motion with field-on-view
[AD-A078426] N80-23334

VOICE
Channels that cooperatively service a data stream and voice messages, 1
[AD-A081616] N80-23538
VOICE COMMUNICATION
Channels that cooperatively service a data stream and voice messages. Part 2: Diffusion approximations
[AD-A081617] N80-23540
VOLCANOES
Volcanic features of Hawaii. A basis for comparison with Mars
[NASA-SP-403] N80-23912
Evolution of the early lunar crust: The role of impact melting, secondary cratering, and highland volcanism
N80-24234
VOLCANOLOGY
Comprehensive study of the seismotectonics of the eastern Aleutian arc and associated volcanic systems
[COO-3134-20] N80-23919
VOLTAGE REGULATORS
The ac-dc power processor, type 1
[AD-A081545] N80-23577
VOLTERRA EQUATIONS
Nonlinear system identification study. Part 1: Implementation feasibility study
[AD-A081464] N80-23990
On the stability of multistep formulas for Volterra integral equations of the second kind
[MC-NW-59/78] N80-24076
On the stability of multistep formulas for systems of Volterra integro-differential equations
[MC-NW-63/78] N80-24078
VORTEX RINGS
Morphological-phenomenological examination of the interaction of two ring vortices with the same translation axis and direction
[MPIS-20/1978] N80-23262
Interaction of two ring vortices with different translation axis and formation of new ring vortices from an oscillating ring vortex
[MPIS-2/1979] N80-23615
VORTICES
Active control of asymmetric vortex effects
[AD-A081648] N80-23254
Opportunities analysis of potential advanced vortex systems separation standards
[AD-A081479] N80-23281
Procedural feasibility of reduced spacing under WVAS operation with applications to Atlanta and O'Hare
[AD-A081480] N80-23287
Experiments with rotational symmetric supersonic free jets with laser-induced I2 fluorescence
[MPIS-7/1979] N80-23616
Rhythmic vortex currents and their significance in human physiology
[MPIS-1/1979] N80-23982
Dynamic properties of vortices in Josephson tunnel junctions N80-24184
Vortices in superconducting films
[BM-258] N80-24195
VULNERABILITY
The VIMAS subsonic aerodynamic nuclear gust vulnerability code
[AD-A081722] N80-23256

W

WAFERS
Development and fabrication of a solar cell junction processing system
[NASA-CR-153194] N80-23773
WALL JETS
On the interaction of wall jets and fountain formation
[AD-A081540] N80-23607
Laminar flow cyclone development program
[FE-3242-2] N80-23613
WALL TEMPERATURE
Thermal stress analysis and the effect of temperature dependence of material properties on Doublet 3 limiter design --- reactor materials
[GA-A-15626] N80-23700
WARNING SYSTEMS
Passive intrusion detection system
[NASA-CASE-NPO-13804-1] N80-23559
WASTE DISPOSAL
SWARU: Solid waste disposal resource system
[NP-24196] N80-24146
WASTE ENERGY UTILIZATION
Naval facility energy conversion plants as resource recovery system components
[AD-A081232] N80-23783
Solar production of industrial process steam ranging in temperature from 300 degrees F to 550 degrees F, phase 1. Volume 2: Appendices
[DOE/CS-32199-2] N80-23813
SWARU: Solid waste disposal resource system
[NP-24196] N80-24146
WASTE UTILIZATION
Electricity from refuse --- technology assessment
[NZERDC-44] N80-23803
WATER
Measurement of the thickness of liquid film by means of capacitance method
[EPRI-NP-1212] N80-23614
Photolytic decomposition of water into oxygen and hydrogen as an alternative energy utilization of households and small consumers
[ESA-TT-582] N80-23865
WATER HEATING
Solar hot water system installed at Quality Inn, Key West, Florida
[NASA-CR-161434] N80-23774
Research and development of an air-cycle heat-pump water heater
[ORNL/SUB-7226/1] N80-23850
WATER QUALITY
Land use intensity and water quality --- of watersheds tributary to the Potomac River N80-23714
Earth resources data project
[E80-10092] N80-23719
Automatic interpretation of LANDSAT data to characterize the dispersion of suspended sediments in artifical reservoirs --- Tres Marias Dam, Brazil
[E80-10110] N80-23737
WATER TREATMENT
Reverse osmosis membrane of high urea rejection properties --- water purification
[NASA-CASE-ARC-10980-1] N80-23452
WATER VAPOR
Detection of clear-air turbulence by water vapour emission variations: Transmittances and weighting functions
[PB80-130339] N80-23952
WATERSHEDS
Categorization of watershed land cover units with LANDSAT data --- semiarid watershed in Utah
N80-23712
Hydrologic evaluation of the stormflow generation process on a forested watershed --- Pennsylvania
N80-23713
Land use intensity and water quality --- of watersheds tributary to the Potomac River N80-23714
LANDSAT 9 role in HUD 701 programs --- New Jersey and South Dakota
[E80-10109] N80-23729
WAVE ATTENUATION
The frequency dependence of Q --- anelastic attenuation in the earth N80-24001
WAVE EQUATIONS
Eigenvalue and near Eigenvalue problems solved by Bigeldt's multigrid method
[AD-A081316] N80-24062
WAVE EXCITATION
Current generation with low-frequency waves
[PPPL-1624] N80-23581
WAVE INTERACTION
Interaction of large amplitude stress waves in layered elastic-plastic materials
[AD-A081429] N80-23691
WAVE SCATTERING
A general theory for the scattering of sound by sound with parametric array applications N80-24126
Normal mode acoustic scattering from elastic cylindrical shells N80-24127
WAVEGUIDES
An analytical and experimental investigation of planar discontinuities in coaxial waveguides
N80-23526
Analysis of multimode fiber couplers, tapers and mode converters
[AD-A081669] N80-24154
Evaluation of NRL glass for fiber optics, phase 1 --- for use as waveguides
[AD-A081582] N80-24155
WEAR
Practical applications of surface analytic tools in tribology
[NASA-TM-81484] N80-23430
WEATHER FORECASTING
Recommended changes in meteorological measurement and prediction methods for coastal sites
[BNL-26840] N80-23948
WEATHERING
Tensile crack exposure tests. Report 3: Laboratory evaluation of series A beams with results from 1951 to 1975
[AD-A081302] N80-23692
WEBS (SUPPORTS)
The effect of foamed hard plastic stiffeners on aluminum shear webs
[BU-237] N80-23707
WEDGES
Pressure distribution measurements on wedges at subsonic and transonic velocities --- in a transonic wind tunnel
[ESA-TT-554] N80-23267
An investigation of loads on wedges placed in supersonic jets
[BU-235] N80-23275
WEIGHT REDUCTION
The effect of a saturated shield design on the design, weight, and performance of superconductive acyclic machinery
[AD-A080919] N80-23573
WEIGHTING FUNCTIONS
Detection of clear-air turbulence by water vapour emission variations: Transmittances and weighting functions
[PB80-130339] N80-23952
Large deviations of multivariate-L-estimators with monotone weight functions
[MC-SW-63/78] N80-24112
WEIGHTLESSNESS
Analysis of possible improvements of alloys due to directional eutectic solidification in zero gravity conditions
[ESA-TT-575] N80-23447
WELDED JOINTS
Fatigue in welded metal structures: An introductory report to a research program
[LPC-85] N80-23704
WELDING
Method and apparatus for holding two separate metal pieces together for welding
[NASA-CASE-GSC-12316-1] N80-23655
WELLS
Investigation of the technical and economic feasibility of using pumped well-water energy storage systems
[SAND-79-7098] N80-23951
WETLANDS
LANDSAT's role in state coastal management programs --- New Jersey and Texas
[E80-10101] N80-23728
The application of remote sensing technology to the solution of problems in the management of resources in Indiana --- pheasant habitats in Benton County, ice mapping in Lake County, and the Pigeon River State Wildlife Area
[E80-10111] N80-23730
WHEAT
Crop phenology literature review for corn, soybean, wheat, barley, sorghum, rice, cotton, and sunflower
[E80-10099] N80-23720
Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721
Agricultural soil moisture experiment: 1978 Colby (Kansas) data catalog and documentation --- Thomas County, Kansas
[E80-10098] N80-23725
Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726
Sampling for area estimation: A comparison of full-frame sampling with the sample segment approach
[E80-10104] N80-23731

Evaluation of several schemes for classification of remotely sensed data: Their parameters and performance --- Foster County, North Dakota; Grant County, Kansas; Iroquois County, Illinois, Tippecanoe County, Indiana; and Pottawattamie and Shelby Counties, Iowa
[E80-10105] N80-23732

Applicability of selected wheat remote sensing technology to corn and soybeans
[E80-10112] N80-23739

Interpretation of LANDSAT digital data using a cubic color model based on relative energies
[E80-10119] N80-23745

Composition and assembly of a spectral data base for transition year spring wheat blind sites --- North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747

Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

WIDE ANGLE LENSES

Analysis of special components of the EUV-very wide angle camera
[BMFT-FB-W-79-04] N80-24160

WIDEBAND COMMUNICATION

Low-noise wide-band amplifier system for stochastic beam cooling experiments
[LBL-9841] N80-23580

WIENER HOPF EQUATIONS

Wiener-Hopf approaches to regulator, filter/observer, and optical coupler problems
[AD-A081489] N80-24049

WIND (METEOROLOGY)

Wind characteristics for agricultural wind energy applications
[PNL-SA-7270] N80-23947

Hawaii wind power survey: Fixed station data
[UHMET-79-15] N80-23948

WIND EFFECTS

Peak wind loads on cladding panels and their dependence upon panel size
[OUEL-1266/79] N80-23708

WIND MEASUREMENT

Dual-frequency Doppler-Lidar method of wind measurement
[AD-A080849] N80-23623

WIND PROFILES

Wind characteristics for agricultural wind energy applications
[PNL-SA-7270] N80-23947

WIND SHEAR

Estimation of wind shear and thrust loss during STOL aircraft landing approach N80-23296

Investigation of landing flare in presence of wind shear
[DFVLR-FB-79-20] N80-23299

WIND TUNNEL TESTS

A wake boundary layer mixing experiment
[NLR-MP-79015-U] N80-23273

Summary of data required for the AGARD SMP acoustic standard aeroelastic configurations two-dimensional configurations
[NLR-MP-79016-U] N80-23272

Wind tunnel tests on the Sheriff twin-engined light aircraft
[BU-241] N80-23277

Flight safety of Rogallo hang gliders: Theoretical and experimental study of the flight envelope
[ONERA-NT-1979-8] N80-23301

WIND TUNNEL WALLS

TWINTAN: A program for transonic wall interference assessment in two-dimensional wind tunnels
[NASA-TM-81819] N80-23332

Comparative measuremnets in four European wind tunnels of the unsteady pressures on an oscillating model
[AGARD-R-673] N80-23338

WIND VELOCITY

The turbulent fluxes of momentum and sensible heat over the open sea during moderate to strong winds
[AD-A081392] N80-23943

WINDMILLS (WINDPOWERED MACHINES)

Dynamics of a flexible rotor-tower system
[ASRL-TR-194-1] N80-23862

WINDPOWER UTILIZATION

Conversion system overview assessment. Volume 2: Solar-wind hybrid systems
[SERI/TR-35-078-VOL-2] N80-23799

Wind characteristics for agricultural wind energy applications
[PNL-SA-7270] N80-23947

WINDPOWERED GENERATORS

Mod-1 wind turbine generator analysis and design report, volume 1
[NASA-CR-159495] N80-23775

The aerodynamics of axial flow wind power turbines
[CSIR-ME-1619] N80-23781

Millville Wind Turbine Generator: Failure analysis and corrective design modification
[RFP-2992/3533/79-3] N80-23831

Vertical axis wind turbine development: Executive summary
[ORO-5135-77-5-SUMM] N80-23845

Vertical axis wind turbine development
[ORO-5135-77-5] N80-23846

WING PANELS

An investigation of residual stresses in simulated wing panels of 7075-T6 aluminum
[AD-A080863] N80-23693

WINGS

An aeroelastic analysis of the Sheriff wing
[BU-234] N80-23274

WINTER

Development of a winter wheat adjustable crop calendar model --- Colorado, Idaho, Oklahoma, Montana, Kansas, Missouri, North Dakota and Texas
[E80-10094] N80-23721

Sounding rocket program aeronomy: Neutral composition of the mesosphere and lower thermosphere during winter-anomaly conditions
[BMFT-FB-W-79-02] N80-23922

WISCONSIN

Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726

WORKING FLUIDS

Two-phase working fluids for the temperature range of 50 to 350 deg: phase 2
[NASA-CR-159647] N80-23599

Solar collector fluid parameter study
[PB80-125891] N80-23869

X

X RAY SCATTERING

ORNL 10-m small-angle X-ray scattering camera
[ORNL/TM-6342] N80-23630

X RAY SPECTRA

The solar impulsive hard X-ray spectrum
N80-24241

Y

YIELD

Variability of crop calendar stage dates --- Arkansas, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Nebraska, Ohio, South Dakota, and Wisconsin
[E80-10099] N80-23726

Composition and assembly of a spectral data base for transition year spring wheat blind sites --- North Dakota, South Dakota, Minnesota, and Montana
[E80-10121] N80-23747

Crop yield literature review for AgRISTARS crops: Corn, soybeans, wheat, barley, sorghum, rice, cotton, and sunflowers
[E80-10122] N80-23748

Z

ZINC ALLOYS

Stress corrosion characteristics of Al-Zn-Mg alloys with copper additions N80-23421

ZINC OXIDES

Methanol and methyl fuel catalysts --- CuO/ZnO catalysts
[FE-3177-3] N80-23482

ZINC SULFIDES

Response of infrared-transparent materials to raindrop impacts --- zinc sulfides
[AD-A081542] N80-23374

CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ADVANCED RESEARCH AND APPLICATIONS CORP., SUNNYVALE, CALIF.
Improvement in GaAs device yield and performance through substrate defect gettering
[AD-A081344] N80-24189

ADVISORY GROUP FOR AEROSPACE RESEARCH AND DEVELOPMENT, NEUILLY-SUR-SEINE (FRANCE).
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2D: Specific study no. 4, gyro accuracy requirements in a strap down inertial navigation system with GPS aiding for RPV missions
[AGARD-AR-147-VOL-2D] N80-23294
The impact of global positioning system on guidance and controls systems design of military aircraft. Volume 2A: Specific application study no. 1, close air support
[AGARD-AR-147-VOL-2A] N80-23303
Design, development and implementation of an active control system for load alleviation for a commercial transport airplane
[AGARD-AR-683] N80-23331
Comparative measuremnets in four European wind tunnels of the unsteady pressures on an oscillating model
[AGARD-R-673] N80-23338
Turbulent transport phenomena
[AGARD-AR-150] N80-23620

AEG-TELEFUNKEN, HEILBRONN (WEST GERMANY).
Technology for the monolithic integration of UHF devices
[BMFT-FB-T-79-13] N80-23553
Techniques for low noise and high power transistors in integrated circuits
[BMFT-FB-T-79-15] N80-23587

AEG-TELEFUNKEN, ULM (WEST GERMANY).
Video telephone system with data compression for increased commercial requirements
[BMFT-FB-T-79-01] N80-23550

AEG-TELEFUNKEN, BERLIN (WEST GERMANY).
Development of current converters for switching and regulating tasks in energy technology
[BMFT-FB-T-79-12] N80-23585
Basic studies for a new communication network. Part A: An integrated communication system with decentralized switching
[BMFT-FB-T-79-07-PT-A] N80-23551
Basic studies for a new communication network. Part B: Mobile radio telephone
[BMFT-FB-T-79-08] N80-23552

AEROSPACE CORP., EL SEGUNDO, CALIF.
Inhomogeneous broadening effects in CW chemical lasers
[AD-A077319] N80-23435

AEROSPACE DEFENSE COMMAND, PETERSON AFB, COLO.
General perturbations theories derived from the 1965 lane drag theory
[AD-A081264] N80-23347

AIR FORCE ACADEMY, COLO.
LiSi and LiB as anodes in chloroaluminate thermal batteries
[AD-A081300] N80-23784

AIR FORCE AERO PROPULSION LAB., WRIGHT-PATTERSON AFB, OHIO.
Turbopropulsion combustion technology assessment
[AD-A080748] N80-23323
An analytical means for determination of scoring limited load capacity in sliding/rolling contact
[AD-A080984] N80-23657

AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
Kwajalein reference atmospheres, 1979
[AD-A081780] N80-23915
Emission of particles from a charged sphere into a magnetic field
[AD-A081781] N80-24123

AIR FORCE HUMAN RESOURCES LAB., BROOKS AFB, TEX.
Platform motion contributions to simulator training effectiveness. Study 3: Interaction of motion with field-on-view
[AD-A078426] N80-23334

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.
Space transportation system western launch site construction management information system: A case study
[AD-A077675] N80-23358

AIR FORCE MATERIALS LAB., WRIGHT-PATTERSON AFB, OHIO.
Fatigue characterization of composite materials
[AD-A081320] N80-23372
Adhesive bonding experiments for titanium 6 aluminum 4 vanadium (Ti6Al4V). Part 1: Anodization treatments
[AD-A081538] N80-23432
Applications of generalized derivatives to viscoelasticity
[AD-A081131] N80-23686

AIR FORCE PACKAGING EVALUATION AGENCY, WRIGHT-PATTERSON AFB, OHIO.
Improved packaging for the LN-31 inertial measurement unit (F-15 aircraft)
[AD-A081745] N80-23293

AIRESEARCH MFG. CO., TORRANCE, CALIF.
High-temperature mechanical properties of sintered alpha silicon carbide (13 October 1978 - 13 October 1979)
[AD-A081824] N80-23375

AKRON UNIV., OHIO.
The role of chemical bonding in adhesion
[AD-A081661] N80-23462
Progressive settlements of foundations on cohesionless soils subjected to vertical vibratory loadings N80-23494

ALABAMA UNIV., HUNTSVILLE.
Data handbook for the National Solar Energy demonstration program
[DSE/5216-T3] N80-23815

ALABAMA UNIV. IN HUNTSVILLE.
Finite element analysis of subsonic, transonic and supersonic flows around missiles
[AD-A077375] N80-23261

AMERICAN UNIV., WASHINGTON, D. C.
Electro-oxidation of hydrogen and propane in strong organic acid electrolytes N80-23392

AMES LAB., IOWA.
Hydrogen embrittlement in vanadium single crystals
[ISM-249] N80-23441
Vortices in superconducting films
[ISM-258] N80-24195

AMSTERDAM UNIV. (NETHERLANDS).
Pointbars: A comparative examination along the large Dutch rivers
[REPT-2] N80-23760
Voorne-Putten: A landscape-ecological survey
[REPT-4] N80-23761

APPLIED PHYSICS LAB., JOHNS HOPKINS UNIV., LAUREL, MD.
The Magsat magnetometer boom N80-23517

ARGONNE NATIONAL LAB., ILL.
Superposition of alloy hardening, strain hardening, and dynamic recovery
[CONF-790601-6] N80-23436
Environmental assessment of the utilization of alcohol fuels in highway vehicle applications
[CONF-791009-19] N80-23477
Optimal design of compressed air energy storage systems
[CONF-791069-3] N80-23789
World Energy Data System (WENDS). Volume 6: International agreement profiles
[ANL-PMS-79-2-VOL-6] N80-23790
Open-cycle coal-fired liquid-metal MHD
[CONF-790640-7] N80-23844
Electric and hybrid vehicles in the urban future
[CONF-791009-23] N80-24217

ARIZONA UNIV., TUCSON.
Exploring new concepts for elucidating processes occurring in pyrotechnic flares and for generating aerosol dispersions
[AD-A080731] N80-23473
Dual-frequency Doppler-Lidar method of wind measurement
[AD-A080849] N80-23623
Coherent transient effect studies of Rydberg atoms
[AD-A081746] N80-24140
Optimum optical structures for active control
[AD-A080934] N80-24157
A high power inductively coupled plasma torch and impedance matching network
[AD-A080906] N80-24166

ARMS CONTROL AND DISARMAMENT AGENCY, WASHINGTON, D. C.
Synthesis of baryons from unconfined quarks
[ORO-3992-371] N80-24147

ARMY COMMUNICATIONS RESEARCH AND DEVELOPMENT COMMAND, FORT MONMOUTH, N. J.
A 3-5 heterostructure avalanche photodiode modules for fiber optic communication links in the 1.0 to 1.3 micrometer spectral range
[AD-A081185] N80-23539

ARMY ELECTRONICS TECHNOLOGY AND DEVICES LAB., FORT MONMOUTH, N. J.
Autoclave testing of plastic encapsulated 4001 CMOS integrated circuits
[AD-A081555] N80-23570

ARMY ENGINEER STUDIES CENTER, WASHINGTON, D. C.
Applications of digital display in photointerpretation and digital mapping
[AD-A081091] N80-23751
ARMY ENGINEER TOPOGRAPHIC LABS., FORT BELVOIR, VA.
Research for information extraction from aerial imagery
[AD-A080744] N80-23749
Digital screening and halftone techniques for raster processing
[AD-A081090] N80-23753
ARMY ENGINEER TOPOGRAPHIC LABS., WRIGHT-PATTERSON AFB, OHIO.
Planning of automated data acquisition and process control systems (ADACS)
[AD-A081043] N80-23994
ARMY ENGINEER WATERWAYS EXPERIMENT STATION, VICKSBURG, MISS.
Tensile crack exposure tests. Report 3: Laboratory evaluation of series A beams with results from 1951 to 1975
[AD-A081302] N80-23692
Remote sensing of aquatic plants
[AD-A081737] N80-23754
ARMY MISSILE AND MUNITIONS CENTER AND SCHOOL, REDSTONE ARSENAL, ALA.
Theory of disturbance-utilizing control with application to missile intercept problems
[AD-A081110] N80-23329
ARMY MISSILE COMMAND, REDSTONE ARSENAL, ALA.
A thermoplastic device for real-time in situ recording of acoustical holograms
[AD-A081011] N80-23624
Improving a real time acoustical holographic system for flaw detection
[AD-A080918] N80-23625
ATLANTIC RESEARCH CORP., ALEXANDRIA, VA.
Communications-electronic intrasystem electromagnetic interference measurement technique and instrumentation
[AD-A081830] N80-23537
ATMOSPHERIC SCIENCES OFFICE, WHITE SANDS MISSILE RANGE, N. MEX.
Atmospheric effects on millimeter radio waves
[AD-A081414] N80-23547
AUBURN UNIV., ALA.
A dynamically reconfigurable distributed computing system N80-23989
AVCO SYSTEMS DIV., WILMINGTON, MASS.
Hypersonic heat transfer test program in the VKI longshot facility
[AD-A081467] N80-23257

B

BADGER PLANTS, INC., CAMBRIDGE, MASS.
Conceptual design of a coal-to-methanol-to-gasoline commercial plant. Volume 3: Environmental
[FE-2416-43-VOL-3] N80-23485
BALLISTIC RESEARCH LABS., ABERDEEN PROVING GROUND, MD.
A numerical method to integrate Stiff systems of ordinary differential equations
[AD-A080998] N80-24063
BARRY CONTROLS, INC., WATERTOWN, MASS.
Computer programs: Shock and vibration isolation N80-23671
BATTELLE COLUMBUS LABS., OHIO.
Carbohydrate crops as a renewable resource for fuels production. Volume 1: Agricultural research
[BMI-2031-VOL-1] N80-23481
Analysis and design of a 100-kilowatt solar photovoltaic flat-panel power system for a machining and metalworking facility in Columbus, Ohio. Phase 1: Photovoltaic flat panel application experiment
[DOE/ET/23055-1] N80-23860
BATTELLE PACIFIC NORTHWEST LABS., RICHLAND, WASH.
Thermal energy storage in aquifiers: Preliminary information
[PNL-3062] N80-23793
Numerical analysis of temperature and flow effects in a dry, two-dimensional, porous-media reservoir used for compressed air energy storage
[PNL-304/] N80-23823
Solar reflector materials
[PNL-SA-7698] N80-23859
Evaluation of empirical atmospheric diffusion data
[NUREG-CR-0789] N80-23879
Mathematical models for atmospheric pollutants. Appendix C: Governing equations for atmospheric trace constituents and solution techniques
[EPRI-EA-1131-APP-C] N80-23880
Aerosol, trace elements and visibility measurements in mountainous terrain
[PNL-SA-7576] N80-23882
Mathematical models for atmospheric pollutants. Appendix D: Available air quality models
[EPRI-EA-1131-APP-D] N80-23884
Seismic data catalog and associated graphical capabilities
[PNL-2893] N80-23918
Wind characteristics for agricultural wind energy applications

A sound and complete Hoare-like system for a fragment of PASCAL
[MC-IW-97/78] N80-24022

A finite state lexical analyzer for the standard hardware representation of ALGOL 68
[MC-IW-98/78] N80-24023

An algorithm with ALGOL 60 program for the computation of the zeros of ordinary Bessel functions and of their derivatives
[MC-TW-179/78] N80-24024

Logical investigations on PTQ arising from programming requirements
[MC-ZW-117/78] N80-24025

A comparison of bounds of Delsarte and Lovasz
[MC-ZW-118/78] N80-24026

Some statistics on ALGOL 68 programs
[MC-IW-109/79] N80-24032

An algorithm for average costs denumerable state semi-Markov decision problems with applications to controlled production and queueing systems
[MC-BW-94/78] N80-24039

Generating all maximal independent sets: NP-hardness and polynomial-time algorithms
[MC-BW-87/78] N80-24068

A nonlinear vector finite difference scheme
[MC-BW-89/78] N80-24069

Non-stationary Markov decision problems with converging parameters
[MC-BW-90/78] N80-24070

Denumerables state semi-Markov decision processes with unbounded costs, average cost criterion
[MC-BW-92/78] N80-24071

Analysis of heuristics for sequencing jobs on one machine with release dates and delivery times
[MC-BW-95/78] N80-24072

One-step splitting methods formulated for semi-discrete parabolic equations
[MC-NW-55/78] N80-24073

Semi-discretization methods for partial differential equations on nonrectangular grids
[MC-NW-56/78] N80-24074

The application of iterated defect correction to the LOD method for parabolic equations
[MC-NW-58/78] N80-24075

On the stability of multistep formulas for Volterra integral equations of the second kind
[MC-NW-59/78] N80-24076

Error bounds for exponentially fitted Galerkin methods applied to stiff two-point boundary value problems
[MC-NW-62/78] N80-24077

On the stability of multistep formulas for systems of Volterra integro-differential equations
[MC-NW-63/78] N80-24078

Computations concerning the conjecture of Mertens
[MC-NW-64/78] N80-24079

Inequalities in discrete distributions
[MC-SW-56/78] N80-24080

A note on the median of the binomial distribution
[MC-SW-59/78] N80-24081

Nonuniformity of the convergence of location estimators
[MC-SW-60/78] N80-24082

Regression analysis for mixed cross-section and time-series data with references to some incomplete observations techniques
[MC-SW-61/78] N80-24083

The efficiency of three tests for linear hypotheses concerning two probabilities
[MC-SW-62/78] N80-24084

Jacobi functions: The addition formula and the positivity of the dual convolution structure
[MC-TW-177/78] N80-24085

A fractional integral operator corresponding to negative powers of a certain second order differential operator
[MC-TW-182/78] N80-24086

On a class of elliptic singular perturbations with applications in population genetics
[MC-TW-184/78] N80-24087

On the edge-coloring property for the hereditary closure of a complete uniform hypergraph 2
[MC-ZW-106/78] N80-24088

Vertex-critical subgraphs of Kneser-graphs
[MC-ZW-108/78] N80-24089

A lower bound for the length of partial transversals in a Latin square
[MC-ZW-109/78] N80-24090

Solution of two fractional packing problems of Lovasz
[MC-ZW-110/78] N80-24091

A lower bound for the permanents of certain (0,1)-matrices
[MC-ZW-111/78] N80-24092

Binary codes with minimum distance four
[MC-ZW-112/78] N80-24093

On the Diophantine equation 1k + 2k + ... + xk + R(x) = yz
[MC-ZW-113/78] N80-24094

A generalization of Decartes' rule
[MC-ZW-115/78] N80-24095

Interpolation for fragments of the propositional calculus
[MC-ZW-116/78] N80-24096

Stochastic filtering theory: A discussion of concepts, methods, and results
[MC-BW-96/78] N80-24109

Testing with replacement and the product limit estimator
[MC-SW-57/78] N80-24110

Bounds for the mean and standard deviation of linear combinations of order statistics
[MC-SW-58/78] N80-24111

Large deviations of multivariate-L-estimators with monotone weight functions
[MC-SW-63/78] N80-24112

Nonparametric estimation based on censored observations of a Markov renewal process
[MC-SW-64/78] N80-24113

An adaptive branching rule for the permutation flow-shop problem
[MC-BW-91/78] N80-24115

Deterministic production planning: Algorithms and complexity
[MC-BW-93/78] N80-24116

Run for your life. A note on the asymptotic speed of propagation of an epidemic
[MC-TW-176/78] N80-24117

Disjointness and quasifactors in topological dynamics
[MC-ZW-119/78] N80-24121

On a sufficient condition for the existence of G-compactifications

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

DEN3-61 ..... N80-16493

CONTRACT NUMBER — NASA ACCESSION NUMBER

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley

COLORADO
University of Colorado, Boulder

DISTRICT OF COLUMBIA
Library of Congress

GEORGIA
Georgia Institute of Technology, Atlanta

ILLINOIS
The John Crerar Library, Chicago

MASSACHUSETTS
Massachusetts Institute of Technology, Cambridge

MISSOURI
Linda Hall Library, Kansas City

NEW YORK
Columbia University, New York

OKLAHOMA
University of Oklahoma, Bizzell Library

PENNSYLVANIA
Carnegie Library of Pittsburgh

WASHINGTON
University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA
Los Angeles Public Library
San Diego Public Library

COLORADO
Denver Public Library

CONNECTICUT
Hartford Public Library

MARYLAND
Enoch Pratt Free Library, Baltimore

MASSACHUSETTS
Boston Public Library

MICHIGAN

Seattle Public Library

WISCONSIN
Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish, otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues and the cumulative index issues are available postpaid on subscription and in single copy from the Superintendent of Documents, United States Government Printing Office, Washington, D.C., 20402, United States of America.

Semimonthly issues

Annual subscription rates: $60.00 domestic; $75.00 foreign. Price per single copy: $2.50 domestic; $3.15 foreign.

Cumulative index issues, semiannual and annual

Annual subscription rates for both: $25.00 domestic; $31.25 foreign. Price per single copy: semiannual $9.50 domestic; $11.90 foreign; annual $16.00 domestic; $20.00 foreign.

Domestic subscription rates

Apply to the United States, Canada, Mexico, and all Central and South American countries, except as noted below.

Foreign subscription rates

Apply to Argentina, Brazil, French Guiana, Guyana, Surinam, Belize, and all other countries throughout the world.

Payment should be by check, money order, or document coupons, and must accompany order. Remittances from foreign countries should be made by international money order or draft on an American bank, payable to the Superintendent of Documents, or by UNESCO book coupons.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH
Scientific and Technical Aerospace Reports, Volume 18, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by Informatics Information Systems Company.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through June 30, 1981.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

Cumulative index volumes are published semiannually and annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

ON-GOING RESEARCH PROJECTS

By arrangement between NASA and the Smithsonian Science Information Exchange (SSIE), a separate section of information on aerospace-related *On-Going Research Projects* is inserted into each issue of *STAR*. The insert presents titles of active NASA grants and university contracts, summary portions of recently updated *NASA Research and Technology Objectives and Plans (RTOPs)*, and notices of non-NASA research projects that were funded in the most recent or current fiscal year. The latter are selected by SSIE. The project announcements in the insert are arranged by *STAR* divisions but are otherwise entirely separate from *STAR*. They are not indexed nor machine-searchable by NASA. Current and retrospective searches are available from SSIE, 1730 M Street, N.W., Washington, D.C. 20036.

SUBJECT SCOPE

Subject scope of *STAR*, *IAA*, and *On-Going Research Projects* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

HOW TO USE STAR SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 28:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $3.50 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($5.00 domestic; $10.00 foreign). Microfiche are sold at price code A01 ($3.50 domestic; $5.25 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;

2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF STAR ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue ahd other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $45.00 North America; $90.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

01 AERONAUTICS (GENERAL) 1931

02 AERODYNAMICS 1931
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.
For related information see also *34 Fluid Mechanics and Heat Transfer*.

03 AIR TRANSPORTATION AND SAFETY 1934
Includes passenger and cargo air transport operations; and aircraft accidents.
For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 1935
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.
For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 1936
Includes aircraft simulation technology.
For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION 1939
Includes cockpit and cabin display devices; and flight instruments.
For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 1939
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.
For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 1941
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 1943
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.
For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*.

12 ASTRONAUTICS (GENERAL) N.A.
For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS 1944
Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 1944
Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.
For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 1944
Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 1946
Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.
For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING 1946
Includes telemetry; space communications networks; astronavigation; and radio blackout.
For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE N.A.
Includes spacecraft thermal and environmental control; and attitude control.
For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION 1947
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 1947
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.
For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) 1948
Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS 1948
Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY 1951
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.
For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS 1955
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS 1959
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS 1962
Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.
For related information see also *Physics*.

31 ENGINEERING (GENERAL) 1968
Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS 1968
Includes land and global communications; communications theory; and optical communications.
For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING 1974
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.
For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER 1978
Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.
For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY 1981
Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.
For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS 1982
Includes parametric amplifiers.

37 MECHANICAL ENGINEERING 1985
Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 1987
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 1988
Includes structural element design and weight analysis; fatigue; and thermal stress.
For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.
For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) 1993

43 EARTH RESOURCES 1999

Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION 2001

Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION 2020

Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS 2024

Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.

For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY 2031

Includes weather forecasting and modification.

48 OCEANOGRAPHY 2036

Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) 2036

Includes genetics.

52 AEROSPACE MEDICINE 2037

Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES 2039

Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 2040

Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY N.A.

Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) N.A.

60 COMPUTER OPERATIONS AND HARDWARE 2041

Includes computer graphics and data processing.

For components see *33 Electronics and Electrical Engineering*.

61 COMPUTER PROGRAMMING AND SOFTWARE 2042

Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS 2044

Includes computer networks.

63 CYBERNETICS 2044

Includes feedback and control theory.

For related information see also *54 Man/System Technology and Life Support*.

64 NUMERICAL ANALYSIS 2046

Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 2050

Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS 2051

Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS 2052

Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

For related information see also *Engineering*.

70 PHYSICS (GENERAL) 2052

For geophysics see *46 Geophysics*. For astrophysics see *90 Astrophysics*. For solar physics see *92 Solar Physics*.

71 ACOUSTICS 2052
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution*.

72 ATOMIC AND MOLECULAR PHYSICS 2054
Includes atomic structure and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS 2056
Includes elementary and nuclear particles; and reactor theory.
For space radiation see *93 Space Radiation*.

74 OPTICS 2057
Includes light phenomena.

75 PLASMA PHYSICS 2059
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see *46 Geophysics*. For space plasmas see *90 Astrophysics*.

76 SOLID-STATE PHYSICS 2063
Includes superconductivity.
For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers*.

77 THERMODYNAMICS AND STATISTICAL PHYSICS 2065
Includes quantum mechanics; and Bose and Fermi statistics.
For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer*.

SOCIAL SCIENCES

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) N.A.
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT 2066
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE 2066
Includes information storage and retrieval technology; micrography; and library science.
For computer documentation see *61 Computer Programming and Software*.

83 ECONOMICS AND COST ANALYSIS 2067
Includes cost effectiveness studies.

84 LAW AND POLITICAL SCIENCE N.A.
Includes space law; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION 2068
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see *03 Air Transportation and Safety*, *16 Space Transportation*, and *44 Energy Production and Conversion*.

SPACE SCIENCES

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also *Geosciences*.

88 SPACE SCIENCES (GENERAL) N.A.

89 ASTRONOMY 2069
Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

90 ASTROPHYSICS 2070
Includes cosmology; and interstellar and interplanetary gases and dust.

91 LUNAR AND PLANETARY EXPLORATION N.A.
Includes planetology; and manned and unmanned flights.
For spacecraft design see *18 Spacecraft Design, Testing and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

92 SOLAR PHYSICS 2075
Includes solar activity, solar flares, solar radiation and sunspots.

93 SPACE RADIATION 2077
Includes cosmic radiation; and inner and outer earth's radiation belts.
For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

CSCL 01C

COSATI CODE

The aspects of flight testing an aeroelastically tailored forward swept research wing on a BQM-34F drone vehicle are examined. The geometry of a forward swept wing, which is incorporated into the BQM-34F to maintain satisfactory flight performance, stability, and control is defined. A preliminary design of the aeroelastically tailored forward swept wing is presented.

A.W.H.

ON-GOING RESEARCH PROJECTS

This is a listing of research projects - not publications

AERONAUTICS

Includes Aeronautics (general); Aerodynamics; Air Transportation and Safety; Aircraft Communications and Navigation; Aircraft Design, Testing, and Performance; Aircraft Instrumentation; Aircraft Propulsion and Power; Aircraft Stability and Control; and Research and Support Facilities (air). For Related Information See Also Astronautics.

1.0001, VARIABLE LOAD E/A CONCEPT

S.P. Desjarding, Simula Inc., *2223 S. 48th St., Tempe, Arizona* 85282 (DN081113; N62269-79-C-0241)

To investigate the feasibility of improving the operational performance of energy attenuator systems in crashworthy seats by incorporating a passively controlled variable limit load concept in their design. This contract supports work unit ZA601, Agency Accession No. DN681080.

A prototype variable limit load energy attenuator device will be designed, fabricated, tested and evaluated. Various load control mechanisms will be included in the evaluation.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0002, EFFECT OF FREE-STREAM TURBULENCE AND SURFACE ROUGHNESS ON BOUNDARY-LAYER TRANSITION

J.M. Kendall, U.S. National Aeronautics & Space Admin., Jet Propulsion Lab., *4800 Oak Grove Dr., Pasadena, California* 91103 (DF144080)

Designs of advanced aerospace vehicles require a better understanding of boundary-layer transition. Although many transition experiments have been conducted in past years, the phenomenon of boundary-layer transition remains poorly understood. The objective of this work is to provide experimental information which will enable application of stability theory to the prediction and interpretation of boundary-layer transition. Fundamental experiments such as these will provide new knowledge on the nature of transition and a more reliable means of predicting boundary-layer transition.

Through wind tunnel experiments the turbulence interaction efficiency throughout the important range of wave number and obliquity angle will be measured directly, using a new approach. The interaction results will be represented analytically and combined with stability theory to form a transition prediction method. Mean velocity profiles on a model with distributed roughness will be measured and represented analytically for the computation of stability results.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0003, ADVANCED ELECTRONIC FLIGHT CONTROL SYSTEMS DEVELOPMENT (INTEGRATED SENSORY SUBSYSTEM)

W.D. Weinstein, Grumman Aerospace Corp., *S. Oyster Bay Rd., Bethpage, New York* 11714 (DN081106; N62269-79-C-0206)

To develop an integrated and survivable configuration of inertial and air data flight control sensors suitable for digital flight control systems. This contract supports work unit ZA601, Agency Accession No. DN681080.

Synthesize and evaluate the operational capabilities of ISS integrated sensory subsystems and develop the asset advanced skewed sensory electronic triad accelerometer configurations.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0004, BICONIC AERODYNAMICS

D.S. Gillies, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF142900)

This work unit supports a SAMSO technology need for updated information on biconic reentry vehicles as well as tests planned at the AEDC wind tunnels on biconic designs. Biconic reentry vehicles would provide significant packaging and weight advantages over present sphere-cone designs. Technology on stability of biconics at reentry conditions will be advanced with completion of this study. The objective of this effort is to determine the aerodynamic properties of biconic configurations as a function of geometry for various angles of attack for reentry Mach and Reynolds number environments. This reentry environment simulation will improve ICBM capabilities and performance with the new design data and criteria obtained and will allow prediction of aerodynamic centers to within one percent of the vehicle length at reentry conditions.

Comprehensive experimental test program in the AFFDL 20-inch hypersonic wind tunnel varying biconic geometry and angles of attack over ICBM reentry Mach and Reynolds number conditions. Accompanying analysis to establish methods for accurate prediction of aerodynamic coefficients.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0005, DEPLOYABLE STABILIZATION AND RESTRAINT DEVICES FOR EJECTION SEATS

S.R. Mehaffie, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF144090)

This work unit will support the emergency escape and recovery of Air Force crew members from fighter aircraft. Current ejection seats are aerodynamically unstable, resulting in crew member injuries due to unrestrained limb flail and uncontrolled aerodynamic forces. The objective of this work effort is to determine the feasibility of deploying stabilizing surfaces on the ejection seat such as a nose and tail fairing. Additionally, an advanced crew member restraint system will be examined in order to control the limb flail problem. Successful demonstration of this concept will result in a capability for rapidly deploying pre-shaped crew escape system appendages which have potential for achieving the ejection seat stabilization and crew member restraint necessary to prevent serious injury or loss of life of the crew member during emergency escape.

The seat geometry is to be altered by the deployment of pre-shaped, foam-filled bags to act as nose, tail and advanced crew member restraint. This approach requires the development of a foam deployment technique capable of attaining fifty-millisecond operating time.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0006, PRELIMINARY DESIGN OF AIRCRAFT STRUCTURES
R.S. Sandhu, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143760)

To reduce the acquisition and maintenance costs and to insure a high degree of structural integrity and reliability of future Air Force weapon systems, it is imperative to develop reliable lightweight and low-cost airframe structures. The objective of this program is to develop new, low-cost structural concepts for Air Force weapons systems, and to enhance the capability of the preliminary design group in the areas of design-analysis techniques for the design and the evaluation of these concepts using advanced materials.

New structural concepts and arrangements using metallic, composites and hybrid materials will be designed, fabricated, and validated by tests resulting in an improved structural technology base.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0007, IMPROVED DATA MANAGEMENT SYSTEM
R.B. Philbrick, Bell Helicopter Textron, *Hwy. 183, P.O. Box 482, Fort Worth, Texas* 76101 (DA0E3867; DAAJ51 79 C 0015)

Develop an improved data analysis and management system known as DATA-MAP (data from aeromechanics' tests and analytics-management and analysis package, formerly known as OLS-DMS) to be used for interactive analysis and display of data resulting from flight, wind tunnel, or whirl tower tests, and for validation and evaluation of analytical methods. An end-result will be the capacity to analyze and display data for improving performance, stability and control, loads and vibrations, acoustics and aeroelastic stability.

Improve DATA-MAP (OLS-DMS version 2.01) by expanding and enhancing its graphics, analysis and operational capabilities in order to increase its versatility and usefulness as an engineering tool. A data file will be defined to simplify conversion of data formats and structures for input to DATA-MAP, thus facilitating direct comparison of test and simulation results and also providing for C-81 data display and analysis.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Applied Technology Lab.

1.0008, INTEGRAL THEORY OF IMPACT ANALYSIS
T. McDonough, U.S. Dept. of Defense, Defense Advanced Research Projects Agency, *1400 Wilson Blvd., Arlington, Virginia* 22209 (DF142980)

In the performance of many military missions the crew compartment transparent enclosure is exposed to various different threats. It is imperative that the crew compartment enclosure (windshield, canopy) provides maximum protection against ballistic threats. This program will analytically analyze transparencies for resistance to ballistic impacts and will determine design methodology to maximize transparencies for survivability against ballistic threats while minimizing the associated costs, weights, thicknesses, etc. By obtaining a capability to analytically determine an optimum windshield design, instead of the current cut and try techniques, the assets required to arrive at a final windshield design should be substantially reduced.

Aeronautical Research Associates of Princeton (ARAP) has developed an integral theory of impact which offers the potential capability to predict material response to ballistic threats. ARAP will predict the ballistic limit of an existing multi-laminate aircraft windshield. If the theory proves successful, ARAP will then design a windshield specimen optimized for performance against a ballistic threat while remaining within specified weight, cost and thickness parameters. That windshield specimen will then be fabricated and tested and if acceptable levels of correlation are obtained, remaining funds will be used to develop the theory to handle additional variables (yaw, obliquity and projectile shapes).

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0009, AN ADAPTIVE CONTROLLER FOR AN AIRCRAFT GAS TURBINE PROPULSION SYSTEM
R.G. Leonard, Virginia Polytechnic Inst. & State University, Graduate School, *Blacksburg, Virginia* 24061 (NSG 3275)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Lewis Research Center

CHEMISTRY AND MATERIALS

Includes Chemistry and Materials (general); Composite Materials; Inorganic and Physical Chemistry; Metallic Materials; Nonmetallic Materials; and Propellants and Fuels.

3.0001, INVESTIGATION OF THE CNTD MECHANISM AND PROPERTIES OF SIC AND ALN DEPOSITION
R.A. Holzl, Chemetel Corp., *Pacoima, California* 91331 (DF054420; F49620-79-C-0041)

AF function - ceramic materials are being developed for a variety of components (e.g., blades, vanes, combustors, bearings and seals) in future gas turbine engines and for a variety of electronic and optical components in aircraft. Opportunity - a new CVD-like process known as CNTD (controlled nucleation thermochemical deposition) has been developed for producing very fine-grained materials having superior mechanical properties. Objective - the objective of this research is to study the mechanism and deposition parameters of CNTD for fine-grained high strength silicon carbide and aluminum nitride. How work contributes - silicon carbide deposits will be further evaluated by the Air Force for strength, toughness and corrosion resistance for possible impact on the Ceramic Turbine Engine Program. Silicon nitride samples will be further characterized for optical, dielectric and thermal properties under concurrent AFOSR research contracts.

The optimum deposition parameters for CNTD will be established to produce fine-grain, high strength SiC and AlN. Microstructure and mechanical testing data will be used in an iterative development cycle for optimizing the process. Variables to be studied include gas chemistry, gas pre-heat, gas flow, partial and total pressure, substrate temperature, methods of heating and geometry of the sample and deposition system.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0002, ENERGY TRANSFER PROCESSES AND COHERENCE IN CONDENSED PHASE
C.B. Harris, University of California, Berkeley Campus, School of Letters & Science, Dept. of Chemistry, *Berkeley, California* 94720 (CHE77-14667 A01)

Dr. Harris will investigate the properties of solids and liquids which are important and responsible for rapid electronic and vibrational energy transfer in condensed phases. He will develop new experimental approaches to the field utilizing the coherent properties of applied magnetic (microwave) and electric (laser) fields. In addition, he will develop the theoretical basis for the investigations. This theory is applicable in a general way to many different types of spectroscopy. Finally, he will investigate the interrelationships between kinetic and statistical descriptions of energy transfer in condensed phases. This research represents a continuation of that currently supported by Foundation grant CHE-7420707.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0003, TITANIUM COATING IGNITION TEST
Unknown, United Technologies Corp., Pratt & Whitney Aircraft Group, *P.O. Box 2691, West Palm Beach, Florida* 33402 (DF463340; F33615-79-C-2005)

To verify the effectiveness of titanium fire suppressant coatings developed in a materials technology program.

Test coated samples of titanium in a flow field of varying temperature, pressure and velocity. Samples will be ignited by melt impingement and/or high energy laser.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

3.0004, WEAPONRY - COMBUSTION OF NON-ALUMINIZED HETEROGENEOUS SOLID PROPELLANTS
W.C. Strahle, Georgia Inst. of Technology, School of Aerospace Engineering, Dept. of Aerospace Engineering, *Atlanta, Georgia* 30332 (DN223680; N00014-75-C-0332)

The objective of this work is to obtain quantitative understanding of the combustion of ammonium perchlorate–binder–ammonium perchlorate (AP) sandwich models in an effort to establish a predictive capability for the burn rate behavior of composite propellants. The research, hopefully, will contribute fundamental kinetic data on binder and oxidizer decomposition, and gas-phase, catalytic, and interface reactions all pertinent to cost-reduction aspects of propellant formulation and development for Navy missiles.

The investigation is aimed at acquisition of experimental data relevant to combustion of AP-binder sandwiches incorporating catalysts within the binder, oxidizer, or at the interface and extension of an analytical model to include several effects of importance. A combustion bomb, with burning up to 3200 psi, will be utilized with deflagration characteristics inferred through cinephotomicrography and quenched sample photomicrography.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

3.0005, HIGH DOSE ION IMPLANTATION OF ALUMINUM AND TITANIUM ALLOYS
J.R. Stevenson, Georgia Inst. of Technology, School of Physics, *225 North Ave. N.W., Atlanta, Georgia* 30332 (DF054110; AFOSR-79-0011)

AF function - corrosion due to the formation of oxides and nitrides limits the life-span of equipment and is both economically and militarily expensive. Deficiency - unexpected and catastrophic failure of metal components can occur where corrosion damage is undetected. Objective - to make beneficial changes to the surface chemical and physical properties by the use of ion implantation techniques. How work contributes - ion implantation is expected to improve such surface properties as hardness, friction, resistance to oxidation and corrosion without changing the bulk properties of structural metal alloys.

Ion implantation is a technique which has evolved from electronic device fabrication. This research project will explore the possibilities of improving the mechanical, chemical and metallurgical surface properties by utilizing high doses (up to 10 to the 19th power ions incident per sq. cm of target area).

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0006, CHEMICAL APPLICATIONS OF RESONANCE RAMAN SPECTROSCOPY WITH TUNABLE LASERS
R.P. Van Duyne, Northwestern University, Evanston Campus, School of Arts & Sciences, Dept. of Chemistry, *633 Clark St., Evanston, Illinois* 60201 (CHE78-00877)

Dr. Van Duyne is studying the electronic structure of the ground and the excited states of radical ions as well as the nature of highly exothermic, nonadiabatic electron transfer reactions. In addition he is pursuing a series of investigations into the development of highly specific molecular probes for the monitoring of electrochemical processes and for the analytical characterization of low dimensionality, organic solids possessing unusual electronic properties. The main experimental technique being employed is resonance Raman spectroscopy (RRS). Tunable continuous wave (CW) as well as pulsed dye lasers are being used as the primary excitation sources. This work is a continuation of that currently supported by Foundation Grant, CHE-7412573.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0007, LONG RANGE MOLECULES
W.C. Stwalley, University of Iowa, School of Liberal Arts, Dept. of Chemistry, *Jessup Hall, Iowa City, Iowa* 52240 (CHE77-14681 A02)

Dr. Stwalley will investigate long range molecules, i.e., molecules (mainly diatomic) in their highest closely spaced vibrational-rotational levels near dissociation. These molecules have unique and exotic properties which, however, are often simply related to the long range behavior of the interaction potential (e.g., -C6R-6). The existence of such molecules has been conclusively established by electronic spectroscopy and independently by theoretical calculation. This research will involve spectroscopic studies (e.g., using a high-resolution tunable laser) principally of diatomic Li-containing molecules (e.g., the A1 sigma plus u state of Li2 where nearly half the vibrational states are predicted to be long range) with complementary theoretical studies as appropriate.

This research represents a continuation of that currently supported by Foundation grant CHE-74-13019.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0008, HIGH TEMPERATURE TURBINE ROTOR MATERIAL
Unknown, General Electric Co., *1000 Western Ave., West Lynn, Massachusetts* 01910 (DF463780; F33615-79-C-2043)

Investigate the use of carbon/carbon material in the turbine rotor of a small (500 to 1000 pounds thrust), 50-hour-life turbofan engine. The rotor will operate at 2500 degrees F and will not require any cooling air.

The basic contract will be a design study of a turbine rotor in a 2500 degrees F tit of a small turbofan and will also include a carbon/carbon material definition effort. Possible follow-on efforts include design, fabrication and test of a carbon/carbon turbine rotor.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

3.0009, SURFACE EFFECTS IN THE PLASTICITY OF CRYSTALLINE SOLIDS
R.M. Latanision, Massachusetts Inst. of Technology, School of Engineering, Dept. of Metallurgy & Materials Science, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DMR78-05935)

It is known that the mechanical behavior of a solid may be affected by conditions at its surface. In the case of semiconductors and insulators, the influence of variations in the space charge distribution on the mobility of dislocations has been proposed as an explanation for mechanical effects. The principal objective of the present program is to study the effect of changes in the space charge distribution on dislocation mobility about hardness impressions in cadmium sulfide surfaces exposed to sub-band-gap illumination in order to achieve the flat-band condition as determined by surface photovoltage spectroscopy. A singular feature of this program, particularly with respect to the role of surface charge, is the introduction of a surface analytical approach into an area that has been studied historically by essentially metallurgical methods. The microhardness and dislocation mobility (by etch putting techniques) will be determined for a variety of surface conditions. In addition the effect of adsorbed gases on surface mechanical behavior will be studied. Theoretical calculations of the forces between adjacent, like-charged dislocations will be performed to aid in the interpretation of experimental results.

This is a continuation of studies initiated under NSF grant DMR76-06854.

This is the first year of a three-year continuing grant.

3.0010, ENERGY PARTITIONING AND FLOW IN METAL-OXIDANT FLAMES
R.W. Field, Massachusetts Inst. of Technology, School of Science, Dept. of Chemistry, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (CHE78-18427)

This research is in the area of quantum chemistry. Dr. Field plans to carry out a three-faceted investigation of energy flow in alkaline earth plus oxidant flames. Its purpose is to de-

lineate and explain the most important channels for transfer of internal energy between electronic and chemical species. Particular attention will be focussed on the role of isolated-molecule spin-orbit and rotation-electronic perturbations in facilitating transfer of population between electron states. The three parts of this study are: (1) complete characterization of all so-called 'reservoir levels', as well as several high lying radiating states, by the technique of Optical-Optical Double Resonance (OODR) Spectroscopy; (2) detailed experimental and computer analysis of perturbations with the dual purpose of mapping the possible perturbation channels into, between, and out of the reservoir levels and establishment of quantitative relationships between populations and laser-induced fluorescence intensities; (3) selective pulsed preparation of individual reservoir levels by the technique of Stimulated Emission Pumping, combined with fluorescence and excitation spectroscopic population monitoring, to obtain state-to-state transfer rates and quantum efficiencies. This research represents a continuation of that currently supported by Foundation grant CHE7505959.

3.0011, EFFECT OF MOLECULAR STRUCTURE ON MESOMORPHIC BEHAVIOR

A.C. Griffin, University of Southern Mississippi, School of Science & Technology, Dept. of Chemistry, *Hattiesburg, Mississippi* 39401 (DMR7805284)

Liquid crystals can flow like liquids, but have some of the molecular ordering of solids. The changes of this ordering and of the optical properties with temperature or applied field are the basis of using liquid crystals in, say, the familiar digital thermometers or display devices. The goal of Professor Griffin's work is to examine how the tendency of the liquid crystal phases to undergo transitions is affected by such chemical attributes of the constituent molecules as dipole interactions, polarity, size, and ability to hydrogen bond. The long range goal of this work is to enable the synthetic chemist to tailor make a system with desired transition temperature and optical properties. A correlation between molecular structure (electronic and steric factors) and smectic properties is to be established by preparing and examining binary mesophase systems. New smectic materials are synthesized as required. Experimental studies include (1) microscopic measurements of transition temperatures and phase identification; (2) thermal measurements of heats and temperatures of transition for selected pure compounds and binary systems using differential scanning calorimetry; (3) X-ray studies of structure when required by the uniqueness of the binary behavior.

This is the first year of a three-year continuing grant.

3.0012, LIGHT SCATTERING EFFECTS FOR AEROSOLS AND OTHER PARTICLE SYSTEMS

M. Kerker, Clarkson College of Technology, School of Science, Dept. of Chemistry, *51 Main St., Potsdam, New York* 13676 (CHE77-13102)

This project will study a number of new light scattering effects, and the application of these effects to study the size, composition and internal structure of particulate systems. Examples are aerosols, hydrosols, and biological cells.

When Raman or fluorescent scattering signals are used to probe for molecular species in aerosols or biological cells, significant errors will occur unless the effect of particle size and shape is considered. Numerical and experimental studies will be carried out to elucidate the effect quantitatively.

When light is absorbed by a particle, the particle may be heated. The effect of this heating on particle motion will be studied. Configurations of particles which have abnormally low scattering cross-sections (nearly invisible particles) have been discovered. Similar effects for absorbing particles will be investigated.

An integral equation formulation to permit effective calculation of scattering from particles with internal structure will be developed.

This research is a continuation of that currently supported by Foundation Grant, CHE-7403910.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0013, PHASE RELATIONS AND ELECTRON-ELECTRON INTERACTIONS IN THE SYSTEM LITHIUM-METHYLAMINE

M.J. Sienko, Cornell University, Ithaca Campus, School of Arts & Sciences, Dept. of Chemistry, *Ithaca, New York* 14850 (CHE78-12238)

This research project is in the area of chemical thermodynamics, in the subfield of phase equilibria. The system lithium-methylamine will be examined for its electric, magnetic, and magnetic resonance behavior over the concentration range from 0 to 30 moles percent metal, and over the temperature range from 4 degrees K to 300 degrees K. Special attention will be given to the region of the metal-nonmetal transition, and its relation to liquid-liquid coexistence, and 'expanded-metal' compound formation. Electron spin resonance, electrical conductivity, nuclear magnetic resonance, and X-ray and neutron diffraction are among the experimental methods which will be applied. The results will be of interest for the analysis of electron-electron interactions and the metal-insulator transition, especially for disordered systems.

This research is a continuation of that currently supported by Foundation Grant, CHE-7421480.

SUPPORTED BY U.S. National Science Foundation,

3.0014, STABILIZED SKIN STUDIES

M. Plummer, Grumman Aerospace Corp., *S. Oyster Bay Rd., Bethpage, New York* 11714 (DF142070; F33615-78-C-3215)

Performance requirements of advanced military aircraft indicate the desirability of using titanium as a major structural material to achieve the necessary strength-to-weight fraction, thermal capability, or both. The high cost of both the material and conventional primary production processes makes acquisition costs for titanium structural hardware non-competitive with more conventional materials. The objective of this effort is to define design options utilizing advanced titanium construction methods which allow more efficient use of material and production innovations. A goal of 25 percent or more acquisition cost-reduction with no sacrifice of structural weight, integrity, or life is required.

A number of stabilized skin panels utilizing superplastic forming and diffusion bonding will be designed to satisfy realistic type design criteria. They will be fabricated and tested. The results will be analyzed, tabulated, and compared with the best existing design technologies presently in production use.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

3.0015, INTERACTIVE EFFECTS BETWEEN TRANSITION METAL IONS IN OXIDE GLASSES

R.K. MacCrone, Rensselaer Polytechnic Inst., School of Engineering, Dept. of Materials Engineering, *110 8th St., Troy, New York* 12181 (DMR77-11322 A01)

Previous work using electric and magnetic susceptibility has estabished that in dilute concentrations (0-10 moles percent), transition metal ions form ordered complexes in oxide glasses. Further investigation into these complexes will be accomplished using the techniques of mixed valence charge transfer optical absorption and electron paramagnetic resonance. The objectives will be to understand how the chemical composition of the host glass and the valence concentration ratio of the contained transition metal ions affect the glass structures.

Mixed valance charge transfer optical absorption will be used as a tool to study the formation of transition metal ion complexes as a function of transition metal ion concentration, transition metal ion type, valence concentration ratio, host glass composition and thermal history. At the same time the physics

of the absorption bands will be studied to investigate the phonon and exchange interaction.

Electron paramagnetic resonance measurements will be used on selected glasses as complementary techniques to study the transition metal ion complex structure through the antiferromagnetic coupling effects of the exchange integral. The temperature dependence of the resonance in selected glasses, subjected to the experimental variables above, will be measured and compared to the behavior expected of specific structural models.

This is a continuation of NSF Grant DMR77-11322.

3.0016, PREBIOTIC SYNTHESIS - BIOMOLECULES FROM HCN

J.P. Ferris, Rensselaer Polytechnic Inst., School of Science, Dept. of Chemistry, *110 8th, Troy, New York* 12181 (CHE76-11000 A02)

The isolation of orotic acid by the hydrolysis of the HCN oligomers suggests that pyrimidines and pyrimidine derivatives may have been formed from HCN on the primitive earth. The conversion of orotic acid to uracil and orotidine as part of the further investigation of this prebiotic pathway to pyrimidine nucleosides is being investigated. The decarboxylation of orotic acid is being attempted in the presence of anions which may have existed on the primitive earth. The investigation of the synthesis of orotodine starts with a study of the reactions of alkali metal and transition metal salts or orotic acid with a bromoribose derivative. When the factors which control orotidine synthesis are more clearly understood the reaction will be studied using a prebiotic ribose derivative. The investigation of the products formed by the hydrolysis of the HCN oligomers to see if other classes of biomolecules besides purines, pyrimidines and amino acids are formed is being continued. The pathway for the oligomerization is being probed using carbon-14 labelled and N-alkyl derivatives of diaminomaleonitrile. The effect of clay on the oligomerization of HCN and peptide bond formation mediated by HCN oligomers is being investigated. This work is a continuation of that currently supported by Foundation grant, GP-40080X.

3.0018, PLASTIC DEFORMATION BEHAVIOR OF SINGLE-CRYSTAL ALUMINA (NON-BASAL SLIP)

R.E. Tressler, Pennsylvania State University, University Park Campus, School of Liberal Arts, Dept. of Materials Science, *110 Sparks Bldg., University Park, Pennsylvania* 16802 (DMR76-83412 A01)

Research will be continued on the study of the plastic deformation dynamics and dislocation substructures of C- and A-axis sapphire deformed by pyramidal and prismatic slip, respectively. The results of differential strain-rate and differential temperature tests and detailed substructure evaluation as a function of the deformation parameters (strain, strain rate, and temperature) will be used to determine the rate-controlling mechanism(s) of deformation via these non-basal slip systems in undoped sapphire. The investigation of solute (Cr3 ion, Ti3 ion, Ti4 ion, and Mg2 ion) effects and precipitate effects (Ti4 ion-rich precipitates) on the yielding and flow behavior and the dislocation substructures will be continued. The results of this program will add to the fundamental understanding of the non-basal dislocation behavior in sapphire and elucidate the reason for the insensitivity of the deformation behavior to solutes and precipitates in these non-basal slip modes.

Ultimately, with the fund of published knowledge on basal slip and the information from this program, the plastic flow behavior of sapphire in uniaxial stress states can be mapped out as a function of orientation, strain rate, and temperature.

This is a continuation of research initiated under NSF Grant DMR-74-14118.

SUPPORTED BY U.S. National Science Foundation,

3.0019, RESEARCH ON HIGH DENSITY DIAMANTANE FUELS

A. Schneider, Suntech Inc., *P.O. Box 1135, Marcus Hook, Pennsylvania* 19061 (DF462920; F33615-78-C-2037)

The objective of this program is to develop high energy density liquid and solid hydrocarbon propellants based on the structures of diamantane and triamantane.

This program involves the laboratory syntheses of potential high energy density hydrocarbon propellants based on the structures of diamantane and triamantane. The contractor will measure and report the physical properties of all new compounds, and will supply experimental samples to the government.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

3.0020, SIGMA-PI REARRANGEMENT IN TRANSITION METAL COMPLEXES

M. Tsutsui, Texas A & M University, College Station Campus, School of Science, Dept. of Chemistry, *College Station, Texas* 77843 (A-420)

The results obtained by the studies on 'Sigma-pi Equilibria in Transition Metal Complexes' during recent few years have led us to explore broader and more general fundamental areas of transition metal complexes such as the nature of bonding and 4f and 5f elements. The X-ray diffraction analysis and X-ray photo-electron spectroscopy (ESCA) of organic derivatives of 5f elements (uranium and thorium) have revealed strong evidence of covalency in their bonding.

The two 'shake-up' satellite photopeaks observed in the U(4f) spectra probably arise from electron charge-transfer from molecular orbitals of both metal and ligand character to the corresponding anti-bonding molecular orbitals.

Satellite structures of Ln 3d5/2 photoelectron lines have been investigated for a number of diphthalocyaninatolanthanide (III) and -actinide (IV) complexes. Ligand yields shake-up satellites were not observed in Pr, Nd, and Gd complexes, while La, Ce, Th, and U complexes showed strong shake-up peaks. A new interpretation is put forward to explain the sharp variation in intensity observed throughout the lanthanide and actinide series.

3.0021, COMBUSTION MODELING OF SOLID PROPELLANTS

M.W. Beckstead, Brigham Young University, School of Engineering Science & Technology, Dept. of Chemical Engineering, *B-166 A S B, Provo, Utah* 84601 (DF054900; AFOSR-79-0100)

AF function - nearly all future Air Force rocket propulsion systems will use solid propellants. Deficiency - current analytical and experimental techniques are inadequate for accurate prediction and assessment of the combustion characteristics of these propellants. Objective - the objective of this research is to advance knowledge in four areas needed to understand the combustion of solid rocket propellants. These areas include diffusion flame analysis, aluminum combustion effects in double base propellants, catalyst effects in composite propellants and distributed combustion effects on propellant response function calculations. How work contributes - the results of this work will provide information needed to improve current analytical and experimental tools for predicting propellant steady and nonsteady combustion behavior and rocket motor performance.

An oxygen-methane diffusion flame burner will be built and used to collect data to assess various assumptions currently em-

ployed in application of the Burke-Schumann flame analysis to solid propellant combustion. A version of the BDP model, modified to account for double base binders, will be extended to treat aluminized propellants by incorporating a model for aluminum agglomeration. The resulting combustion model will be evaluated by examining predicted effects on burn rate, exponent, temperature sensitivity and combustion response. A version of the BDP model, modified to treat the effects of catalysts, will be evaluated against data currently available on catalyst effects on propellant combustion behavior. An aluminum agglomeration model will also be coupled to an acoustic calculation to examine distributed combustion effects on propellant response characteristics by comparing predictions with T-burner data. A steady-state model will also be evaluated in terms of its capability to predict propellant nonsteady response characteristics.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0022, MATERIALS SUPPORT TECHNOLOGY - CHARACTERIZATION OF ORGANIC MATERIALS

C.H. Wang, Utah Higher Education System, University of Utah, School of Science, Dept. of Chemistry, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (DN323116; N00014-75-C-0908)

Organic materials, such as polymeric coatings and lubricants, are in wide Navy use, and in order to predict their reliability under a variety of conditions, it is essential to understand their characteristics, and especially their breakdown mechanisms. It is proposed in this research to study the changes of physical properties of organic materials in the vicinity of transition points, such as glass transition temperatures, and to correlate changes in these materials with their molecular properties.

Low frequency intra- and intermolecular motions of molecules in solids, liquids, and liquid crystals will be studied, using an electric field-induced Raman scattering, Brillouin scattering and other techniques. These studies will be carried out under varying conditions of temperature to observe changes near transition points.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

3.0023, SOME ASPECTS OF FATIGUE CRACK CLOSURE IN ALPHA-BETA TITANIUM ALLOYS

C.J. Beevers, University of Birmingham, *P.O. Box 363, Birmingham, England, United Kingdom* (DF289790; AFOSR-79-0045)

AF function - research in improved, more reliable, lighter and longer lifetime air frame components. Deficiency - present methods of predicting the performance of titanium components are hindered by a lack of understanding of fatigue crack growth. Research - the aim of the proposed research is to understand the mechanics of fatigue crack growth, particularly the effects of fatigue crack closure in an alpha-beta titanium alloy. The work will consist of preparing, testing and analyzing the data from a series of one-inch-thick compact tension specimens tested over the growth rate range 10-4 to 10-2 mm/cycle and at an r ratio of 0.1. The crack extension will be monitored by optical, potential drop and compliance measurements simultaneously.

It is expected to answer the following questions: (1) What are the conditions under which fatigue crack closure occurs and what is the effect of load interaction on crack closure? (2) What is the magnitude of closure effect in terms of applied and effective stress intensity factors? (3) What is the crack growth rate relationship to both applied and effective stress intensity factors?

4.0002, SEARCH FOR STABLE ONE-DIMENSIONALLY CONFINED PLASMA CONFIGURATIONS

O. Buneman, Stanford University, School of Engineering, Dept of Electrical Engineering, *Stanford, California* 94305 (ENG78-01559)

The equilibrium properties of planar plasma configurations will be investigated from a theoretical and numerical point of view with the objective of determining those characteristics that result in stable configurations. Interest will focus on 'plywood' models in which current filaments in the plasma flow in different directions as one progresses through successive layers of the structure. Particular attention will be placed on the numerical methods. An effort will be made to reduce the computations needed to analyze particular structures. The analysis will include considerations of the effects of magnetic fields other than those arising from the current distribution and the effects of particles whose motion remains undetermined in the formulation.

This is a continuation of research previously supported under NSF grant ENG-7602402.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0003, RESONANT ABSORPTION AND PARAMETRIC DECAY INSTABILITIES IN LASER-GENERATED PLASMAS

P.W. Chan, Colorado State University, School of Engineering, Dept. of Electrical Engineering, *Fort Collins, Colorado* 80523 (ENG78-05894)

This program is an experimental investigation of anomalous heating of plasmas produced by irradiation of polysterene targets with carbon dioxide laser radiation. Plasma heating due to resonant absorption at oblique incidence and to the parametric decay instability are being investigated in detail. For the study of resonant absorption, the CO2 laser is split into two beams - one is used for plasma production and the other is used for plasma heating at different angles of incidence. The diagnostics include measurements of absorbed CO2 laser energy using an integrating sphere, measurement of electron and ion energy using a retarding potential energy analyzer, and determination of the spectra of resonant oscillation by incoherent scattering using a probing ruby laser beam. For the study of plasma heating via parametric decay instability, a single CO2 laser beam is used for plasma generation and heating. A probing ruby laser beam is used for scattering to observe the spectra of the electron-plasma and ion-acoustic lines. The frequency shifts of these lines can be used for positive identification of parametric decay instability. The line-widths give the damping rate and the line intensities (corresponding to growth rates), which are studied as functions of the incident laser power density. The absorbed laser energy, electron and ion energy are monitored as in the case of resonant absorption. In addition, temporal and spatial resolved holographic interferometry, Schlieren and shadowgram are employed to measure density, density scale length and electron temperature.

This is a continuation of research previously supported under NSF grant ENG-7418623.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0004, TWO-DIMENSIONAL HOLOGRAPHIC SCANNER INVESTIGATION

C.S. Ih, University of Delaware, School of Engineering, Dept. of Electrical Engineering, *Newark, Delaware* 19711 (ENG76-17987)

This research relates to the use of a single rotating multi-hologram system to provide a required two-dimensional scan automatically, and a simple means to dynamically stabilize the scanning beam. Analysis indicates that very high resolution (10 to the 7th power total resolution elements) could be achieved with scanners of moderate size and operating speed.

The program consists of analytical investigations and experimental demonstrations in the optical (visible) region. The main areas to be investigated include configurations and resolution, dynamic beam stabilization, multiplexing techniques, different wavelength operations, replication techniques, and static and dynamic demonstrations of hologram scanners. The results have application in infrared, millimeter, microwave, and ultrasonic imaging systems.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0005, FUEL DUMPING BY USAF A/C

H.J. Clewell, U.S. Dept. of Defense, Air Force, Engineering & Services Center, Engineering & Services Lab., *Tyndall Air Force Base, Panama City, Florida* 32403 (DF407170)

To assess the extent and environmental impact of fuel dumping by USAF aircraft, and to determine optimal procedures for minimizing any negative impact.

Extent of AF fuel dumping will be assessed by establishment of an AF-wide fuel dump reporting system and tabulation of reports. Physical behavior of the dumped fuel will be determined through wind tunnel modeling, computer simulation, and studies of actual dumps.

SUPPORTED BY U.S. Dept. of Defense, Engineering & Services Center, Engineering & Services Lab.

4.0006, CODING FOR MEMORY-LESS MULTIPLE-ACCESS CHANNELS

S. Lin, University of Hawaii System, Manoa Campus, School of Engineering, Dept. of Electrical Engineering, *Bachman Hall, Honolulu, Hawaii* 96822 (ENG78-05151)

Recent developments in satellite communication systems, computer communication networks and other communication systems involving multiple users require the investigation of the problem of the simultaneous transmission of information amongst several terminals over a common communication channel. Recent research results indicate that multiple users can communicate data with arbitrarily small probability-of-error over a common memory-less channel provided that the rates for the individual data streams lie within the capacity region for the channel.

This research program is concerned with coding for a special multiple user communication channel called the memory-less multiple access communication channel. The objectives of the research are: (1) to construct good (block or trellis) codes for the memory-less multiple access communication channel; and (2) to find practical methods for encoding and decoding these codes.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0007, DESIGN AND ANALYSIS OF PERIODIC SEQUENCES

M.B. Pursley, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Electrical Engineering, *207 Engineering Hall, Urbana, Illinois* 61801 (ENG78-06630)

There are a number of important electronic systems engineering problems which require sets of periodic sequences with good correlation properties. Examples include multiple-access communications, synchronization, ranging, tracking, multiple-terminal system identification, and communication via multipath channels. New techniques for the selection of sets of sequences with pre-specified correlation properties are needed to solve the signal design problems associated with such applications. In addition, new methods for the analysis of sequences and the evaluation of their key correlation parameters are required for system performance analysis. The analysis and design of sequences is the subject of this research investigation.

This action renews the research project presently supported under NSF Grant ENG75-22621.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0008, UNSTEADY TRANSONIC FLOW WITH HEAT ADDITION

M. Sichel, University of Michigan, Ann Arbor Campus, School of Engineering, Dept. of Aerospace Engineering, *Ann Arbor, Michigan* 48104 (ENG76-23982)

Two problems in unsteady transonic flow will be analyzed: 1) to explore the possibility of using similarity series to solve the transonic equations with heating accounting for the existence of shock waves or exothermic discontinuities; 2) to develop a dynamic model of oscillatory condensation for flow where the characteristic reaction or condensation time is much smaller than the characteristic unsteady flow time.

4.0009, CARRIER TRANSPORT IN HETEROJUNCTION DEVICES

E.S. Yang, Columbia University, School of Engineering & Applied Science, Dept. of Electrical Engineering, *Broadway & W. 116th St., New York, New York* 10027 (ENG78-19426)

Electronic properties of heterojunctions and heterostructure semiconductor devices are being investigated as part of an electronic device program. The special areas of research include (1) carrier transport in p-N and p-P heterojunctions, (2) carrier confinement and leakage, and (3) current-voltage characteristics of double-heterostructure devices. The work centers on device operating conditions dominated by radiative recombination effects and provides calculations and/or experimental observations of current-threshold and current-voltage properties of heterojunction structures. Experimental and theoretical work is being performed with devices fabricated in the Columbia University laboratory and with developmental devices available from industrial research organizations.

SUPPORTED BY U.S. National Science Foundation, Div. of Engineering

4.0010, MAGNETOELASTIC RAYLEIGH WAVES

G.L. Thomas, State University of New York, Stony Brook Campus, School of Engineering & Applied Science, Dept. of Electrical Engineering, *Stony Brook, New York* 11794 (ENG77-12151)

An experimental and theoretical study of magnetoelastic surface waves will be undertaken. The specific areas to be investigated include: (1) propagation characteristics of magnetoelastic Rayleigh waves (MERWs) for varying cuts of yttrium iron garnet (YIG) discs and films and varying propagative and bias field directions for frequencies extending to above one gigahertz; (2) the role played by magnetic domains in observed propagation and excitation properties of MERWs; (3) characteristics of recently observed magneto-acoustic volume-like modes in YIG discs and films; (4) tunability properties of MERW reso-

nators; and (5) design of MERWs on bulk substrates and thin films of strongly magnetostrictive rare earth-iron compounds.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0011, BACK-SCATTER/FORWARD-SCATTER/TERRAIN SCATTER RELATIONS

R.J. Papa, U.S. Dept. of Defense, Air Force, Rome Air Development Center, *Griffiss Air Force Base, Rome, New York* 13441 (DF904630)

AF function - surveillance. Deficiency/opportunity - existing surveillance radar systems have difficulty in estimating the height of low flying aircraft and do not optimize the overall performance capability of the radar. Objective - to predict radar multipath returns over a real earth from a causal relation between back scatter and forward scatter returns and other site-dependent data. Also, to improve existing multipath models for specular and diffuse scattering. How research contributes - improved multipath models will yield more accurate determination of the positions of aircraft and improve a radar system's performance in a more cost-effective fashion. The results of these investigations will be applied to several radar sites along the DEW line (project Seek Frost).

Utilize existing models of scattering from random, rough surfaces and correlate theoretical and computer models with experimental data. Types of terrain and sea states will be delineated for which an accurate theoretical model exists, capable of giving a causal relationship between the forward scattering (multipath) and back scatter (clutter). Theoretical and computer models will be extended to include the effects of terrain screening, shadowing and multiple scattering, and these models will be compared with experimental data taken under contract. The types of terrain to be investigated will be selected from several sites along the DEW line.

4.0015, HIGH SPEED INSTRUMENTATION FOR GENERATOR TEST FACILITY

E.J. Caputo, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF458970)

Complete the AFAPL generator test facility by providing a data acquisition and control system with the following capabilities: (1) sufficient acquisition speed to characterize aircraft electrical system transient performance, (2) storage of all performance-related test data, (3) short time playback and analysis capability, (4) complete automation, and (5) engine-start simulation.

Design system and procure and integrate all necessary components to accomplish objective. System will be composed at a MODCOMP II computer, a high density digital tape drive, 18 10-microsecond conversion A/D converters, and necessary interfacing and control circuitry. The MODCOMP II will be a satellite in the AFAPL computer network.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0016, TURBOMACHINERY FLUID MECHANICS

Wennerstrom, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF458780)

The objective of this task is to contribute to the aerodynamic technology required to design turbomachinery of low aspect ratio and high stage loading. This is fundamental to reducing the manufacturing and maintenance costs and improving the mechanical integrity of aircraft turbine engines.

The approach involves three parallel lines of effort: (a) analytical methods are being upgraded to include three-dimensional and time-unsteady effects, (b) data are being obtained through controlled experiments and advanced instrumentation, better defining three-dimensional and time-unsteady features of the turbomachinery gas path, and (c) design innovations such as splitter vanes, vortex generators for boundary-layer control, etc. are being experimentally evaluated.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0017, CATHODOLUMINESCENCE STUDIES OF AMPHOTERIC DOPANTS IN GAAS

Y.S. Park, U.S. Dept. of Defense, Air Force, Avionics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF117470)

The objective of this program is to attain a knowledge of the behavior of amphoteric dopants in epitaxial and semi-insulating GaAs with the goal of obtaining a better understanding of the thermal conversion of semi-insulating GaAs.

The work will utilize cathodoluminescence and Hall measurements as the principal techniques to analyze the characteristics of ion-implanted epitaxial and semi-insulating GaAs substrates. The behavior of amphoteric dopants such as Si or C will be studied by implantation into GaAs in order to elucidate the in- or out-diffusion mechanism and changes in the lattice location of amphoteric impurities. The effect of fabrication parameters on dopant type will be assessed. Samples will be prepared under differing implantation conditions in both semi-insulating GaAs and GaAs epi-layers. Parameters such as dose rate, target temperature, surface-encapsulants, and annealing conditions will be varied in preparation of the samples. Dual implantation will also be performed to determine conditions which produce N- or

P-type activity in GaAs. Comparison of luminescence results with Hall results should provide considerable insight into the effect of implant and annealing conditions on the behavior of amphoteric dopants implanted in GaAs.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Avionics Lab.

4.0018, TURBULENT FLOW RESEARCH
J.H. Lee, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143170)

Turbulence is an unsolved problem in fluid mechanics, yet one confronts it in many types of aerodynamic work. For this reason, a long-range research program has been instituted to understand the basic mechanics of turbulence and thereby develop new techniques that can be implemented to effectively solve the engineering type of shear flows such as turbulent jets and boundary-layer flows. A particular emphasis is placed on the aerodynamic/structural interaction problems in which the turbulent fluid motion brings about random excitation to part of the aircraft structure or the entire aircraft, thereby affecting the flight dynamics.

The rigorous treatment of turbulence involves analysis of the Navier-Stokes equations using statistical mechanics, random process techniques, stochastic simulation, and model approaches of constructing dynamic equations which share certain features of the Navier-Stokes equations. Probabilistic techniques are used to deal with the structural response excited by random aerodynamic fields. Important parameters are the statistical mean and variance, and power spectral density of the random variables.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

4.0019, ESTIMATION OF AERODYNAMIC FORCES AND MOMENTS FOR MISSILES
F.M. Sawyer, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF144530)

This work unit supports TP03, Flight Control, and specific goal FG04A2, Flight Control System Design Techniques. The problem area is the accurate determination of aerodynamic stability and control characteristics for missiles during the design phase. The objective is to systematically compare the results obtained from current missile computer programs with wind tunnel data for selected missile configurations. Results of this study will enable assessment of the accuracy of the various existing methods and will provide a basis for selection of the most promising approach for future program development.

Several existing computer programs will be used to predict the aerodynamic characteristics for circular and elliptical cross-section missile configurations. These results will be systematically compared with wind tunnel data to assess numerical accuracy. The computational techniques will also be compared to identify relative strengths and weaknesses.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

4.0020, INTERFACE HARDWARE DESIGN CONSTRUCTION AND MAINTENANCE
R. Trapani, Trapani Engineering Inc., *Berwyn, Pennsylvania* 19312 (DN081318; N62269-79-C-0059)

To design and construct various items of interface hardware for the Basic Configuration No. 1 laboratory effort. To provide maintenance support for various items of interface hardware.

To procure from the original manufacturer of several of GFE interface hardware the services and material necessary to perform above objective.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Communication Navigation Tech Directorate

4.0021, PHOTOREFRACTIVE PROCESSES FOR OPTICAL STORAGE AND DISPLAY
C.M. Kim, Rice University, School of Engineering, Dept. of Electrical Engineering, *6100 Main St., Houston, Texas* 77001 (ENG76-15006)

This program will examine holographic data storage and display in photorefractive materials. The thrust will be two-fold: (1) theoretical and experimental investigation of the physical processes and relevant crystal properties responsible for the photorefractive effect and the limitations imposed by them on desired device parameters, and (2) preparation of crystals with optimal properties and investigation of convenient techniques for the development of optical memory devices with predictable and desired characteristics. The crystals to be investigated include several transition metal-doped ferroelectrics. Characteristics of drift and photogenerated space charge fields in the crystals will be examined using holographic, photoelectronic, and chemical measurement techniques.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0022, SUMMER FACULTY FELLOWSHIP PROGRAM IN ENGINEERING SYSTEMS DESIGN
D.J. Norton, Texas A & M University, College Station Campus, School of Engineering, Dept. of Aerospace Engineering, *P.O. Box F E 44, College Station, Texas* 77843 (NGT 44-001-800)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Office of External Relations

4.0023, ION AND ELECTRON CYCLOTRON PLASMA WAVE STUDIES
J.E. Scharer, University of Wisconsin, Madison Campus, School of Engineering, Dept. of Electrical Engineering, *Madison, Wisconsin* 53706 (ENG75-19259 A01)

Theoretical and experimental studies of wave effects in magnetoplasmas will be conducted. The program will emphasize wave propagation and heating in the ion cyclotron range of frequencies and nonlinear processes excited by electron cyclotron waves. The objectives of the research are: 1) To obtain a solution to the fast Alfven wave mode conversion problem for multiple ion species plasmas and to assess potential advantages and disadvantages of this process for plasma heating. 2) To determine propagation characteristics and absorption processes for the mode-converted slow wave. 3) To examine the fast wave heating problem for larger Tokamaks where many eigenmodes exist within the absorption Q for a single eigenmode. 4) To conduct experiments to observe and model mode conversion and nonlinear electron cyclotron wave processes in a two-ion plasma.

This is a continuation of research previously supported under NSF grant ENG-7519259.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

GEOSCIENCES

Includes Geosciences (general); Earth Resources; Energy Production and Conversion; Environment Pollution; Geophysics; Meteorology and Climatology; and Oceanography. For Related Information See Also Space Sciences.

5.0001, SEASAT PROGRAM - USE OF SEASAT DATA TO INVESTIGATE CONNECTIONS BETWEEN SEA-SURFACE TEMPERATURES AND METEOROLOGICAL FACTORS
S.A. Bowling, University of Alaska, Fairbanks Campus, Geophysical Inst., *Fairbanks, Alaska* 99701 (7-925; MO-A01-78-00-4321)

OBJECTIVE: The use of SEASAT-A SMMR sea-surface temperature and wind speed data to examine the immediate effect of meteorological events, especially cyclone passages on sea-surface temperatures in the Gulf of Alaska/Aleutian area.

APPROACH: The SMMR data will be processed by differencing of temperatures obtained at different times to obtain

maps of cooling/heating rates, which will then be compared both with SMMR-derived wind speeds and with conventional meteorological data. Conventional meteorologial data will be used to select three periods during winter 1978-79, during fall, mid-winter and early spring. SMMR geophysical data tapes will be obtained during these periods, as well as IR imagery, if available. Major emphasis will be on patterns of temperature change relative to the positions of major meteorological features, and identification of those which are consistent enough to have a high probability of being real.

SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Environmental Satellite Service

5.0002, CARBON-14 FLUCTUATIONS IN THE ENVIRONMENT OF EARTH AND ATMOSPHERE
P.E. Damon, University of Arizona, School of Earth Sciences, Dept. of Geochemistry, *Tucson, Arizona* 85721 (EAR78-21813)

This is a continuation of NSF grant EAR74-13362 to continue investigations of 14C fluctuations and their causes. Long-term fluctuations in 14C production will be examined by analysis of the oldest bristlecone wood and other suitable material. Short-term 14C fluctuations of dated material from the Medieval Warm Epoch (AD 1150 to AD 1250) will be investigated to determine 14C atmospheric variations related to climate change. Previous analyses of bristlecone material that were significantly discordant with respect to adjacent material will be repeated. A model of the relationship between geomagnetic excursions, reversals plus other changes in the Earth's dipole moment, and 14C variations will be constructed. This will be used to calculate the effect of industrial additions of CO2 to the atmosphere. In addition, the work will evaluate relationships between 14C, climate and solar constant by study of the bristlecone data.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Earth Sciences

5.0003, MEASUREMENTS OF CONTINUOUS ABSORPTION BY ATMOSPHERIC TRANSMISSION CODES
D.E. Burch, Ford Aerospace & Communications Corp., *Ford Rd., Newport Beach, California* 92663 (DF582430; F19628-79-C-0041)

AF function - surveillance satellite, meteorological satellite. Deficiency - lack of knowledge of infrared absorption properties of the atmosphere. Objective - conduct laboratory measurements of water vapor and other atmospheric gases in the 20-30 micrometers, 2.7 micrometers, 6.3 micrometers and in the 3-5 micrometers and 10 micrometers window regions. How research contributes - atmospheric molecular absorption primarily by water vapor is being studied in order to provide fundamental spectroscopic data for inclusion in atmospheric transmission codes.

Laboratory measurements of absorption by various atmospheric gases with emphasis on the continuum or line wing component will be made in order to provide direct input data in the AFGL standard atmospheric transmission codes. Emphasis will be placed on the measurements and analysis in the spectral regions containing significant contributions from line wings or continuum absorption.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0004, DESIGN FABRICATION AND ENGINEERING SUPPORT OF ATTITUDE-CONTROL SYSTEMS
S.D. Lyon, Space Vector Corp., *Northridge, California* (DF248830; F19628-77-C-0251)

AF function - direct support of SAMSO infrared measurements program. Deficiency - lack of knowledge of rocket attitude-control and behavior. Objective - to provide the Air Force with a reliable, accurate, and low-cost attitude-control system (ACS) for ARIES sounding rockets. How research contributes - provides rocket-borne payloads with sufficiently accurate attitude-control for probing the infrared aerospace environment.

Develop and fabricate a state-of-the-art, highly accurate attitude-control system for the ARIES rocket.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0005, DEVELOPMENT OF INSTRUMENTATION FOR MONITORING CARBON FIBER EMISSIONS
S. Pollack, Thompson Ramo Wooldridge Inc., Defense & Space Systems Group, *1 Space Park, Redondo Beach, California* 90278 (68-02-3273; G712B-BE-021)

OBJECTIVE: The objective of the work is to develop prototype instrumentation for monitoring carbon fiber emissions.

APPROACH: Existing carbon fiber measuring equipment will be evaluated for application to continuous monitoring of carbon fiber emissions. Equipment(s) and modifications will be recommended for the monitor, and a prototype system will be fabricated and evaluated.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Sciences Research Lab.

5.0006, SIERRA CLOUD LIQUID
J. Snider, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Environmental Research Lab., *Boulder, Colorado* 80302 (RAA7 72 47)

PROJECT OBJECTIVE: To participate in sponsor's winter 1979-80 cloud seeding program. To obtain data to help assess ability of microwave radiometry to measure liquid water content in clouds.

CURRENT YEAR PLAN: Operate 28 GHz satellite receiver-radiometer during the December-February 1979-80 Sierra Cooperative Pilot Program at a location near Auburn, CA, to measure cloud liquid water content. Compare liquid measured by receiver-radiometer with data taken by probe-carrying aircraft.

SUPPORTED BY U.S. Dept. of the Interior, Water & Power Resources Service

5.0007, SEISMIC OBSERVATORIES
H. Whitcomb, U.S. Dept. of the Interior, Geological Survey, Branch of Global Seismology, *Box 25046, Denver Federal Center, Denver, Colorado* 80225 (9920-01193)

STATES/COUNTRIES TO WHICH PROJECT PERTAINS: Washington, Guam, Puerto Rico, Alaska.

The GS operates and maintains a national and world-wide network of observing and reporting systems. Included are facilities and systems for describing, mapping and charting the earth, utilizing seismological and geomagnetic science and technology, and conducting related research and development. Observatories supported by this project are located at Newport, Washington; Cayey, Puerto Rico; Agana, Guam; and Adak, Alaska. These observatories provide seismological data which are used to describe the occurrence of earthquakes and their effects on lives and property, and to monitor and record vibrations in the earth caused by earthquakes and large man-made disturbances. Also, observatories at Guam and Newport, Washington provide input on a 24-hour standby basis to the Tsunami Warning Service operated by NOAA in Honolulu. The data produced contribute to a better understanding of the earth's crust, mantle, and core, and of the nature of seismic hazards and risk. Magnetic data are used to update periodically regional and world magnetic charts, and to determine correction factors applicable to magnetic field measurements made by land, marine, and airborne magnetic survey parties. Additionally, this information supports studies in ionospheric physics, radio propagation phenomena, electrical conductivity, the composition of the core and mantle of the earth, and interplanetary space. Knowledge of magnetic declination and its secular change is required as input to the compilation of all sea and air navigation charts for use by marine and aircraft navigators and by public and private surveyors.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0008, ION MICROPROBE ANALYSES OF FELDSPARS AND UPPER-MANTLE MINERALS

J.V. Smith, University of Chicago, School of Physical Sciences, Dept. of Geophysical Sciences, *5734 S. Ellis Ave., c/o Hinds Geophysics Lab., Chicago, Illinois* 60637 (EAR77-27100)

This project concerns the continued development of ion microprobe trace element analyses and the application of these techniques to the analysis of peridotite nodules from kimberlites, kimberlite groundmass, and the analysis of lithium, beryllium and boron in feldspars.

The peridotites to be studied are the MARID (mica-amphibole-rutile-ilmenite-diopside) suites which have already been characterized in detail petrographically and analytically by electron microprobe for major elements and certain trace elements. This part of the study is of particular interest to the development of models for mag generation in the upper mantle.

Light element analysis will be performed on feldspars from a wide range of environments (authigenic, pegmatitic, granitic, and anorthositic) to determine elemental fractionation under varying conditions. Li, Be, and B are of particular interest because they cannot be determined by electron microprobe methods.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Earth Sciences

5.0009, REMOTE SENSING FOR SOIL SURVEY AND EROSION STUDIES

M.F. Baumgardner, Purdue University, Agricultural Experiment Station, Dept. of Agronomy, *Executive Bldg., West Lafayette, Indiana* 47907 (0008923; IND050020)

OBJECTIVE: Determine quantitatively the relationships between soil radiance and the physico-chemical properties of soils; delineate and map soil differences by digital analysis of multispectral data from air and spacecraft scanners; use digital analysis of multispectral data to prepare soil erosion maps.

APPROACH: The relationships between the radiance (-.48-2.40Mum) characteristics and numerous physical/chemical properties of a broad range of soils will be studied. Computer-implemented pattern recognition techniques, supplemented with field observations, will be used to analyze multispectral data from air and spacecraft scanners to delineate soil boundaries and map meaningful soil differences, including severity of erosion.

PROGRESS: The major long range goal of this research is the development of an advanced global information system for agriculture which integrates the new technologies of data acquisition, data analysis, and communications, or information dissemination. During the project period exploration of the information requirements of a global information system has continued. Specific research has been concentrated on defining quantitatively the relationships between soil reflectance and other physical/chemical properties of soils. This SCS-LARS cooperative research includes the study of duplicate samples of 250 major soil series selected to provide adequate statistical sampling from seventeen climatic regions of the U.S. Results of this study will make a significant contribution to the body of knowledge related to the contributions which different soil constituents make to soil spectral characteristics. With SCS participation, digital analysis of LANDSAT data has provided the principal data base for a detailed soil survey of Jasper County, Indiana. A false color image at a scale of 1:125,000 was used as a base map on which to delineate parent material boundaries. With these digitized boundaries overlaid onto LANDSAT spectral data, a soil map was produced spectrally at a scale of 1:15,840. A detailed description of each map unit has been prepared for publication with the spectral maps. This constitutes the first county to be mapped in detail using digital analysis of LANDSAT data.

SUPPORTED BY U.S. Dept. of Agriculture, Cooperative Research Office, Indiana

5.0010, OCEANOGRAPHIC INSTRUMENTATION - TESTING

E.M. Russin, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Ocean Survey, Office of Marine Technology, *Rockville, Maryland* 20852

TECHNICAL OBJECTIVE: To improve marine measurements made by NOAA and all sectors of the oceanographic community (private, academic, government) through a continuing research and development program of testing and evaluation of marine instrumentation. The program results are available through NOAA to the entire marine community.

APPROACH: Test and evaluate instruments used for the collection of physical, chemical, and biological data used for research and survey of the deep ocean, coastal waters, and estuaries. Maintain a laboratory to simulate the ocean environment. Analyze instrument failure modes for reliability assessment. Encourage the development of new sensors and testing techniques/methods unique to marine instruments and provide analysis of the quality for instrumental measurements. Disseminate results in comprehensive technical reports.

CURRENT PLANS: The FY '79 program includes providing lab/field performance and data quality information on marine instrumentation to measure water level, current speed and direction, conductivity, temperature, wave height and direction, water bottom depth, dissolved oxygen and nutrient-concentration to support NOS' involvement in the Tides and Tidal Currents Program, DOE's Strategic Petroleum Reserve Program, Wave Monitoring Project, Hydrographic Survey Systems, Ocean Dumping Program, and EPA's Pass-Thru Program. T&EL support is also planned for NOAA/NASA's Laser Hydrography experiments and OCEANAV/NORDA's T&E Program.

SUPPORTED BY U.S. Dept. of Commerce, National Ocean Survey, Office of Marine Technology

5.0011, ENERGETIC PROTON DELAY FROM SOLAR RADIO BURSTS

P.M. Bakshi, Boston College, Chestnut Hill Campus, School of Arts & Sciences, Dept. of Physics, *140 Commonwealth, Chestnut Hill, Massachusetts* 02167 (DF583490; F19628-79-C-0084)

AF function - communication and surveillance. Deficiency -capability of accurately predicting time of arrival of solar flare emitted particles does not exist. Objective - to investigate the delay of solar flare energetic particles by means of associated solar radio burst observations. How research contributes - will provide a knowledge of the delay characteristics of energetic solar flare particles to establish prediction techniques for the incidence of solar-related disruptive influences on HF communications, OTH radars, and satellite communication systems.

The correlation between solar radio bursts and the propagation of energetic particles from the sun to the earth will be studied by consideration of such parameters as the burst peak radio flux spectral width (W3/W2), the time development of the radio burst spectral shape, the flare/burst position on the sun, the flare/burst flash phase rise time, and the particle pitch angle distribution.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0012, INTERFEROGRAM DATA ACQUISITION SYSTEM FOR BALLOON-BORNE CRYOGENIC INTERFEROMETER

J.L. Pritchard, Idealab Inc., *Union St., Franklin, Massachusetts* 02038 (DF248480; F19628-77-C-0039)

AF function - surveillance, advanced infrared detection system. Deficiency - lack of high-resolution data of stratospheric emittance in infrared. Objective - to acquire and handle interferogram signal from cryogenically operated interferometer in balloon-borne environment. How research contributes - an instrument sensitive enough to measure stratospheric emission will be made ready for a balloon-borne operation.

A system for acquiring and handling an interferogram signal from a cryogenically operated high-resolution IR interferometer will be designed and fabricated. Tests for interfacing will be conducted to see whether the full sensitivity of the instrument will be achieved to insure a detection of the stratospheric emission for a proposed balloon-borne experiment.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0013, SCATHA INSTRUMENTS

B.F. Sellers, Panametrics Inc., *221 Crescent St., Waltham, Massachusetts* 02154 (DF242880; F19628-74-C-0217)

AF function - communications and reconnaissance. Deficiency -unknown cause of erratic system performance. Research - develop instrument to measure electron and proton fluxes in .05-300 keV energy range. How research contributes - this instrument will be used in the SCATHA satellite as one of a number of sensors intended to define the particle and field environment at synchronous orbit and its effect on satellite performance. It involves the design and testing of feasibility models and the fabrication of flight instruments and associated GSE. Instrument will feature maximization of information and minimization of weight, power requirements and telemetry demands.

The rapid-scan instruments designed for the SCATHA satellite must be shielded against energetic electrons. Appropriate electronic components are to be shielded as well as experimental testing of the detector response to background.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0014, RAPID SCAN PARTICLE DETECTOR DATA INTERPRETATION

B.F. Sellers, Panametrics Inc., *221 Crescent St., Waltham, Massachusetts* 02154 (DF582720; F19628-79-C-0099)

AF function - communication, navigation and command. Deficiency -the data base of the high energy plasma present at synchronous orbit is inadequate to accurately describe observed charging events or to properly relate them to their ultimate cause. Objective - to operate the rapid scan spectrometer at synchronous altitudes and interpret the data returned. How research contributes - data from the rapid scan spectrometer once analyzed and interpreted will provide increased understanding of the geosynchronous plasma environment and its role in spacecraft charging.

The rapid scan particle spectrometer will be operated at the geosynchronous orbit in conjunction with the other instruments on board the SCATHA satellite. The returned data will be analyzed and interpreted to provide definitive answers as to the plasma environment at the geosynchronous orbit as a function of geomagnetic activity, the effect of the plasma on spacecraft charging, and the response of the plasma to beam operations.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0015, SATELLITE DATA PROCESSING AND ANALYSIS

R.W. Fioretti, R D P Inc., *Waltham, Massachusetts* 02154 (DF247630; F19628-76-C-0244)

AF function - airborne surveillance, target acquisition. Deficiency - atmospheric density variations with time and space cannot be accurately predicted. Research - direct density measurements with satellite-borne accelerometers. Results are correlated with solar-geophysical parameters and other experiments. How research contributes -permits accurate determination of Air Force satellite ephemerides.

A SETA accelerometer is to be flown on Air Force satellites. This instrument permits high accuracy, high resolution atmospheric density measurements. Telemetry data from all the experiments will be provided on tape. The raw SETA data will consist mainly of drag accelerations which are proportional to density and accelerations due to vehicle motions caused by thrusting. Digital filtering methods are used to determine those accelerations due to drag. Density is calculated directly from the drag data. These results are used to accurately determine the orbit of the satellite. In addition, the density results are used to develop accurate atmospheric models.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0016, DEVELOP INSTRUMENTATION AND TECHNIQUES FOR STRATOSPHERIC ION COMPOSITION MEASUREMENTS

A.D. Bailey, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF581130)

AF function - military operations of supersonic aircraft and other vehicles in the stratosphere. Deficiency - the environmental effects of AF stratospheric operations cannot be accurately predicted for lack of knowledge of normal species concentrations and their spatial and temporal variations. Further, the mixing properties and chemical interactions of jet engines or missile effluents are only poorly defined. Objective - develop and flight-test a viable balloon-borne mass spectrometer system and techniques to determine the ionic composition and electrochemistry of the stratosphere, and conduct an initial measurements effect. How research contributes - ions may be effective sinks for pollutants by serving as condensation nuclei which could aglomerate stratospheric pollutants, forming aerosols which subsequently fall from the stratosphere into the troposphere to be washed out. Payoff could lessen restrictions on Air Force operations.

A cryo-pumped ion mass spectrometer will be designed and developed for balloon-borne measurements of positive and negative ions under both ambient and artificially excited conditions. Extensive laboratory evaluation testing will be conducted, including laboratory experiments with cluster ions to identify charge transfer reactions that alter the ion composition of the stratosphere. A theoretical study of ambient ion masses will be made to guide programming of the ion mass spectrometer measurements.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0017, LIDAR MEASUREMENTS OF ATMOSPHERIC DENSITY

D.E. Bedo, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF582840)

AF function - vehicle tracking, RV trajectory prediction, interception. Deficiency - insufficient information on a timely basis of the atmospheric density and variations in density at altitudes below 30 kilometers as is required for advanced reentry systems. Objective - the design, development and fabrication of a satellite-borne laser radar (LIDAR) system capable of providing near real-time remote density measurements at stratospheric altitudes and below. How research contributes - the satellite LIDAR system will probe the lower atmosphere and provide near real-time measurements of the atmospheric density at altitudes below 30 kilometers. Such data are of value to the Air Weather Service in support of strategic missile systems and in the development of low altitude density and weather prediction techniques.

The LIDAR system to be developed will be based on the detection of Rayleigh scattered laser light using a satellite-based transmitter and receiver. The hardened laser will be operated in a pulsed mode with power and repetition frequency determined by mission requirements and specific spacecraft capabilities. The LIDAR design will be compatible with an altitude resolution of one kilometer and absolute accuracy of better than 15 percent in the determination of density. Gating and timing circuitry will restrict the observations to altitudes below 30 kilometers. In addition to density determinations, the scattered signal will provide information on aerosol distributions within the probed regions and will allow deduction of the atmospheric transmission from the satellite to the ground.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0018, SHAPE AND STRESS ANALYSIS OF NATURAL SHAPE BALLOONS

J.F. Dwyer, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF582770)

AF function - advanced balloon system (surveillance, delivery, operations, environmental research support and space equipment test). Deficiency - procedures, adequate for the design of natural shape balloons and the analysis of critical off-

design load/altitude conditions, do not exist. Objective - a general computer code for the generation of natural shape balloon designs and the analysis of such balloons under representative flight conditions will be written and demonstrated for selected practical problems. How research contributes -this computer code will enable rapid evaluation of balloon requirements for proposed efforts including the advantages and disadvantages of system options. Further it will provide a means to evaluate proposed balloon design criteria changes.

A computer code written for the design of natural shape balloons, and using the Runge-Kutta numerical technique, will be modified to provide natural shape balloon designs based upon payload altitude and duration requirements. Rigging weight, recovery parachute weight, and ballast weight modelling codes will be included. The partially inflated ascent deployment configuration of natural shape balloon envelopes will be modelled using the Runge-Kutta or a finite difference method and the entire program tested on existing design shapes and a representative number of selected cases related to known operational problems.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0019, INSTRUMENTATION FOR DEKAMETRIC SOLAR-BURST-DISK LOCATION

D.N. Gaunt, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF580850)

AF function - communications and surveillance. Deficiency - at present, burst disk location, an essential element of geophysical prediction, is obtained solely from optical observations, which are sometimes obscured by weather. Objective - to develop the techniques and instrumentation for determining burst disk position from interferometric observations. How research contributes - determination of burst disk position and motion will be helpful in understanding the phenomena and in predicting the travel path of solar energetic particles toward the earth.

Produce a data processing system which will generate a continuous, real-time (seconds) measurement of the position of a radioactive area from data presently available from an existing sweep frequency interferometer. The technique used will measure the displacement of the phase difference of signals (received from the two antennas of the interferometer) from that of a theoretical signal from the center of the sun and convert this to angular displacement which will determine position.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0020, RAPID SCAN PARTICLE SPECTROMETER DATA ANALYSIS

D.A. Hardy, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF583220)

AF function - AF satellite systems operate at synchronous altitudes where charging can occur due to natural causes and may give rise to effects deleterious to the systems. Deficiency - the data base of the high energy plasma present at synchronous orbit is inadequate to accurately describe observed charging events or to properly relate them to their ultimate cause. Objective - to analyze and interpret data from the rapid scan particle spectrometer in conjunction with data from other experiments on the SCATHA satellite. How research contributes - data from the rapid scan particle spectrometer will provide specification of the geosynchronous plasma environment and its relationship to spacecraft charging.

The data from the rapid scan particle spectrometer will be analyzed to provide specification of the electron and ion characteristics at the orbit of the SCATHA satellite, to determine the relationship between the plasma characteristic and the degree of satellite charging, to provide input for the verification of spacecraft charging codes and to aid in the determination of active control methods for spacecraft charging.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0021, AUTOMATED AVIATION WEATHER PREDICTION

B.A. Kunkel, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF582990)

AF function - launch and recovery of military aircraft. Deficiency - lack of timely, automated methods of short range prediction of aviation-critical weather parameters. Objective - to investigate the characteristics of aviation-critical weather parameters such as slant range visibility, low-level wind shear and cloud base height, and to develop and evaluate statistically-based objective techniques which predict their behavior over periods ranging from 0 to 3 hours. How development contributes - the launch and recovery of military aircraft will be less hazardous and more effective, given improved predictions of aviation-critical weather parameters.

Weather data being gathered at the Otis AFB weather test facility (WTF) will be subjected to an extended analysis to determine the temporal and spatial characteristics of slant range visibility, as defined by a multiple sensor array of forward scatter meters (FSM) and transmissometers in a simulated landing zone and from remote towers. Using multivariate statistical methods, such as regression estimation of event probabilities, short range prediction experiments, initially carried out under task 667010, will be extended to consider the additive contribution of multiple FSM and transmissometer measurements. Consider the additive contribution of multiple FSM and transmissometer measurements. Cloud-base height observations will be gathered for a period of one year from an array of three automated rotating beam ceilometers (RBCs) located at the WTF and near an active runway at Otis AFB. An assessment of the representativeness of closely-spaced RBCs observations to automatically specify the required cloud parameters of total sky cover, cloud layer amounts and ceiling will be made. The development and testing of techniques of forecasting baseline cloud base height (or ceiling if appropriate) will be accomplished.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0022, TOP-SIDE IONOSPHERE MEASUREMENTS OF LOW ENERGY

R.C. Sagalyn, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF580770)

AF function - surveillance, communications, navigation and ionospheric modelling. Objective - develop instrument for monitoring ion and electron densities, temperature and scale height in the top-side ionosphere to be used as inputs for ionospheric models. How research contributes - permits improved space communications, frequency management and surveillance at HF and UHF frequencies.

The satellite experiments will be designed, fabricated, tested and integrated in the DMSP satellite. Software programs will be developed to operate on GWC UNIVAC for rapid transmittal to AWS Ionosphere Predictions Program.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0023, EVALUATION OF DMSP WATER VAPOR RADIANCES

F.R. Valovcin, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF583100)

AF function - weather observing, analysis and forecasting for military operations. Deficiency - inability to determine meteorological variables over inaccessible or unfriendly territory. Objective - to recommend operational techniques to derive moisture parameters from DMSP radiance measurements. How research contributes - water vapor obtained from satellite radiance measurements as input into AFGWC's Objective Analysis Program, cloud model, 3DNEPH and numerical forecasting model should provide an improvement in the analysis and forecasting of meteorological variables for AF tactical and strategic operations, weapons and surveillance systems.

DMSP water vapor radiances (emissions) will be correlated with ground truth measurements from polar to equatorial re-

gions and for different seasons. In addition, comparisons of calculations with observed water vapor radiances will be made. Progress - new in-house work unit.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0024, UV ELECTRON AND PROTON FLUX MEASUREMENTS IN THE AURORAL E LAYER

R.A. Van Tassel, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF584090)

AF function - trans-ionospheric ranging and communications, remote ionospheric monitoring. Deficiency - present state-of-the-art in relating natural optical emission to the electron density profile is not understood well enough to permit remote satellite monitoring of the auroral oval. Objective - in situ measurements with rockets of UV, electron and proton fluxes. How research contributes - provides direct measurements of atmospheric parameters to correlate with other measurements and computer codes being generated in the auroral E program.

The approach is to use sounding rockets to measure the following parameters in the auroral E layer - 1) electron flux and differential energy distributions from 1 eV to 20 keV, 2) proton flux and differential energy distributions from 5 keV to 60 keV, and 3) volume emission rates and total column emission rates from atomic oxygen at 5577 angstroms, 2972 angstroms and 1356 angstroms, from neutral nitrogen in the LBH bands and 2nd positive bands, from ionized nitrogen at 3914 angstroms, from hydrogen beta at 4861 angstroms, and from the nitrogen dioxide continuum around 5070 angstroms. All of the measurements will be made from a single rocket payload in the altitude range between 90 and 180 km.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0025, ALTITUDE PROFILE OF NEUTRAL THERMOSPHERIC COMPOSITION AND DYNAMICS

W.K. Vickery, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF248950)

AF function - operate missiles and satellites in and through the upper atmosphere. Opportunity - the DMSP supplementary sensor density package (SSD) requires calibration in order to assure accurate global measurements of atmospheric density. Objective - measure the density profile of major neutral atmospheric species with near-simultaneous measurements of the dynamical structure of the region between 90 and 180 kilometers. How research contributes - provides profile of major neutral species, turbopause altitude and thermospheric temperature profile needed as inputs for the calibration of the DMSP(SSD) package.

Each set of measurements involves two rocket payloads. One payload contains a specially designed neutral mass spectrometer to measure the density of each of the major atmospheric species. The other will dispense a vapor trail for dynamics measurements (including eddy diffusion coefficients, molecular diffusion and turbopause altitude data and temperature measurements). These measurements are combined with measurements of solar UV absorption, electron energy distribution and airglow radiation for a set of essential inputs to support the SSD calibration. The data are collected from the mass spectrometer by telemetry and reduced in terms of the neutral species distribution. Atmospheric dynamics parameters are determined from analysis of time-lapse photographs of vapor trails yielding wind, wind shear and temperature profiles, diffusion coefficients, and indirectly, total neutral density. Two sets of measurements are planned, one in FY79, a second in FY80.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0026, SIGNAL STATISTICS OF INTENSE SCINTILLATIONS

H.E. Whitney, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF580930)

AF function - satellite communications. Deficiency - inadequate knowledge of the effects of ionospheric scintillations on trans-ionospheric radio propagation. Objective - study the signal characteristics of intense scintillation and relate the effects of the propagation path to the performance of satellite communication systems. How research contributes - with a better knowledge of the degradation that can be expected on the communications path from scintillations, mitigating techniques can be implemented to improve the reliability of satellite communications.

The data recorded in Peru during October 1976 and March 1977 on intense scintillations will be computer-processed to provide the required signal statistics. Additional testing will be done in March 1978 to expand the data base on equatorial scintillations. Data from three closely spaced receiving sites will be used to determine the spatial correlation and the feasibility of space diversity for AFSATCOM. Power spectra from ground station data will be compared to aircraft data to determine the effects of the planes' velocity on the scintillation rate. The basic analysis for signal statistics was developed under in-house work unit 46430103 and the work unit is an extension of that effort.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0027, SATELLITE INSTRUMENTATION FOR HIGH ENERGY PARTICLES

G.K. Yates, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF580070)

AF function - navigation, communication and surveillance. Deficiency - inaccurate environmental specification for hardness of microelectronic components will result in insufficient criteria for military satellite systems. Objective - to design, test and calibrate high energy particle and magnetic flux detectors for satellite observations. How research contributes - direct measurement of the energetic particle environment in space will lead to a useful model resolving uncertainties in calculations of radiation hardening requirements.

Designs of state-of-the-art instruments for measuring high energy particles and magnetic flux will be completed. Fabricated instruments acquired under contractual work units supporting this task will be tested and calibrated in preparation for satellite integration.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0028, AEROSPACE PAYLOAD R & D

J.M. Otis, Wentworth Inst. of Technology, Undergraduate School, *550 Huntington Ave., Boston, Massachusetts* 02115 (DF583330; F19628-79-C-0103)

AF function - reconnaissance, surveillance, communication and advanced weapon systems. Deficiency or opportunity - inability to forecast atmospheric interactions affecting the design and operation of military systems such as re-entry vehicles, over-the-horizon radar and satellite operations. Objectives - (a) to perform research and engineering as required in the design, fabrication and test of aerospace payloads and sensors. (b) to redesign, fabricate, test and evaluate component assemblies of existing aerospace vehicles for the purpose of improving reliability and/or cost-effectiveness. How research contributes - the complexities of upper atmosphere and near-space in situ measurements demand state-of-the-art expertise if meaningful data are retrieved. Improved construction techniques and designs can only enhance reliability of experiments directly related to AFGL projects 2310, 6687, 6690, 7659, 7670, and SAMSO program 2123.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0029, ECOLOGICAL STUDIES AND MATHEMATICAL MODELING FOR THE CONTROL OF CLADOPHORA IN THE GREAT LAKES

R.P. Canale, University of Michigan, Ann Arbor Campus, School of Engineering, Dept. of Civil Engineering, *Ann Arbor, Michigan* 48104 (R806600; N769 -0049)

OBJECTIVE: Control the Cladophora problem in Lake Huron along the United States shoreline.

APPROACH: Determine effectiveness of alternate control strategies using mathematical models. Develop models using field and lab experiments. Obtain verification data under varying environmental conditions.

PROGRESS: Project is still in initiation phase. Field station established at Harbor Beach. Coordination achieved with NASA for over-flights.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Research Lab.

5.0030, ANTARCTIC SEA ICE

S.F. Ackley, U.S. Dept. of Defense, Army, Corps of Engineers, Cold Regions Research & Engineering Lab., *P.O. Box 282, Hanover, New Hampshire* 03755 (DPP77-24528)

The proposed work is a three-year project to describe sea ice conditions in Antarctica and their relationship to oceanic and atmospheric processes. Sea ice studies are incomplete without an accounting for their mechanics, thermodynamics, and structural and material properties, which form the bases of the proposed study. The Weddell Sea area has been chosen because of its unique role as a sea ice source and the impact of sea ice problems on other disciplines in this region, including meteorology, physical oceanography and biology.

The four objectives of this project are: (1) To obtain a drift-strain record from drifting buoys. These buoys will also provide meteorological information during the First GARP Global Experiment (FGGE). (2) To use the drift-strain record as a data source for the ice thickness distribution, and as a verification of energy flux estimates from satellite imagery. (3) To provide structural and material property information through a ship and helicopter-based ice drilling, coring, and remote sensing program. (4) To numerically model the sea ice circulation based on the results of the drifting buoy and ice structural experiments.

First-year activities will concentrate on preparations for deploying the buoy array during the 1978-79 field season.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Polar Programs

5.0031, MEASUREMENT OF PHYSICAL AND INSTITUTIONAL FACTORS FOR MANAGING ENVIRONMENTS ON RURAL LANDS

R.S. Freeburg, New Mexico State University, Las Cruces Campus, Agricultural Experiment Station, Dept. of Agricultural Engineering, *University Park, Las Cruces, New Mexico* 88003 (0072329; NM00609)

OBJECTIVE: Measure rates at which watershed characteristics change with development rates during the course of development of rural lands for recreation. Measure changes in water quality resulting from watershed characteristic changes. Assess patterns of development, considering institutional restraints, as to the expected effects on watershed characteristics.

APPROACH: Aerial photographs, in conjunction with information from the county assessor, city and county zoning, and county clerk offices, will be used to determine change in amount and distribution of impervious surfaces within several types of recreational developments. From among developments studied, at least one of each type will be studied in more detail, measuring runoff in major watercourses within developed area, Coliform counts in perennial streams and/or wells where these exist, sediment concentrations in perennial and ephemeral streams which are being influenced by construction activity, water table levels in those areas where water table is near the surface, precipitation. Several construction designs will be computer-simulated for the developments studied and tested, considering institutional restraints, to predict a range of effects to be expected from each development. It will also take into account physical restraints such as topography of land, soil, access, vegetation, etc.

PROGRESS: Monitoring of research sites is continuing. Measurements being made include: 1) inflow to developing sites, 2) outflow from developing sites, 3) rate of build-out on sites, 4) precipitation on sites. Preliminary evaluations of flood-routing patterns are being made to determine changes caused by land development. Results to date reveal rapid amelioration of runoff production in the developed areas in which road building and utility installation have been completed. Build-out rates have diminished in most developments. Land-use history of the development sites has been reviewed. Some of the environmental change due to development have been predicted on the basis of the site histories.

5.0032, MULTI-EXPERIMENTAL STUDIES OF THE WIND AND WAVE PATTERNS IN THE UPPER ATMOSPHERE AND IONOSPHERE

M.C. Kelley, Cornell University, Ithaca Campus, School of Engineering, Dept. of Electrical Engineering, *242 Carpenter Hall, Ithaca, New York* 14853 (ATM77-04518 A01)

This award provides continued funding for research under NSF grant ATM77-04518 and extends the duration by one year. The scientific objectives remain the same, with a modest shift in emphasis to take advantage of the Millstone Hill facility recently upgraded with NSF funds.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

5.0033, GAS CORRELATION FOR CARBON MONOXIDE

L.W. Chaney, U.S. Environmental Protection Agency, *Research Triangle Park, North Carolina* 27709 (DF336440)

To evaluate the capability of gas correlation spectroscopy for the remote (non-contact) sensing of carbon monoxide. Presently available point monitoring sensors have proven unreliable or inappropriate for determining the contribution of airfield operations to local environmental quality. A remote system would provide an integrated pollutant load.

Joint funding with EPA. Two existing systems will be evaluated by an independent party to determine their sensitivity, specificity, accuracy and reliability, and to recommend improvements.

SUPPORTED BY U.S. Dept. of Defense, Engineering & Services Center, Engineering & Services Lab.

5.0034, ELECTRO-OPTICAL TECHNIQUES FOR THE SAMPLING AND ANALYSIS OF AIR POLLUTANTS

W.F. Herget, U.S. Environmental Protection Agency, Office of Research & Development, Environmental Sciences Research Lab., *Research Triangle Park, North Carolina* 27711 (G712B-BA-006)

OBJECTIVE: Manage, administer, and conduct research on the application of electro-optical and electron optical instruments and systems for the measurement of pollutants emitted from stationary and mobile sources.

APPROACH: Remote sensing and extended-path techniques are applied for the identification of emitted gaseous pollutants. An electron microscope facility is maintained and applied for the characterization of particulate emission.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Sciences Research Lab.

5.0035, OHIO SOIL SURVEY

G. Hall, Ohio Agricultural Research & Development Center, *Wooster, Ohio* 44691 (0065341; OHO00450-S)

OBJECTIVE: Participate in Ohio Soil Survey program; explore and test new soil survey techniques; map soils on representative landscapes and characterize soil mapping limits; update soil survey on field research areas.

APPROACH: The cooperative program will be continued in the conduct of medium intensity soil surveys of new counties and old surveys will be evaluated as to their suitability for land use planning. Panchromatic and multispectral remote sensing techniques with surface mapping procedures will be tested as to

their feasibility for generalized and detailed mapping of soils in areas of different soil landscapes. Composition of soil mapping units and landscape features will be investigated. Soil surveys on field research areas will be reviewed and updated where needed.

PROGRESS: The Ohio Cooperative Soil Survey under the joint direction of the OARDC, ODNR Div. of Lands and Soils and USDA SCS has completed a modern land inventory of 4.5 of the 10.6 million hectares in the state (71%). During 1978 a total of slightly more than 0.4 million hectares of the state was mapped by field parties of the DLS and SCS. Soil survey field mapping has been completed in 51 of the 88 counties. Mapping is now in progress in 21 counties and a priority list established for the remaining 16 counties. Four counties in SE Ohio started progressive field mapping during the year: Perry, Scioto, Pike and Hocking. Cooperative soil survey reports for Greene, Miami and Portage counties were published during the year by USDA. Soil description and sampling for a soil drainability study to evaluate the effects of tile drainage on selected soils in NW and SW Ohio were completed during the year. This study, in cooperation with the OSU Dept. of Agricultural Engineering and the SCS, involved sampling the Clermont, Avonburg, Paulding, Latty and Roselms soils. Field studies in the Teays Valley area of Jackson Co. are being conducted by a graduate student in order to elucidate the origin of parent materials in the area.

SUPPORTED BY Ohio State Government

5.0036, PRECISE ESTIMATE OF THE EARTH'S GRAVITY FIELD

R. Rapp, Ohio State University Research Foundation, *1314 Kinnear Rd., Columbus, Ohio* 43212 (DF582570; F19628-79-C-0027)

AF function - study factors affecting precise determination of earth's gravity field. Deficiency - lack of suitable technical data for aerospace systems requiring precise gravity input. Objective - improved position determination and inertial alignment. How research contributes - provides technology to collect and interpret improved gravity data derived from currently inaccessible terrestrial areas.

Study global height reference systems by examining the unification of the various leveling networks that exist in the world today in order to see if it is feasible to develop a common gravity anomaly basis. Additionally, satellite altimetry data taken over land masses will be investigated to determine if it is practical to interpret such data for gravitational field improvement.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0037, LOWER THERMOSPHERE WINDS

W.B. Hanson, University of Texas, Dallas Campus, School of Natural Science & Mathematics, Dept. of Physics, *P.O. Box 688, Richardson, Texas* 75080 (DF583600; F19628-79-C-0113)

AF function - airborne surveillance, target acquisition. Deficiency - atmospheric density variations with time and space cannot be predicted with sufficient accuracy. Objective - direct measurement of neutral wind motions by satellite-borne accelerometers. Correlation of these results is made with other satellite data, including accelerometer density measurements, to develop improved atmospheric models. How research contributes - permits accurate determination of Air Force satellite ephemerides and development of accurate density forecasting techniques.

A satellite triaxial accelerometer system was flown on the Atmosphere Explorer-C satellite. Atmospheric density measurements have been derived from the two axes oriented to see large components of the force due to air drag. The third accelerometer axis was always nearly perpendicular to the air drag direction. Forces due to atmospheric winds along this axis may be determined. Separation of wind data from other forces acting on this axis is required. The other forces include those due to vehicle dynamics, motions of other instruments on the satellite and a small component of air drag if the accelerometer axis is not exactly orthogonal to the drag vector. This study will determine the accuracy with which neutral winds can be measured as a function of satellite altitude.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

LIFE SCIENCES

Includes Life Sciences (general); Aerospace Medicine; Behavioral Sciences; Man/system Technology and Life Support; and Planetary Biology.

6.0001, STRESS AND PERFORMANCE IN THE FLYING TRAINING ENVIRONMENT

Kvahenbaul, Arizona State University, Graduate School, *Tempe, Arizona* 85281 (DF224200; F33615-78-C-0053)

To investigate stress in the flying training environment with particular interest directed to stress of simulated flight and subsequent stress of airborne events. Experiments have been planned which (1) allow for quantification of stress experienced in various modes and phases of surface attack training, (2) help determine the interaction of instructor techniques and student stress, and (3) provide a clearer picture of the relationship between stress, learning and performance in surface attack training.

Three studies will examine: (1) physiological indices of stress in A-10 surface attack training, (2) the effect of IP teaching style on student stress, and (3) the effect of combat experience on stress response to simulated A-10 scenarios.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0002, ADVANCED FIGHTER RESEARCH PLANNING

W.L. Waag, U.S. Dept. of Defense, Air Force, Human Resources Lab., *Williams Air Force Base, Chandler, Arizona* 85224 (DF224280)

To define critical research issues which impact the design of advanced fighter training systems and to develop a plan which addresses these research issues using the modified capabilities of the ASPT. It is anticipated that the research program will focus on training syllabus development, performance measurement development, visual and force cue requirements, and instructor-operator station design requirements with emphasis on those features unique to the F16 aircraft.

A research team within FT shall be formed for the development of the research plan and shall take into consideration status of the F16 training system, projected ASPT capabilities and engineering development schedules, and user organizations requiring information which might be provided as a result of the research effort. Following formation of the research team and its orientation to the weapons system, user organizations shall be contacted for the purpose of identifying a potential set of research issues. From these data, a preliminary research plan shall be drafted and a planning conference hosted for their revision. Based on these revisions, the draft plan shall be forwarded to participating organizations for final review. The final plan shall become the basis of the research program to be accomplished using the ASPT.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0003, TACTICAL PERFORMANCE CHARACTERIZATION

L.J. Fogel, Decision Science Inc., *4901 Morena Blvd., San Diego, California* 92117 (DF228490; F33615-78-C-0011)

To develop advanced techniques for characterizing important aspects of tactical performance in flight simulators for display at the instructor/operator station (IOS). The work will include development and testing of methods for quantifying the value of importance assigned by students to various performance criteria and to the acquisition of various vantage points in the maneuvering envelope. This type of information, when displayed at the IOS, will provide valuable training data not otherwise available through conventional displays.

An adaptive maneuvering logic (AML) program has been developed to emulate the opponent in one-on-one tactical combat. The approach is to develop a modification of this pro-

gram which can compute the subjective weights assigned by a student to various short- and long-term performance goals or tactical objectives. The first phase of the study will be to develop and demonstrate the mechanics of the necessary computations - 9 MAC. The second phase, to be conducted only upon successful completion of the first phase, will include demonstration/refinement of the method using real pilot data recorded on the air combat maneuvering range - 15 MAC.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0004, AIRCRAFT OXYGEN GENERATION BY MEMBRANE PERMEATION

D. Johnson, Garrett Corp., *2525 W. 190th St., Torrance, California* 90509 (DF324890; F33615-79-C-0609)

This effort is to design, construct and test a staged gas permeation system to demonstrate the technical feasibility of producing aviator's breathing oxygen from aircraft engine bleed air.

The use of membrane gas permeators offers an alternative technology for on-board generation of breathing oxygen, which may offer the advantage of 100 percent contaminant-free oxygen coupled with a low aircraft power penalty. Various types of membranes will be investigated for oxygen permeation. Based on these data, a model system is to be constructed capable of delivering 20 liters/minute of 90 percent oxygen and to determine the effect of operating parameters such as feed pressure, temperature, and flow on oxygen concentrations. In addition, recommendations are to be included for up-grading the oxygen system to a prototype configuration which must provide 95 to 99 percent oxygen at flow rates up to 40 liters/minute.

SUPPORTED BY U.S. Dept. of Defense, Air Force, School of Aerospace Medicine

6.0005, WIND-BLAST PROTECTION CONCEPTS DEMONSTRATION

W. Adams, Rockwell International Corp., *International Airport, Los Angeles, California* (DF325420; F33615-79-C-0528)

Injury statistics from combat and non-combat emergency escape experience with USAF and USN ejection seats indicate that wind-blast injuries greatly degrade the effectiveness of these systems to provide safe recovery of aircrew. Injuries to the legs and arms present the most frequent serious problem. The objective of this research effort is to develop and demonstrate by limited testing the feasibility of limb protection concepts that are suitable for use with current in-service ejection seats. Resulting aeromedical design criteria and data will be provided to the Aeronautical Systems Division for further development and testing, and introduction of the final wind-blast protection equipment into operational usage.

This research effort encompasses: 1. exploratory development of new wind-blast protection techniques and equipment configurations, 2. demonstration of protective equipment concepts by laboratory tests, and 3. the development of aeromedical design criteria for wind-blast protection systems. To assure applicability of the research effort, the ACES II ejection seat will be used as the baseline seat design for this study. The protective system design will be compatible with the general installation requirements of the A-10, F-15, F-16 and their two-seat configurations. Consideration of designs from Air Force contract F33615-78-C-0514 will be given greatest emphasis. The research effort will be coordinated with the ASD Life Support Systems program office and aircraft program offices to assure that the design data and criteria that are developed can be successfully transitioned into protective equipment hardware development programs that will meet operational user needs.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab.

6.0006, DYNAMICS OF AIRCRAFT ACCIDENT VICTIMS - COMPUTER SIMULATION

J.M. Ballo, U.S. Dept. of Defense, Armed Forces Inst. of Pathology, *c/o Walter Reed Medical Ctr., Washington, District of Columbia* 20306 (DAOB6608)

Computer simulation of the kinematics of occupants in selected aircraft accidents in order to recreate the sequences of injuries and to determine their specific cause(s). This will lead to an increased understanding of the pathogenesis of such injuries and lead to more effective means of preventing them. Examine feasibility of running concurrently the KRASH vehicle impact simulation code so as to enhance the realism of occupant-vehicle interaction.

APPROACH: Operate the CALSPAN three-dimensional program as a model using selected Aerospace Pathology Division cases as sources of input data. Correlate the actual injuries observed at autopsy with the injuries predicted from the occupant kinematics of the computer simulation. Use the optimal output features of the CALSPAN code, using subroutines to calculate injury severity indices and time points of maximum injury.

PROGRESS: The usefulness of the CALSPAN three-dimensional program model has been demonstrated for three primary situations. These are: (1) low-velocity fixed-wing aircraft accidents; (2) rotary winged aircraft accidents; (3) out-of-envelope ejections with partial man-seat separation. The need for improvement of the program centers about three areas: (1) the need for a simplified input deck with greater flexibility in selection of altitude; (2) the need for post-processing for analysis of injury data; and (3) the need for a programmable deformation of the 'vehicle' during a crash pulse. The CALSPAN three-dimensional program model, in its present form, is more useful as a research and development tool rather than a day-to-day tool for the investigation of routine accidents.

6.0007, ASSESSING PEER RATINGS

Dunnette, Personnel Decisions Research Inst. Inc., *821 Marquette Ave., Minneapolis, Minnesota* 55402 (DF233440; F33615-78-C-0041)

To assess the relationship between peer ratings of new enlistees and their relative success in the Air Force.

The peer ratings, biographic and aptitudinal information on about 20,000 basic trainees will be codified into a tape file. From this tape file, the contractor will perform statistical analyses to assess the ability of peer ratings to predict success in basic military training (BMT). It is estimated that this effort will take 12 months. The final product will be a technical report.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0008, AN EXPERIENCE-JUDGMENT APPROACH TO TACTICAL FLIGHT TRAINING

R.P. Meyer, Design Plus, *St. Louis, Missouri* (DF054660; F49620-79-C-0052)

AF function - this research supports AF programs in aircrew training, particularly the training of critical combat skills in the tactical arena, and supports the AF Simulator Procurement Program. Deficiency - the basic principles of learning which are needed to design effective visual simulators for training tactical flying skills are only partly known. Without research in this area, visual scene modeling for tactical simulation will fall short of its potential training effectiveness. Objective - the objective of this research is to discover visual simulations which are highly effective for teaching critical tactical flying skills. How research contributes - this research will uncover new concepts in visual simulation which can be used by instructional theorists and systems designers for creating tactical training materials.

The principal investigator will catalog old visual training materials currently used for tactical training. A taxonomy of tactical flying skills will be employed to determine whether these materials are adequate for all of the required tasks. A second inventory will determine what critical combat skills are not being taught in on-going flying programs due to risk. Then, existing visual materials which could train these tasks will be indexed. Tasks for which visual materials are needed, or current materials need improving, will be identified, and innovative scene modeling concepts will be used to build candidate scenes for training these tasks.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

6.0009, ADVANCED TRAINING TECHNIQUES USING COMPUTER-GENERATED IMAGERY
D.B. Coblitz, McDonnell Douglas Electronics Co., *St. Charles, Missouri* (DF055000; F49620-79-C-0067)

AF function - this research supports Air Force programs in flight and technical training. Deficiency - the Air Force is making significant investments in computer-generated imagery systems for use in training environments, such as flight simulator visual systems. To make optimum use of these systems, more must be known about different types of scene modeling which can result in effective training for complex skill learning. Objective - the objective of this research is to investigate new concepts of computer-generated imagery which can be used effectively in training. How research contributes - this research will expand the use of computer-generated imagery systems in flight and technical training. It could significantly increase the number of skill categories which are now practiced using such systems.

Several training tasks from advanced flying programs will be studied, especially those involving combat skills, and tasks which might benefit from innovative scene modeling will be dissected into meaningful segments. Concepts using unique visual models will be investigated in the context of these task segments to see if training methods can be developed which provide cues that may not be available in the real world but which may add significantly to the speed, quality, or scope of the training transfer. These concepts will be refined and tested in an aircrew training environment.

6.0010, TRAINING EFFICIENT MULTIPLE-TASK PROCESSING STRATEGIES
D.L. Damos, State University of New York, Albany Campus, Graduate School, *1400 Washington Ave., Albany, New York* 12203 (DF053800; AFOSR-79-0014)

AF function - this research supports aircrew training programs, particularly the learning and performance of the types of skills characteristic of combat. Deficiency - modern weapon systems performing in combat-intensive environments place high demands on the aircrew. While some details of how the pilot learns to process information under stress are known, our knowledge of how to train information-processing skills remains deficient. Objective - this research will study ways to train pilots to resist information-processing stress. How research contributes - the results of this effort will feed into aircrew training technology, with potential impact on the structure and context of training programs.

The proposed effort covers a four-year period of investigation. The initial year will involve two experiments, both using a dual short-term memory and classification task. If individual strategy preferences can be detected, then operators will be trained to see if they can learn a non-preferred strategy, i.e., to determine their capability to learn new strategies. If operators can change their strategies, the second experiment will study efficient methods for training these new strategies. These methods will include adaptive training, pre-training, feedback manipulation, and instruction-demonstration.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

6.0011, ASSESSMENT OF SCENE COMPLEXITY AND CUE VALIDITY IN VISUAL FLIGHT SIMULATION
H.G. Shulman, Ohio State University, Columbus Campus, School of Arts & Sciences, Dept. of Psychology, *190 N. Oval Dr., Columbus, Ohio* 43210 (DF055140; F49620-79-C-0070)

AF function - this research supports Air Force programs in aircrew training, especially flight simulator technology. Deficiency -computer-generated image systems allow many different visual scenes to be presented to pilots flying in sophisticated simulators. Little is known about which scene features are most important to achieve high levels of training transfer. Furthermore, there is no adequate measure of scene complexity to use to describe different scenes. Objective -this research has two objectives. It will study earlier attempts to measure scene complexity and develop a valid metric for use by training researchers and it will develop the methodology for assessing the importance of different scene features for training various flying tasks. How research contributes - this research will provide useful methodological tools which researchers in training simulation can use to develop optimum visual simulations for aircrews.

Two research tasks will be pursued. 1. The human visual system will be assumed to analyze information about the distribution of spatial frequencies in a scene by using autocorrelations. A method will be developed for calculating autocorrelations for a given scene and relating them to human performance on tasks which are relevant to simulated and actual flight. If a strong relationship is established between this metric and performance, then it can be used to establish training efficiency, along a continuum anchored by simplified schematic images on one end and high detail, realistic images on the other. 2. The principal task of a pilot using terrain features in controlling his vehicle is assumed to be the use of key transformations in the visual scene for determining depth, altitude, speed, vertical velocity, etc. Using an interactive visual flight simulator, the research team will try to isolate these transformations and develop custom-tailored visual scenes which speed the learning of transformations for students learning specific tasks.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

6.0012, LDF-3, APPLICATION OF OPTIMAL ESTIMATION TECHNIQUES TO BIODYNAMIC IMPACT DATA
J.H. Raddin, U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF325470)

Recent requirements for biodynamic testing have placed more stringent demands on test instrumentation and data analysis in order to provide accurate, non-ambiguous descriptions of body part motion to allow useful mathematical model formulations. Current experimental technique involves the use of inertial sensors and photographic instrumentation in order to provide data on body part motion. However, since the inertial instruments generally measure rate or acceleration, and the photographic instrumentation provides measurements of position, these data outputs have classically been analyzed separately with poor correspondence when compared. This deficiency has led to difficulties in relating data from experiments to mathematical models. The objective of this effort, therefore, will be to develop a technique to utilize all available information sources in order to derive the statistically optimum estimate of body part motion in both the translational and angular sense.

This effort will take advantage of well developed technology in the field of inertial guidance and adapt techniques for use in the biodynamic application, thus assuring a high potential return on investment. The basic technology of the optimal estimator or Kalman filter will be adapted to function as a data analysis tool for impact experiments using inertial and film-derived data. Equations will be developed to produce the optimal estimate of body position, velocity, and acceleration (both in a translational and angular sense) using data derived from biodynamic impact experiments carried out within AMRL. Independent sensors located at other points on the structure being measured will be utilized to assess the accuracy of the estimation technique. Information will also be gained from this effort to assess the relative advantages and disadvantages of the various approaches to angular and translational motion sensing. This information will be an inherent product of this effort since those information sources contributing most directly to an optimum estimate will be more heavily weighted in the mathematical model than will sensors which contribute relatively little information or contribute information which is provided more accurately by other information sources available in the experiment. The money will be put on contract F33615-76-C-0520 with Dynalectron Corporation, work unit 72311607 as an expansion of effort.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab.

6.0013, SUBJECTIVE EFFECTS OF MULTI-AXIS OSCILLATING INERTIAL FORCE ENVIRONMENTS
R.W. Shoemberger, U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF321240)

To investigate the subjective effects of whole-body vibration in the pitch, roll, and yaw axes and in multi-axis environments. Subjective response data are available for the three translational axes (x, y and z) and this effort will extend that knowledge to rotational vibrations and to environments with simultaneous oscillations in (or around) more than one axis. The information obtained will result in improved and expanded vibration criteria for evaluating aircrew exposure to operational multi-axis oscillating inertial force environments, and provide data for improved crew station design to alleviate adverse vibration effects.

Psychophysical measurement techniques (e.g., psychophysical matching and magnitude estimation) will be used to evaluate the severity of vibration inputs. Subjects will be exposed to single axis angular vibrations (pitch, roll and yaw) as well as combined multi-axis inputs in both translational and angular modes. Subjective intensity comparisons will be made using single axis translational vibrations (for which there are existing criteria) as comparison standards. Data analysis will provide assessment of the subjective effects of angular vibrations in relation to translational motion and techniques for evaluating the subjective intensity of multi-axis vibrations.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab.

6.0014, DEVELOPMENT AND EVALUATION OF CIG TECHNIQUES

W.L. Foley, U.S. Dept. of Defense, Air Force, Human Resources Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF228920)

The objective is to develop, implement and perform engineering tests of various potential improvements to CIG. This will include evaluation of non-linear terrain generation methods, circular features techniques, new texturing methods, and new CIG concepts based on application of human perceptual characteristics. The effort will include informal but structured engineering evaluations and the development of refinements necessary to resolve problems.

For each of the four study areas listed in the objective, several tasks will be accomplished. First, evaluation techniques and criteria will be developed. Then the method under study will be implemented on the advanced CIG techniques evaluation (ACTE) system and subjects will be selected based on their CIG expertise and their familiarity with the real world cues being simulated. The ACTE system will be used to generate static and dynamic scenes which will be used in this effort, as well as in another study designed to examine in more detail the impact of the method on human performance. Finally, the scenes will be evaluated by the subjects using the selected criteria. As required, refinements and re-test will be accomplished prior to documentation of results.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0015, EFFECTS OF PROLONGED NOISE EXPOSURE - A LONGITUDINAL STUDY

S. Cohen, Oregon State Higher Education System, University of Oregon, School of Liberal Arts, Dept. of Psychology, *1472 Kincaid St., Eugene, Oregon* 97401 (BNS77-08576)

Laboratory research indicates that short-term exposure to environmental stress can be detrimental to task performance, and result in motivational and cognitive deficits. That research emphasizes acute rather than long-term effects. The present research deals with long-term effects of exposure to noise over long periods of time. The Principal Investigator investigates the effect of noise on the students in three schools near a busy airport. All three schools will be modified to reduce noise levels, but not all will be modified at the same time. The research examines the effect of noise and the noise reduction on attentional focusing, ability to tune out distracting noise, verbal ability, expectancy of control, and health.

6.0016, EYE MOVEMENT AS AN INDICATOR OF VISUAL WORK OVERLOAD IN AIRCREW PERSONNEL

G.T. Chisum, U.S. Dept. of Defense, Navy, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate, *Warminster, Pennsylvania* 18974 (DN081176)

Virtual image devices are being developed to provide a means of displaying information to aircrew members under a head-out-of-the-cockpit attitude. The amount and type of information to be displayed and the specific schemes for presentation of the information are currently in the process of being proposed and investigated. A method of evaluating the alternatives is required. The objective of this work is to evaluate the use of eye movements as an objective, non-intrusive, non-interfering method of assessing the effect on performance of the alternatives regarding virtual image display information amounts and design. The method can then be used to provide the information which will give guidance in selecting the most suitable alternative for display of information. The method will also be useful for the evaluation of the complexity and optential efficiency of any visual environment.

Visual tasks which are complicated enough to permit demonstration of performance levels, but simple enough to be readily quantified for use in the validation of an objective measure of efficiency, will be selected. Eye movements during the peformance of the tasks will be monitored. The difficulty of the tasks will be varied. Number of detections, indentifications or tracking scores, depending on the task selected, will be recorded as a function of task difficulty. Eye movements will be recorded and correlated with the task difficulty and performance scores. The correlation score will provide an indication of the validity of the eye movement measure as a means of objectively measuring visual efficiency. Eye movements can then be used to assess other tasks, and to predict effect on performance of various task or display designs.

6.0017, SELECTION FOR PILOT TRAINING

H.E. Jensen, U.S. Dept. of Defense, Air Force, Human Resources Lab., *Brooks Air Force Base, San Antonio, Texas* 78235 (DF234200)

1. Norming of AFOQT. 2. Investigation of new measures to be used in pilot selection. 3. Validation of AFOQT, PAPAMS, and experimental measures against UPT, CCTS, and operational performance. 4. Identification of characteristics of superior pilots. 5. Evaluation of the effect of the Flight Screening Program on UPT performance.

AFOQT will be normed on AFA, AFROTC, and OTS samples. New perceptual and psychomotor measures including the portable automated pilot aptitude measurement system (PAPAMS) will be investigated to determine their relationship to performance in UPT, CCTS, and operational settings. Phase I - AFOQT-N and APD norming study evaluation of flight screening program. Phase II - experimental testing program. Phase III - collection of criterion performance data through UPT, CCTS, and after one year in an operational setting.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0018, PERSONNEL TECHNOLOGY - EFFECTS OF LIFE STRESS AND COPING SKILLS ON PERFORMANCE AND ORGANIZATIONAL EFFECTIVENESS

I.G. Sarason, University of Washington, School of Arts & Sciences, Dept. of Psychology, *Seattle, Washington* 98105 (DN575416; N00014-75-C-0905)

In developing personnel who will later be exposed to high levels of stress (e.g., aviators, submariners, UDT personnel), the Navy and MARCORPS are limited by gaps in our knowledge of the fundamental relationships among situational stressors, life stress, individuals' coping skills, and organizational effectiveness. This work unit is designed to clarify these relationships and experiment with various individual and organizational procedures for improving the ability to cope with stress in organizational contexts.

Earlier research has demonstrated that stress is associated with morbidity and with decreased performance in certain kinds of situations. This research is producing new measures designed

to assess organizational stress. The investigator is experimenting with various techniques for altering cognitive responses since these are hypothesized to be involved in mediating the deleterious effects of stress on performance. The initial experiments in civilian groups exposed to high levels of job stress (e.g., firemen), will, if successful, be extended to certain military groups working under high stress conditions.

7.0001, ANALYSIS AND MODELING OF INFORMATION HANDLING TASKS IN SUPERVISORY CONTROL OF ADVANCED AIRCRAFT

R. Steeb, Perceptronics Inc., *6271 Variel Ave., Woodland Hills, California* 91364 (DF055730; F49620-79-C-0130)

AF function - increasing supervisory loads are being imposed on the pilot in advanced aircraft operations. Future aircraft will be characterized by high information loads, severe time constraints, and complex decisions regarding allocation of display resources. Deficiency - the information costs and the limited processing capabilities of the human operator make it necessary to optimize the information selected, processed and displayed. Objective - the research will establish new techniques for the selection of essential information in airborne tactical operations. How research contributes - the program will result in aids for the real-time analysis and management of information selection in advanced aircraft.

The techniques will center on the use of multi-attribute utility models, adaptive estimation methods, and queuing theory formulation to model individual supervisory control behavior. Specifically, the research will: (1) formulate a working taxonomy of supervisory control functions in advanced aircraft operations, (2) investigate the behavioral issues of operator acceptance of and confidence with the possible levels of model-based aiding, (3) generalize the model form to include continuous monitoring and control functions, and (4) produce guidelines for field applications of the information evaluation and management programs in operational airborne systems.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

7.0002, APPLIED PARTIAL DIFFERENTIAL EQUATIONS AND NUMERICAL ANALYSIS

S.J. Osher, University of California, Los Angeles Campus, School of Letters & Science, Dept. of Mathematics, *405 Hilgard Ave., Los Angeles, California* 90024 (MCS78-01252)

Renewal of MCS-7604412.

This research concerns partial differential equations of hyperbolic type and of mixed type, with strong emphasis on their numerical solution. For hyperbolic problems the investigator will study non-linear instability, propagation of error, and the effects of boundaries. For mixed type problems he will deal with a method effectively of splitting the problem into separate elliptic and hyperbolic problems. Along the line of non-numerical work, the investigator will continue study of well-posedness and regularity for hyperbolic differential equations. He may also extend his recent analysis of certain equations of mixed type to those of transonic flow.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Mathematical & Computer Sciences

7.0003, RESEARCH IN ALGEBRAIC MANIPULATION

J. Moses, Massachusetts Inst. of Technology, School of Engineering, Dept. of Electrical Engineering & Computer Science, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DF056340; F49620-79-C-0200)

AF function - design of aerospace vehicles. Deficiency - algebraic manipulation is still primarily done with pencil and paper. Objective -to improve capabilities for algebraic type manipulation on a computer. How work contributes - by reducing computer time and memory requirements.

Often the final answer is a short expression while intermediate expressions are long, as for example in obtaining the multivariate polynomial greatest common divisor used in simplifying rational functions. The proposed research builds on the idea that the information required may be a particular term or the polynomial may be sparse. For example, random values inserted for all but one of the variables map a difficult problem into a simpler one which however retains features of the full problem unless accidental cancellations occur. The probability of this occurring can be estimated and reduced. By solving a hierarchy of such simpler equations, using the information obtained along the way, much more effective algorithms can be obtained. Computer time is a polynomial function of the number of terms of the solution polynomial instead of exponential in the order of the solution polynomial. Intermediate expression swell is also reduced.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

7.0004, DATCOM UTILIZATION AND IMPROVEMENT

J.E. Williams, McDonnell Douglas Astronautics Co., *E. 411 St., St. Louis, Missouri* 63166 (DF141500; F33615-78-C-3610)

A continuing effort is required to improve DATCOM coverage by refining existing methods and adding new techniques in concert with rapidly advancing technology. The objective of this effort is to determine the major shortcomings of DATCOM as it applies to modern design trends and to investigate potential means of overcoming these weaknesses. A uniformly valid and complete set of prediction methods which could be used with confidence in early design would eliminate much of the uncertainty and consequent expense now associated with this phase of design.

The digital DATCOM will be used to conduct parametric studies of modern configurations, thereby assessing the value of existing DATCOM methods and the relative value of various factors involved in the calculations.

8.0001, ELECTRON MICROSCOPY OF ATOM CONFIGURATIONS IN FAULTED CRYSTALS

S. Iijima, Arizona State University, School of Liberal Arts, Dept. of Physics, *Tempe, Arizona* 85281 (DMR78-09291)

This research will be a study of defects in complex inorganic crystals using high resolution electron microscopy (HREM). Results of this work will be of importance to a number of areas of ceramic science, since many fundamental properties depend on the detailed nature of lattice defects. The research objectives will be two-fold: (a) to determine the nature of extended defects, such as planar faults, in complex oxides and other compounds, and (b) to continue improving the performance of present electron microscopes by refining the resolution capability even further. Theoretical interpretation of HREM images that are recorded under precisely controlled operating conditions will allow detailed comparisons to be made between experimental image contrast and contrast determined by computer simulation.

Additional research will include attempts to examine extremely small clusters of metal atoms which are prepared on thin graphite films, and to initiate studies using HREM to examine the structure of amorphous solids.

This program is a continuation of research initiated under NSF Grant DMR76-06108 A02.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0002, ORGANIC AND ORGANO-METALLIC CONDUCTORS AND SUPERCONDUCTORS

W.A. Little, Stanford University, School of Humanities & Sciences, Dept. of Physics, *Stanford, California* 94305 (DMR76-82087 A02)

The overall goal of this project is to advance our knowledge of the solid-state physics and chemistry of compounds containing strongly interacting substructures so their physical properties can be understood, designed and predicted. Part of this work is concerned with the broad question of the attainability of high-temperature superconductivity through systematic study of linear chain compounds. This includes the synthesis of polarizable ligand systems, plus model studies of stacked arrays of square planar complexes and the effects of oxidation upon them. Physical properties are measured and studies made of theoretical problems bearing on high Tc (critical temperature) materials.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0003, SPECTROSCOPY AND QUANTUM ELECTRONICS

A.L. Schawlow, Stanford University, School of Humanities & Sciences, Dept. of Physics, *Stanford, California* 94305 (PHY77-09687 A02)

The application of modern optical devices, such as advanced kinds of lasers, is proposed for basic studies in physics. In the course of these studies, the laser techniques will be refined and extended, and new sensitive methods of laser spectroscopy will be explored and developed. The extremely high resolution permitted by the techniques of Doppler-free nonlinear spectroscopy (saturation, polarization, two-photon) will be used to study fine and hyperfine structures in spectra of atoms and simple molecules. Use of short laser pulses in new ways for high-resolution spectroscopy and the extension of high-resolution methods to shorter ultraviolet wavelengths are planned. The spectrum of simple one-electron atoms will be studied in high resolution, to probe the limits of quantum electrodynamics, and to improve the values of fundamental constants. Saturation and polarization labeling techniques will be used and extended to simplify the analysis of complex atomic and molecular spectra. New techniques for measuring wavelengths and frequency intervals will be developed and studied. Laser methods for the ultrasensitive and highly selective detection of atoms and molecules will be explored. The development of a dye-laser-like tunable ultraviolet laser, pumped by a molecular hydrogen laser, which would be a valuable tool for laser studies of atoms and molecules, is also planned.

This work is a continuation of that currently supported under NSF grant PHY74-14786A03.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0004, PLASMA COLLECTIVE ION ACCELERATION

A. Fisher, University of California, Irvine Campus, School of Physical Sciences, Dept. of Physics, *Irvine, California* 92664 (DN975487; N00014-79-C-0560)

The Navy needs quantitative information on methods to generate intense ion beams with energies up to 1 geV for directed energy applications, sources of intense radiation through impact with targets, new sources of energy via interaction with pellets, etc. The electron beam front collective acceleration of ions to be carried out in this contract has the scaling characteristics which are necessary to fulfill the requirement stated above.

The beam front of a high current relativistic electron beam creates a very strong electric field capable of accelerating ions to geV energies over short distances. Controlling the motion of the electron beam front over distances of 10's of meters has been a major problem in the area of collective acceleration. In this contract, two novel concepts are utilized to accomplish this: (a) the use of a strong longitudinal magnetic field to maximize the length of propagation, and (b) the use of a programmed, externally generated plasma to provide the charge neutralization needed to propagate the space charge limited intense beam current front.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0005, ENGINEERING RESEARCH INITIATION - THEORETICAL INVESTIGATIONS OF RECOMBINATION CENTERS IN SEMICONDUCTORS

D. Pan, University of California, Los Angeles Campus, School of Engineering & Applied Science, Dept. of Electrical Sciences & Engineering, *405 Hilgard Ave., Los Angeles, California* 90024 (DMR78-05783)

This research will be a detailed theoretical investigation of two important problems about recombination centers in semiconductors. The first system which will be investigated is the hole recombination center of the two-electron impurity state of oxygen in gallium phosphide. The role of a complex structure, formed after the capture of the hole and before the recombination, will be studied in detail. The ground and excited states of this complex are of importance to determine various recombination mechanisms of quite different physical origin. Those states will be first studied in detail. The Auger recombination rates for those states will then be calculated. The recombination cross-section will be calculated in a cascade model. The result may shed new light about the mechanism of recombination centers which has many important technical applications. The second system to be investigated is the zinc-oxygen center in gallium phosphide light-emitting diodes (GaP LEDs). Various electronic states bound to Zn-O center will first be investigated. The potential energy as a function of the positions of Zn and O will be calculated in a simple model for various electronic states. The rate of 'dissociation' of the Zn-O pair will be estimated in a way similar to the theory of pre-dissociation of molecules.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0006, SOME THEORETICAL STUDIES OF THE PROPERTIES OF CONDENSED MATTER

P.A. Pincus, University of California, Los Angeles Campus, School of Letters & Science, Dept. of Physics, *405 Hilgard Ave., Los Angeles, California* 90024 (DMR78-10312)

Research previously supported by DMR7519544.

Theoretical research in condensed matter physics will be carried out. Some of the topics to be studied will include: quantal adiabatic hopping; hopping in the ultra-weak dispersion regime; hopping in a molecular crystal with Morse-type intramolecular vibrational potentials; higher-order multiphonon calculations; the mechanism of self-trapping of electrons, holes and excitons; excitation transfer in disordered systems; spin flip scattering near the glass transition in spin-glasses; magnetic anisotropy of strongly mixed magnetic moments in dilute magnetic alloys; fluctuations in superconductors near the critical temperature; macromolecular physics; polyelectrolytes; deformed entangled polymer solutions; and nematic polymers.

This is the first year of a three-year continuing grant.

8.0009, THEORETICAL STUDIES ON SPIN GLASSES, ELECTRONS IN DISORDERED SYSTEMS, AND TWO-DIMENSIONAL PHASE TRANSITIONS

D.J. Thouless, Yale University, Graduate School, *206 Elm, New Haven, Connecticut* 06520 (DMR79-08329)

Theoretical research will be carried out on three topics: (1) Spin glasses, in which the nature of electron localization will be explored, and the details of phase transitions will be investigated - of particular interest will be the effect of an external field on the critical properties. (2) Electrons in disordered systems - the general problem of localization will be studied, in reference to the properties of disordered solids, such as maximum resistance, the Hall effect and the behavior of the conductivity in an external magnetic field. (3) Two-dimensional phase transitions - the consequences of the vortex driven transition (Kosterlitz-Thouless model) will be worked out. In particular, an explanation of the properties of helium films will be developed.

This is the first year of a three-year continuing grant.

8.0010, HIGH-FIELD STUDIES OF SUPERCONDUCTING LAYERED COMPOUNDS

D.E. Prober, Yale University, School of Science, Dept. of Engineering & Applied Science, *206 Elm, New Haven, Connecticut* 06520 (DMR78-17957)

This is a continuation of the work sponsored under DMR76-09591 and entails an experimental study of the high magnetic field properties of superconducting transition-metal dichalcogenides layer compounds. A miniaturized high frequency resonant circuit has been designed and constructed which will allow one to measure Tc and Hc(T) of oriented microcrystallites (mass less than 1 microgram) of compounds of interest. These include TaS2 intercalated with long-chain amines, metallocene intercalated complexes and the unintercalated alloy series Nb1-xTaxSe2. This work is important for our understanding of the basic microscopic nature of the super-conducting state in these layered systems and has potential for impacting upon technologically important high-field superconductors in general.

This is the first year of a three-year continuing grant.

8.0011, COMPUTER SIMULATIONS OF MAGNETIC SYSTEMS

D.P. Landau, University of Georgia, Franklin College of Arts & Sciences, Dept. of Physics & Astronomy, *Athens, Georgia* 30601 (DMR76-11329 A01)

Research previously supported by DMR76-11329.

Theoretical research in condensed matter physics will be carried out. The main thrust of the investigations will be to study the thermal and magnetic properties of magnetic systems using importance sampling Monte Carlo methods. Emphasis will be placed on the examination of models exhibiting multicritical phenomena in two and three dimensions. These studies will include the location of phase boundaries and multicritical points and an examination of the associated critical and multicritical behavior. More detailed studies of 'impure' and 'random' systems will be pursued and investigations of models with long-range interactions will continue. The low temperature behavior of these models will be studied using the new 'n-fold way' algorithm.

This research will help to illuminate the behavior of a material which is changing phase and will be particularly useful in circumstances where the more analytical theories do not apply.

8.0013, THE EFFECT OF A ZERO G ENVIRONMENT ON FLAMMABILITY LIMITS AS DETERMINED USING A STANDARD FLAMMABILITY TUBE APPARATUS

R.A. Strehlow, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Aeronautical & Astronautical Engineering, *207 Engineering Hall, Urbana, Illinois* 61801 (NSG 3293)

SUPPORTED BY U.S. National Aeronautics & Space Admin.,
Lewis Research Center

8.0014, INTERDISCIPLINARY PROGRAM OF MATERIALS RESEARCH

C.P. Flynn, University of Illinois, Urbana Champaign Campus, School of Liberal Arts & Sciences, Dept. of Physics, *Urbana, Illinois* 61801 (DMR77-23999)

Major interdisciplinary programs are being pursued in three areas. The effects of structure modulation are studied in Microscopically Modulated Materials, where theoretical and experimental investigations of property variation are being carried out. Of special interest are the effects on the fluctuations, on mor-

phology and dynamics of phase transitions, and on the control of the resulting properties.

The program on Optical Semiconductors emphasizes the quaternary system In-Ga-As-P, in which materials exhibiting a large range of band gap width can be prepared. Such materials can be used in optical devices tuned to selected wavelength.

The program on Compound Catalysts emphasizes non-metallic catalysts, and is currently primarily concerned with the theory of surfaces. The development of instrumentation for proving the properties of clean and of doped surfaces is the initial objective.

Significant support is provided for the operation of central facilities and for additional research on liquids, on disordered solids, and on structural alloys. Close coordination with a research program co-supported by the Department of Energy is maintained locally.

This award is a continuation of DMR76-01058 A01 and is the first year of a three-year continuing grant.

8.0015, RESEARCH IN NUCLEAR ASTROPHYSICS

J.W. Truran, University of Illinois, Urbana Champaign Campus, School of Liberal Arts & Sciences, Dept. of Physics, *Urbana, Illinois* 61801 (AST78-20123)

The research to be carried out in this grant will be primarily concerned with two broad topics in nuclear astrophysics: (1) the mechanisms by which heavy nuclei are formed in stellar interiors, novae, and supernovae, and (2) the consequences of mass accretion onto white dwarf stars in aging binary systems. Detailed calculations have shown that the composition of matter ejected in nova and supernova explosions is consistent with the abundances of material in the solar system. It has also been demonstrated that luminous and rapidly evolving red giant stars are also the formation site of a class of heavy nuclei ranging from the heaviest isotopes of iron through mercury and lead. Nova explosions have been shown to result from the accretion of hydrogen-rich material onto the surfaces of white dwarf stars in binary systems.

Studies which will be carried out include: (1) studies of the hydrodynamics of nova explosions; (2) the accretion of matter onto white dwarf stars; (3) the synthesis of elements in the outer atmosphere of a supernova; (4) the synthesis of elements in the interiors of red giant stars; (5) the formation of dust grains in novae and supernovae; and (6) the behavior of neutron star matter at high temperatures and densities.

This is a continuation of research previously supported under NSF grant AST77-21563.

8.0016, HISTORY OF PLANETARY PHYSICS

S.G. Brush, University of Maryland, College Park Campus, Inst. for Physical Science & Technology, *College Park, Maryland* 20742 (SOC77-26749)

Dr. Brush is conducting historical research in the area of nineteenth and twentieth century geophysics and astrophysics, with special emphasis on the connections of these sciences with the so-called 'fundamental' parts of physical science (atomic theory, thermodynamics, electromagnetism, relativity). In addition to publications on the history of planetary physics, he expects that the project will ultimately lead to a book on the history of modern physical science in which the development of planetary physics and its relations to other disciplines are included.

Dr. Brush is currently concentrating on a detailed study of changes in ideas about the early development and internal constitution of the earth since 1830, and on the development of astrophysical, geological and chemical sciences relating to theories of the origin of the solar system in the twentieth century. He is examining aspects such as the impact of discoveries in celestial mechanics, radioactivity, and seismology, reasons for the rejection and later revival of ideas such as nebular origin of the solar system, planetesimal hypothesis, fluid regions inside the earth, and continental drift; and the interactions of scientific disciplines such as astronomy, physics, geology, chemistry and applied mathematics.

8.0017, MAGNETIC RESONANCE IN IONIC SOLIDS

I.Y. Chan, Brandeis University, School of Arts & Sciences, Dept. of Chemistry, *415 South St., Waltham, Massachusetts* 02154 (DMR74-18095 A01)

Electron nuclear double resonance (ENDOR) of 19F is used to investigate the behavior of Jahn-Teller active ions in fluorite crystals. Vibronic interaction in such species leads to characteristic modification of hyperfine interaction of the F nuclei with the electronic system of the center ions. Precise measurements of the hyperfine interaction constants by ENDOR in turn provide information of the Jahn-Teller active system. Specific objectives are to: 1. Continue and complete ENDOR studies of the Cu2 ion:CdF2 system. ENDOR frequencies as a function of magnet angle are measured along three independent planes. Hyperfine coupling constants are extracted by least squares methods. The distorted geometry of this static Jahn-Teller system will be deduced from the dipole model. The nature of the Jahn-Teller active vibrational mode will be elucidated. 2. Test the feasibility of an ENDOR experiment on the Fe2 ion:KMgF3 system based on the double quantum EPR transition. A measurement of the hyperfine constants in this dynamic Jahn-Teller system will provide information on orbital reduction.

This is a continuation of research supported under DMR 74-18095.

8.0018, ANALYTICAL METHODS IN MANY-BODY PHYSICS

E.P. Gross, Brandeis University, School of Arts & Sciences, Dept. of Physics, *415 South St., Waltham, Massachusetts* 02154 (DMR76-02048 A01)

Research previously supported by DMR76-02048.

Theoretical research in condensed matter physics will be performed which is designed to develop and improve mathematical approximations in the physics of many-body systems and in the study of particle field and random potential interactions. Techniques which have been developed in the theory of the dynamics of classical dense gases, liquids and plasmas will be extended to apply to general many-body systems. The theory of particle field and random potential interactions will be developed, with the aim of finding a systematic theory for the strong and intermediate coupling domains comparable to the existing theory for weak coupling.

The aim of this research is to increase our understanding of the fundamental interactions which determine the behavior of condensed matter.

8.0019, FUNDAMENTALS OF MAGNETIC INTERACTIONS - NEW APPROACHES TO THEORY AND EXPERIMENT

A. Lempicki, General Telephone & Electronics Corp., G T E Laboratories Inc, *40 Sylvan Rd., Waltham, Massachusetts* 02154 (DF056180; F49620-79-C-0182)

AF function - this proposed research primarily falls in the 7.4 research objectives which deal with the theoretical and experimental investigations of electronic, optical, acoustic, thermal, magnetic and conducting properties of materials to evolve new and improved device concepts. In particular, this is an extensive experimental and theoretical investigation directed at elucidating the fundamentals of magnetic interactions and light-

induced magnetic phase transitions. Deficiency - a wide range of basic research efforts that support the development of devices and device concepts are needed for the application of contemporary electronic electromagnetic technology in the operational Air Force. Most studies of magnetic properties utilize model Hamiltonians, and model potentials which are incorrect on first principles considerations. Objective - the major emphasis will be on achieving a light-induced magnetic phase change and an extensive fundamental calculation aimed at a complete qualitative prediction of the magnetic structure. Contribution - this research is part of a comprehensive program in statistical mechanics to study phase transitions.

The main goal of this research is a complete understanding of the nature of the coupling of the electronic spins, both orbital and intrinsic angular momenta, which give rise to the phenomena of cooperative magnetism. This does not exist at this time for any material. Light offers a sharp probe of magnetic interactions in certain magnetic semiconductors, insulators and certain rare-earth metals that have magnetism highly sensitive to external influences. It can alter electronic spins directly, and alter populations of electronic states responsible for the coupling which is called opto-magnetism. It is proposed to combine a team of physicists, from industry and universities, to obtain just the aforementioned understanding of magnetism.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

8.0020, PROPERTIES OF AMORPHOUS SEMICONDUCTORS

W. Paul, Harvard University, Cambridge Campus, School of Arts & Sciences, Dept. of Engineering & Applied Physics, *Cambridge Station, Cambridge, Massachusetts* 02138 (DMR78-10014)

This a continuation of research previously supported by NSF grant DMR-7615325.

Samples of amorphous group 4 and group 3-5 semiconductors with incorporated hydrogen and other dopants will be prepared and characterized chemically and structurally. Appropriate property measurements, among them photoluminescence, electron spin resonance, optical and transport, will be carried out and correlated in order to gain a comprehensive, self-consistent model of the behavior of the substance. Special attention will be paid to the possibility that strong electron-phonon interactions affect the optical properties through developing Stokes shifts and the transport properties through the creation of small polarons. Measurements made as functions of the hydrogen content of the films will be done in order to try to separate out the intrinsic properties of the disordered element or compound from those of the alloy with hydrogen. In the case of the binary compounds, special attention will be paid to the effects of like-atom bonds in determining the properties.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0021, ELECTRONIC STATES IN DISORDERED MATERIALS

A. Bansil, Northeastern University, College of Arts & Sciences, Dept. of Physics, *360 Huntington Ave., Boston, Massachusetts* 02115 (DMR79-02600)

The research to be performed will focus on the equilibrium electronic properties of disordered metals. The materials to be studied include noble and transition metal alloys and metallic glasses.

The disordered alloys will be investigated within the framework of the coherent potential (CPA) and the average t-matrix approximations (ATA), utilizing realistic muffin-tin potentials to represent the atoms. The question of calculating self-consistently charge densities and atomic potentials in transition and noble metal alloys will be studied. The extentions of the theory to obtain average momentum densities, measured by a Compton scattering or a positron annihilation experiment, will be taken up.

The theory will also be used to study the electronic spectrum of liquid metals and metallic glasses. The latter materials have many potential technological applications. In recent years a substantial body of experimental optical, photoemission, specific heat, magnetic susceptibility, Hall effect and residual resistivity data on liquid and amorphous metals has become available. The extent to which these data can be correlated within the present scheme will be investigated. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0022, DEVIATIONS FROM MATTHIESSEN'S RULE IN THE ELECTRICAL RESISTIVITY AND ATTENDANT EFFECTS IN OTHER TRANSPORT PROPERTIES (ABBREV)

R.I. Boughton, Northeastern University, School of Liberal Arts, Dept. of Physics, *360 Huntington Ave., Boston, Massachusetts* 02115 (DMR77-24023)

This is a continuation of the research previously supported by DMR-7513090.

The experimental research program consists of two parts. The first and major portion involves a series of measurements of the electrical resistivity in a specific group of polyvalent metals which exhibit large and systematic deviations from Matthiessen's rule which are not at present adequately described by theory. Definitive experimental tests of the 'Non-conservation of Momentum' theory will be carried out by studying the correlations between impurity scattering-induced deviations in the electrical resistivity with boundary scattering-induced deviations and deviations in the thermal resistivity, respectively. The second part of the research program entails a continuation of the investigation of the possibility of observing flux quantization in a normal metal through measurement of the Aharonov-Bohm effect.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0023, COHERENT FAR INFRARED SOURCES AND NONLINEAR PROCESSES

F. Brown, Williams College, Graduate School, Dept. of Physics, *Williamstown, Massachusetts* 01267 (ENG77-20145)

This program consists of the development of a deuterium water vapor and the application of the laser to the investigation of nonlinear processes in crystals at far infrared wavelengths. Laser powers in the range between 25 and 40 megawatts will be sought for discrete wavelengths lying between 50 and 150 micrometers. The nonlinear processes to be investigated include Raman scattering by electronic states associated with impurities in germanium and the generation of intense terrahertz acoustic signals in gallium arsenide. The acoustic studies will also deal with the determination of damage thresholds at far infrared wavelengths.

This is a continuation of research previously supported under NSF grant ENG-7503222.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

8.0024, FUNDAMENTAL INVESTIGATIONS USING POSITRONS AND POSITRONIUM

A. Rich, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Physics, *Ann Arbor, Michigan* 48104 (PHY77-28139)

Recent studies of the decay rate of ortho-positronium have shown a serious discrepancy with calculations based on current atomic theory. Further studies will be made of this decay rate in various environments (powder, gas, and vacuum). In addition, research will be initiated on the decay rate of para-positronium, on the allowed four-photon decay of positronium, and on the polarization of slow positron beams.

This is a continuation of work supported by NSF Grant PHY76-02398 A02.

SUPPORTED BY U.S. National Science Foundation,

8.0025, JOSEPHSON VORTEX PROPERTIES AND NONEQUILIBRIUM SUPERCONDUCTIVITY

J. Chen, Wayne State University, School of Liberal Arts, Dept. of Physics, *4841 Cass Ave., Detroit, Michigan* 48202 (DMR78-17813)

Research previously supported by DMR7402616.

A comprehensive experimental and theoretical investigation of nonequilibrium superconductivity in thin tin films as well as the electrodynamic properties of long Josephson tunnel junctions containing vortices will be made; techniques to be used include electron tunneling spectroscopy employing double junctions and ultrasonic attenuation measurements on thin films. Initial studies will concentrate on tin films and tin-tin oxide junctions. This work is important as the results will impact on emerging technologies such as ultrafast superconducting computers.

This is the first year of a two-year continuing grant.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0026, NEUTRON SCATTERING STUDIES OF THE TRANSITION METAL SESQUIOXIDES

S.A. Werner, University of Missouri, Columbia Campus, Graduate School, *205 Jesse Hall, Columbia, Missouri* 65201 (DMR77-27247)

Neutron scattering experiments will be carried out at the University of Missouri Research Reactor to investigate the highly unusual magnetic and electronic properties of the vanadium and titanium oxides. Large single crystals suitable for neutron scattering experiments have been obtained and will be used in the following experiments: 1) Measurement of the phonon dispersion in V2O3 above and below the semiconductor-to-metal transition (170 degrees K). 2) Measurement of the magnon dispersion in V2O3 below the Neel temperature. 3) Measurement of the phonon dispersion in Ti2O3 as a function of temperature. 4) Measurements on chromium-doped V2O3 at temperatures where the speculated Mott transition occurs. 5) Measurements of the magnetic ordering in titanium-doped V2O3 as a function of temperature.

This is the first year of a two-year continuing grant.

Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0027, COINCIDENCE AUGMENTED DIFFERENTIAL ION ENERGY-LOSS SPECTROMETRY

J.T. Park, University of Missouri, Rolla Campus, School of Science, Dept. of Physics, *Rolla, Missouri* 65401 (PHY78-07907)

This project in atomic physics studies the fundamental properties of the collisions of atoms at energies (up to 200 keV) well in excess of the atomic binding energies. A unique ion energy-loss spectrometer is used to measure the details of the collision process with a resolution of one part per million and better in energy, and simultaneously measure the scattering angles. It will be possible to measure the excitation of specific excited states in atomic hydrogen by incident protons, as well as the details of differential charge transfer scattering. In parallel, the collision products (including the photons emitted by excited atoms) will be detected. These studies will be extended to more complex atoms.

This is a continuation of work supported by NSF Grant PHY74-09671 A04.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0028, THEORETICAL STUDIES OF THE ELECTRON STRUCTURE OF SOLID SURFACES

J.C. Hermanson, Montana State University, School of Letters & Sciences, Dept. of Physics, *Bozeman, Montana* 59715 (DMR77-11862)

A theoretical model will be developed to examine the electronic structure of solid surfaces. The technique to be used will be an extension of the resolvent method which has been modified to treat a tight-binding model of solid surfaces. This method will be used to compute densities of states for the interpretation of the results of angle-resolved photoemission experiments on oriented single crystals. The initial aim of this work is to consider clean surfaces of solids, but a later objective will be the calculation of chemisorption behavior. This approach utilizes the best available band structure information and emphasizes the role of geometrical factors in determining surface quantum structure. Relaxation and reconstruction will be treated by modifying atomic interactions near the surface.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0029, ELECTRON CORRELATIONS AND PROPERTIES OF METALS AND INSULATORS

D.C. Langreth, Rutgers the State University of New Jersey, New Brunswick Campus, School of Arts & Sciences, Dept. of Physics, *Old Queens Bldg., New Brunswick, New Jersey* 08903 (DMR77-08694 A01)

Theoretical investigations of many-electron systems in condensed matter previously supported by NSF grant DMR-7509804 will be continued.

Specific topics to be addressed include: the effect of electron correlations near surfaces of metals, surface energy of metals, and related structural properties; exchange and correlation in non-uniform systems and the approximate methods used in them; real metal properties including magnetic effects; and high-energy excitations in solids, including the theory of high-energy probes of solids such as photon, photoelectron, and electron spectroscopies. These will be studied both with respect to bulk and surface properties.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0030, LOW TEMPERATURE THERMAL PROPERTIES OF AMORPHOUS SOLIDS AND NITRATE GLASSES

R.O. Pohl, Cornell University, Ithaca Campus, School of Arts & Sciences, Dept. of Physics, *Ithaca, New York* 14850 (DMR78-01560)

A systematic study of the thermal and dielectric properties of nitrate glasses at low temperatures will be carried out. This will include experimental measurements of the low temperature thermal conductivity and specific heat as well as of the optical and dielectric properties. Other amorphous and disordered solids exhibit anomalous behavior in their low temperature thermal and dielectric properties which may be characteristic of the disordered state. The goal of this research is to seek control of the anomalies in well prepared and well characterized nitrate glasses in order to identify those properties intrinsic to the amorphous state. A specific aim is to search for impurity modes in glasses associated with rotational or translational motion of impurity ions.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0031, THEORY OF CHARGE TRANSFER AT SEMICONDUCTOR-ELECTROLYTE INTERFACES

D. Mattis, Polytechnic Inst. of New York, Brooklyn Campus, School of Arts & Sciences, Dept. of Physics, *333 Jay St., Brooklyn, New York* 11201 (DN875508; N00014-78-C-0594)

Electrochemical processes at the semiconductor-electrolyte interface are important in many Navy areas of interest, includ-

ing photolysis of water, photovoltaic devices, corrosion and techniques for surface passivation of semiconductors. Improved devices and better control of many problems associated with electrochemical processes of surfaces will result from better understanding of the mechanisms associated with charge transfer and current flow at these interfaces.

The investigator is developing theoretical techniques to describe the charge exchange between semiconductor surfaces and adsorbed atoms. These will be applied to the charge transfer process occurring at the interface between a semiconductor and a liquid electrolyte while under illumination. Electronic eigenstates will be determined as will normal vibrational modes of the adatom. Other areas of application will be the interface between oxides and silicon and the compound semiconductors. Defect levels and resonant levels for tunneling mechanisms will be considered. Particular attention will be directed to the breakup of excitons impinging on the interface and its electron-ion analog in the photoelectrochemical cell problem.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0032, MULTIPLE X-RAY DIFFRACTION EFFECTS IN SINGLE CRYSTALS

B. Post, Polytechnic Inst. of New York, Brooklyn Campus, School of Science & Engineering, Dept. of Physics, *333 Jay St., Brooklyn, New York* 11201 (DMR77-02532 A01)

This investigation will be a study of the nature and techniques of multiple diffraction of X-rays by crystals, and the application to selected problems in materials science and solid-state science. The study will include highly precise lattice constants of crystals such as gallium arsenide, gadolinium gallium garnet, and magnetic oxides.

In addition, the experimental determination of phase relationships among X-ray reflections from single crystals will be made. This will be done by analyses of the intensity distributions in the X-ray fine structure of reflections recorded under conditions of multiple diffraction. The research will be broadened from the study of perfect crystals to less perfect crystals.

This is a continuation of research initiated under NSF Grant DMR75-23680.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0033, COMPUTATIONAL STUDY OF NONADIABATIC EFFECTS IN ATOM-MOLECULE REACTIVE SCATTERING

M. Redmon, Battelle Memorial Inst., Battelle Columbus Laboratories, *505 King Ave., Columbus, Ohio* 43201 (DF054510; F49620-79-C-0050)

AF function - Air Force operations in detection, surveillance, and other areas require knowledge of gas phase energy exchange mechanisms. Deficiency - there is a lack of detailed understanding of how energy transfer occurs between species in the atmosphere and in lasers. Objective - the goal of this research is to develop quantum mechanical computational techniques to study nonadiabatic effects in three-dimensional atom-diatom collisions. How work contributes - the results of this effort will lead to a fundamental understanding of energy exchange processes in atmospheric chemistry, combustion and lasers.

The first phase of this program will be devoted to obtaining a computationally feasible basis for representing the scattering wave function for rearrangement collisions involving ground and excited state carbon and oxygen with singlet sigma and doublet pi molecules. Then, couplings responsible for non-adiabatic transitions will be obtained, initially from diatomics-in-molecules theory.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

8.0034, PHASE TRANSITION IN SOLID HYDROGEN ALLOYS AND OTHER DISORDERED SYSTEMS

J.R. Gaines, Ohio State University, Columbus Campus, School of Mathematics & Physical Sciences, Dept. of Physics, *164 W. 17th Ave., Columbus, Ohio* 43210 (DMR78-07527)

Experimental studies will be made of phase transitions in solid hydrogen below 0.5K. Nuclear magnetic resonance techniques will be used to study single crystals containing very low concentrations of orthohydrogen. Measurements of the heat capacity of small samples of solid hydrogen will be made above and below the transition temperature. This work is important to understanding the behavior of quantum solids.

This is a continuation of work supported under DMR76-11427. First year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0035, ADVANCED CONCEPTS IN CLOSED-CYCLE ELECTRICAL DISCHARGE LASER TECHNOLOGY

R.A. Olson, Systems Research Lab. Inc., *500 Woods Dr., Dayton, Ohio* 45432 (DF460890; F33615-76-C-2177)

AF function - electrical discharge gas lasers. Deficiency - presently there are no coherent long-life light sources to simultaneously cover all transmission windows from 1 to 5 microns. Research - an existing research system will be improved in aerodynamics, power conditioning and excitation, including photoionization to meet AF requirements. A significant decrease in size and weight will be achieved by development of a compact configuration. The closed-cycle laser technology developed will be applied to other electrical discharge lasers of AF interest. How research contributes - this research supports several AF requirements for multiple wavelength medium power high rep rate sources in the visible-to-infrared spectral range for electro-optical countermeasures.

The state-of-the-art of closed-cycle laser technology will be improved further by developing and incorporating new aerodynamic configuration concepts, by improvements in the laser geometry, by further development of the fast pulse-high repetition rate power conditioning system and by improving the laser parameter range (wavelength, power, rep-rate), for example, with improved photo-preionization. A new coaxial-flow system will be developed and tested. The closed cycle-high purity technology will be applied to other selected electrical discharge lasers of AF interest.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

8.0036, MAGNETIC IMPURITIES AND RADIATION DAMAGE IN PEROVSKITE AND RUTILE STRUCTURED MATERIALS

W.A. Sibley, Oklahoma State University, School of Arts & Sciences, Dept. of Physics, *Agricultural Hall, Stillwater, Oklahoma* 74075 (DMR77-12594)

This research was previously supported under DMR-7302349 A01. This research will involve the growth, preparation and optical characterization of previously little studied fluoride materials. In particular, studies of the optical and radiation damage of 3-D and rare-earth impurities will be made in crystals such as MgF_2, MnF_2, $RbMgF_3$ and $RbMnF_3$. From past research in this program, it has been possible to assign optical transitions, both absorption and emission, to particular energy levels for transition metal ions such as Mn ions, Co ions and Ni ions, and to study the effect of radiation-induced defects on the optical properties of these impurities. This research will attempt to understand how energy transfer occurs in these materials and whether the lifetimes of the optical transitions are reduced greatly by the presence of defects. Also, it will be determined whether in $RbMnF_3$ and MnF_2 radiation damage affects the optical oscillator strength of the Mn ions. In general this research will continue the work of understanding up-conversion and energy transfer in these materials.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0037, RELATIVISTIC CALCULATIONS OF ENERGIES, AUGER RATES AND LIFETIMES

B. Crasemann, Oregon State Higher Education System, University of Oregon, School of Liberal Arts, Dept. of Physics, *1472 Kincaid St., Eugene, Oregon* 97401 (DF054220; AFOSR-79-0026)

AF function - this research contributes to RO 6.3, electromagnetic weaponry. Deficiency - energy levels and transition rates are needed in laser design. Objective - to develop and use methods of calculation of properties of atoms. Contributions - the availability of the results of this work will make it easier to develop new kinds of lasers since an accurate guide of atomic energy levels and transition rates will exist.

Atomic transition rates and configuration interaction energies are being calculated using a relaxed-orbital relativistic Hartree-Fock-Stater method. The total wave function is assumed to be a single Slater determinant of orbital functions, each of which is a solution of the DIRAC Hamiltonian.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

8.0038, THE STRUCTURE AND LATTICE DYNAMICS OF MONOLAYERS ON CRYSTALLINE SUBSTRATES

A.D. Novaco, Lafayette College, Undergraduate School, Dept. of Physics, *Easton, Pennsylvania* 18042 (DMR75-15630 A01)

A theoretical study will be made of the structure and lattice dynamics of monolayer films on crystalline substrates. These systems are examples of two-dimensional displacive incommensurate solids, with the incommensurate structure in the monolayer being driven by the substrate. A variety of systems will be examined, some being treated with perturbation theory and some with an extended version of the self-consistent phonon approximation.

Research previously supported by DMR75-15630.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0039, STATISTICAL MECHANICS AND THEORY OF SOLIDS

H.B. Callen, University of Pennsylvania, School of Arts & Sciences, Dept. of Physics, *34th & Spruce Sts., Philadelphia, Pennsylvania* 19104 (DMR76-21703 A02)

Research on the statistical mechanical properties of condensed matter carried out under NSF grant DMR72-03146 will be continued. Common to several aspects of this program is the use of renormalization-group techniques in phenomena other than thermodynamic phase transitions. In particular, such techniques will be used for studies of percolation, the theory of random systems, and the problem of turbulence. The latter, and the study of systems far from thermodynamic equilibrium, represents a new area of interest to be pursued during this grant period.

Further investigations using the renormalization group on the various liquid crystal phase transitions, and on phase transitions of surfaces, will be carried out.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0040, INELASTIC ELECTRON SCATTERING FROM SURFACE ADSORBATES

E.W. Plummer, University of Pennsylvania, School of Arts & Sciences, Dept. of Physics, *34th & Spruce Sts., Philadelphia, Pennsylvania* 19104 (DMR78-08520)

This is an extension of research previously supported by NSF grant DMR-7302656 A01.

Vibrational modes of atoms and molecules on solid surfaces will be studied using high resolution inelastic electron scattering. The mechanisms for the scattering of low-energy electrons from adsorbed complexes will be investigated in an attempt to observe short range molecular scattering. In this scattering mode all of the fundamental modes of the surface complexes can be observed. The identification of the fundamental vibrational modes will enable one to identify the bonding configurations of a surface atom or molecule. This information is important in understanding bonding and reactions at solid surfaces.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0041, MECHANISMS OF PORE, DISLOCATION AND PRECIPITATE NUCLEATION AND GROWTH DURING HIGH TEMPERATURE ION BOMBARDMENT

W.J. Choyke, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics & Astronomy, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (DMR78-02598)

Many metals subjected to atomic displacement damage exhibit complex microstructural changes not seen under normal thermal equilibrium conditions. In all cases the evolution of the microstructure involves competitive nucleation and growth processes which proceed by the diffusion and aggregation of point defects and impurities. While there is a large body of experimental data and theory which has been identified and examined in detail, the mechanisms of point defect diffusion and clustering at low temperatures and damage levels in many metals and alloys, the mechanisms at temperatures and atomic displacement levels of interest to the new fields of implantation metallurgy and simulation of fast neutron effects remain largely unexplored. The purpose of this program is to identify the mechanisms of diffusion and aggregation of point defects and impurities involved in the nucleation and growth of voids, dislocation loops and precipitates under ion bombardment at temperatures high enough for self-diffusion to occur. Two co-impinging beams of helium ions and silicon ions are used to simultaneously produce lattice damage and introduce an isoluble impurity. In single crystals of copper, molybdenum and polycrystalline type 304 stainless steel, ion channeling, anelastic relaxation and transmission electron microscopy measurements will be used to determine impurity site occupancy, nature of the impurity-point defect aggregates, and the kinetics of diffusion and precipitation. The mechanisms of diffusion and aggregation of point defects and impurities will be identified by reconciling the measured properties with nucleation and growth reaction rate theories. This is a continuation of research previously funded under NSF Grant DMR75-01032 A02. This is the first year of a three-year continuing grant.

8.0042, RADIATION PROBLEMS IN GENERAL RELATIVITY

A.I. Janis, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics & Astronomy, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (PHY78-13926)

Theoretical physics research will be done in the area of general relativity. The following is a brief summary of the main topics to be emphasized. 1) There will be continued study of the geometric properties of the four-complex dimensional space (H-space) of asymptotically shear-free null surfaces in asymptotically flat space-times and its relationship to twistor theory. Particular points to be worked on are: a) Generalization of the techniques to include Yang-Mills theory. b) To further explore the unusual theory of equations of motion (ponderomotive force laws) that seems to be emerging. c) To understand, more precisely, how to find the physical space which produced a given H-space. d) To find more explicit H-spaces. e) To study the wide class of two-dimensional real H-spaces. f) To generalize the Penrose twistor particle classification scheme to deformed twistor space. g) To study the use of hyperfunction theory and sheaf theory in the case of non-analytic solutions to field equations. 2) It is planned to study several aspects of angular momentum in general relativity. In particular these include the removal of the ambiguities in the definition of angular momentum and the difficult question of finding the relationship between the rotational motion of sources and the total angular momentum.

This work is a continuation of that currently supported under NSF grant PHY76-17253 AO1.

8.0043, TRANSIENT NUCLEAR MAGNETIC RESONANCE STUDY OF SOLIDS

I.J. Lowe, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (DMR78-15441)

Several solid-state physics experiments will be carried out using nuclear magnetic resonance (NMR). These include: (1) a continuation of the measurements of hydrogen diffusion in solids; (2) a continuation of line shape measurements in motionally narrowed solids such as NH4Cl and ice to better understand diffusive motion in solids; (3) a study of superionic conductors such as PbF2 to understand how the motion of the fluorine atoms is influenced by dopants. Measurements of various high pressure phases of ice will also be carried out.

This research was previously supported DMR-7622655.

This is the first year of a three-year continuing grant.

8.0044, CHARGE TRANSFER BETWEEN HYDROGEN BEAMS AND NOBLE GASES

H.R. Dawson, Angelo State University, School of Science, Dept. of Physics, *San Angelo, Texas* 76901 (AJ-497)

Absolute cross-sections for the transfer of electrons into the 3S, 3D and 3P states of atomic hydrogen produced by proton and deuteron impact on gaseous targets of N2O and CO have been measured over the energy range between 2.2 and 8.2 keV. Over this energy range the N2O exhibits cross-section of 8 times 10 to the minus 18th power/cm for both 3D and 3S state capture. Capture into the 3P state is too small to measure by this technique. These measurements are almost the same as those made in this laboratory for a CO2 target. For the same energy range the CO target exhibits cross-sections of 4.5 times 10 to the minus 18th power/cm, 3 times 10 to the minus 18th power/cm and 11 times 10 to the minus 18th power/cm for the 3S, 3D and 3P states, respectively. These results compare in magnitude with those measured in this laboratory for O2, H2 and N2 targets.

8.0045, GAS-SOLID INTERACTIONS AT SEMICONDUCTOR SURFACES

J.H. Lunsford, Texas A & M University, College Station Campus, School of Science, Dept. of Chemistry, *College Station, Texas* 77843 (CHE78-09811)

This project is in the Structural Chemistry and Thermodynamics program, in the subfield of surface chemistry and heterogeneous catalysis. Reactions of the oxygen ions, O, O2, O3, with adsorbed species on various substrates, both non-catalytic and catalytic, will be studied by electron paramagnetic resonance spectroscopy (EPR). The catalytic oxidation of hydrocarbons by N2O will be investigated. It is thought that these reactions may proceed via oxygen ion intermediates. Other experiments will be devoted to the formation of O ions from lattice oxide ions, and to the generation of O ions in supported niobium. The research will progress from known oxygen species to surface reactions, and finally, the catalytic processes. The EPR technique limits the range of surfaces which may be studied, but a number of metal oxide systems are suitable; these include some supported transition metal oxides.

This research is a continuation of that currently supported by Foundation Grant, CHE-7515456.

8.0046, AN EXPERIMENTAL STUDY OF SURFACE INTERFACES IN SOLIDS

D.G. Naugle, Texas A & M University, College Station Campus, School of Science, Dept. of Physics, *College Station, Texas* 77843 (A-514)

Measurements of the specific heat of thin foils of amorphous LaGa and LaAu alloys have been completed and provide a wealth of information. Values of the Debye temperature, electron-phonon coupling constant and the electronic density of states have been determined. Our measurements indicate that unlike most amorphous non-transition metals the electronic structure is not free electron-like and the strength of the electron-phonon interaction is intermediate. Variations in these properties with Ga or Au concentration suggest a change in the short range order at a concentration of about 24 in agreement with computer calculations based on the dense random packing model of the amorphous structure.

The specific heat of a bulk-like NiO powder with an average particle size of 1300 A and surface area of 7 sq. meters/gm land stated purity of 99.995% has been measured in the temperature range from 18K-300K. The results are in reasonably good agreement with and exhibit considerably less scatter than the high temperature measurements of Selz, et al. At lower temperatures the measured values are appreciably higher than those calculated by Thompson, et al., from inelastic neutron scattering. Estimates indicate that the discrepancy cannot be explained by size or surface effects.

8.0047, ENERGY GAP STUDIES IN THIN FILM SUPERCONDUCTORS

B.J. Marshall, Texas Tech University, School of Arts & Sciences, Dept. of Physics, *P.O. Box 4340, Lubbock, Texas* 79409 (D-170)

The interaction of surface acoustic waves with conduction electrons in thin film superconductors provides a method of determining the superconducting energy gaps in these thin films. A comparison of these energy gaps with the values previously obtained for the same materials in the bulk state provides one means of understanding the transition temperature enhancement in thin film superconductors.

The ultrasonic surface acoustic waves are generated by interdigital gratings plated onto both quartz and lithium niobate substrates. Thin films ranging from 100 A up to 10,000 A for Zn, Nb and Cd are presently being investigated. The material being studied is plated onto the substrate in the region between the sending and receiving interdigital gratings. This requires the surface wave to travel through the thin film resulting in energy being removed from the surface wave due to the electron-phonon interactions. By measuring the temperature dependence of this energy loss the superconducting energy gap can be calculated.

8.0049, TRANSITIONS AND ELECTRONIC PROPERTIES OF NON-CRYSTALLINE MATERIALS

J.C. Thompson, University of Texas, Austin Campus, School of Arts & Sciences, Dept. of Physics, *200 W. 21st, Austin, Texas* 78712 (F-145)

Studies of optical properties of molten alloys of Ga, In or Tl with Te are being extended to higher photon energies. The optical system is being rebuilt to permit the study of chemically reactive systems at higher temperatures. Data already obtained confirm the central role of the non-bonding pi electrons from Te in the semiconducting properties. Molecular clusters such as Ga2Te3, In2Te3, Tl2Te form with Ga-Te, In-Te, Tl-Te bonds and associated sigma bands.

A new, electrodeless Hall effect apparatus has been used to confirm the existence of mobility maximum in Na-NH3 solutions near 4 mole percent metal. While this excess mobility is associated with the phase separation and metal-nonmetal transition, no mechanism has yet been found. Li, K and Cs solutions do not show the excess.

Electrons have been photo-injected into NH3 from p-type Si and GaAs electrodes. The es level has therefore to be lower with respect to the vacuum in NH3 than in H2O. This suggests that the electron may enter the e8 bands level instead.

8.0050, ELECTRONIC STATES AT SURFACES OF SOLIDS

L. Kleinman, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Physics, *200 W. 21st St., Austin, Texas* 78712 (DMR77-21559)

Theoretical calculations of the electronic structure of transition metal surfaces will be performed. First, ab initio calculations of the energy bands of a thin film of paramagnetic iron will be carried to self-consistency. Secondly, parameterized LCAO calculations on thicker films will be done.

Also to be calculated is the photocurrent of each spin due to a single-step process involving the excitation of the electrons near the surface into time-reversed LEED states. The surface resonance in tungsten will be examined in order to settle the question of whether this experimental feature is due to a spin-orbit induced resonance or an ordinary surface state. Finally, using techniques developed for electron calculations, the phonon densities of states on stepped surfaces will be calculated.

Continuation of research supported by DMR73-02449 A02. This is the first year of a 3-year continuing grant.

8.0051, PHASE TRANSFORMATIONS IN THE SOLID STATE

W.D. McCormick, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Physics, *200 W. 21st St., Austin, Texas* 78712 (F-610)

We have measured, in separate experiments, the heat capacity of six single crystals of K2SnCl6, in the temperature range 250 K to 265 K. The masses of the samples varied from 9 to 147 mg. We found evidence for two structural phase transformations at 260.5 plus or minus 0.5 K and 253.5 plus or minus 1.0 K. The temperature variability indicated was from sample to sample. Both transitions were found to be first order: the upper transition having a substantial latent heat, and the lower transition being nearly second order with a very small latent heat. We were able to confirm the presence of the lower of these two phase transitions, the existence of which has been somewhat controversial, even though the total height of the heat capacity anomaly associated with it was only about 2%. This was because, with the 'microcalorimetric' heat capacity technique developed under this grant, we were able to achieve a resolution of about plus or minus 0.1%, even with these very small samples.

8.0052, PROPERTIES OF DILUTE MAGNETIC ALLOYS AT VERY LOW TEMPERATURES AND NUCLEAR COOLING

O.G. Symko, Utah Higher Education System, University of Utah, School of Letters & Science, Dept. of Physics, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (DMR76-21702 A01)

Experimental studies of dilute magnetic impurities at very low temperatures previously supported by NSF grant DMR71-01802 will be continued. The interest is in the behavior of transition-metal impurities in a non-magnetic metal host. Such impurities will interact strongly with their surroundings, and in particular they will interact with the crystalline field produced by the surrounding ions and conduction electrons, with the conduction electrons, and with the other impurities; also, hyperfine interactions and a spin-compensated Kondo state can exist. These effects will be studied by measuring the magnetization as a function of temperature in the following alloys: Zn-Cr, Mg-Mn, Au-Mn, and Cu-Cr. As impurity-impurity interactions are quite strong, it will be necessary to go to very low impurity concentrations to observe some of the above mentioned single-impurity effects. The latter tend to be weak and hence low temperatures are necessary to reduce the thermal energy kT. A nuclear cooling apparatus together with a SQUID magnetometer will be used to study the ground-state behavior of some of the above alloys and nuclear quadrupole interactions in metals.

8.0054, THE RESPONSE OF THE HIGH LATITUDE IONOSPHERE TO CONVECTION ELECTRIC FIELDS

W.J. Raitt, Utah Higher Education System, Utah State University, School of Science, Dept. of Physics, *Main Bldg., Office 104, Logan, Utah* 84321 (DF582300; F19628-79-C-0025)

AF function - surveillance, communication, navigation. Deficiency - inadequate knowledge of plasma flows, charge distributions, electric fields for the design needs of AF systems. Objective - study high latitude ionospheric dynamics in three areas - 1. High latitude f region dynamics. 2. Convection electrodynamics. 3. Polar cap plasma chemistry and dynamics. How research contributes - provides data essential to HF and UHF propagation predictions, provides data required for the design and utilization of communication guidance and surveillance systems and provides understanding of the dynamical processes in the ionosphere.

Develop theoretical procedures and computer codes to determine plasma flow, particle distributions and effects of electric fields on the high latitude ionosphere. Satellite data will be utilized to test the theoretical methods and to develop a prediction capability for the high latitude ionosphere.

8.0055, INELASTIC ELECTRON AND SOFT X-RAY SPECTROSCOPY

S.E. Schnatterly, University of Virginia, School of Engineering & Applied Science, Dept. of Physics, *Garrett Hall, Charlottesville, Virginia* 22903 (DMR78-16753)

Experimental studies of the electronic structure and excitations in solids which previously were supported by NSF grant DMR-7721709 will be continued. Two research areas will be addressed. The first area is concerned with electron energy loss phenomena in solids. The inelastic electron scattering spectrometer previously built with NSF support will be reassembled with improvements in design at the University of Virginia. Experimental studies of X-ray thresholds, absorption edge fine structure, atomic plasmons and core excitons will be carried out using this technique. An improved understanding of these effects will provide a basis for testing the validity of current theories for single particle and collective excitations in solids. The second area of research is concerned with soft X-ray spectroscopy. An emission spectrometer is being designed and constructed which should have a significant increase in sensitivity over equipment currently available. Experiments using this technique will be carried out to complement the electron scattering experiments. Also, the application of this technique to experimental studies of surface phenomena will be investigated.

This is the first year of a three-year continuing grant.

10.0001, MICROMETRIC MEASURES OF VISUAL DOUBLE STARS

F. Holden, (No Performing Organization Reported), *California* (AST77-00249 A01)

Support for an additional year will allow continuation of measures, with bifilar micrometers, of visual double stars in California, Chile, and Venezuela. The 36-inch refractor of Lick Observatory will be again available and, in the northern winter when California does not have its best seeing, measures will be made in Chile and Venezuela. The southern observatories of Cerro Tololo and Las Campanas will be visited and also the C.I.D.A. Observatory near Merida, Venezuela, to extend the observations through both hemispheres of the sky.

Double stars are important because they are more numerous than single stars in our galaxy and from their orbital motions information about stellar masses is obtained.

Previous support was by NSF grant AST 77-00249.

10.0003, DETECTION, SPECTROSCOPY AND PHYSICAL STUDY OF RADIO GALAXIES AT LARGE RED SHIFTS

H. Spinrad, University of California, Berkeley Campus, School of Letters & Science, Dept. of Astronomy, *Berkeley, California* 94720 (AST77-26897)

The main research objective is to study the evolution of galaxies at large red shifts (and long look-back times), and to constrain current cosmological models by means of optical observations of distant radio and cluster galaxies. The procedures require detection of limiting (V greater than or equal to 23) galaxies (radio sources or cluster members), followed up by (presently) lengthy and difficult spectrophotometry. This research then yields a red shift and color-evolution data. In a few cases, galaxy surface-brightnesses and isophotal diameters will be measured; such data will be utilized for an evaluation of galaxian luminosity evolution, if qo (the deceleration parameter) can be independently fixed. Finally the probable content of a sample of faint field galaxies will be discussed.

This is a continuation of research done under grant AST 72-05061 A04.

10.0004, MEASUREMENT OF ATMOSPHERIC CONSTITUENT PROFILES USING THE SOLAR SPECTRUM AND THE ATMOSPHERIC EMISSION SPECTRUM IN THE INFRARED

D.G. Murcray, University of Denver, School of Arts & Sciences, Dept. of Physics & Astronomy, *2115 S. University Blvd., Denver, Colorado* 80210 (ATM77-27633)

One of the major problems of the chemistry of the stratospheric ozone layer is the lack of data on the altitude distribution of many chemical species of interest. A significant number of molecules predicted to be present in the stratosphere and to play key roles in ozone chemistry have not been directly detected at all. Many such molecules have infrared absorption bands. The objective of this research is to detect and to determine altitude distributions of trace chemical species in the stratosphere in a series of balloon-borne experiments that utilize infrared absorption and emission as the basis for detection.

Two different types of instruments will be flown under this program: (1) a solar tracking system coupled to an infrared in-

terferometer to obtain solar absorption spectra at a resolution of 0.01/cm as a function of altitude and from float altitude at sunset, and (2) an ultrasensitive spectrometer system to measure radiation emitted by the atmosphere at various altitudes up to the balloon float altitude. Absorption studies offer superior spectral resolution for sensitive and accurate identification of the molecules present in the atmosphere. Emission experiments offer increased dynamic range and the ability to detect atmospheric species at any time of day and thereby measure important diurnal variation.

Previous balloon-borne infrared experiments have been highly successful in detecting many important stratospheric species for the first time. The substantially improved infrared absorption instrumentation to be flown under this grant shows considerable promise of achieving detection and measurement of several key species for which only upper limits on concentrations have been determined previously, thereby achieving a major improvement in chemical understanding of the stratosphere. The emission experiment should achieve significant results on the concentrations of important species, such as N2O5, that are believed to reach maximum concentration at night.

10.0005, OBSERVATIONAL STUDIES OF MASS EXCHANGE BETWEEN STARS AND DIFFUSE MATTER IN GALAXIES AND ACTIVE BINARY SYSTEMS

J.S. Gallagher, University of Illinois, Urbana Champaign Campus, School of Arts & Sciences, Dept. of Astronomy, *Urbana, Illinois* 61801 (AST77-18270)

Observational studies concerning interrelationships between stars and diffuse matter is presented. The research will primarily be divided between two major areas: 1. Cataclysmic Variable Stars. An emphasis will be placed on classical novae and on variable stars which share physical characteristics with novae. Specific problems will include evolution of the ejecta, abundances, and mass exchange in active binaries. 2. Optical structural characteristics of E, SO, and IO galaxies. Detailed information on internal structure and dynamics as well as the distribution of stellar populations will be needed for representative sample galaxies in order to properly assess variable atom hydrogen (HI) content in early-type galaxies. A program of optical spectrophotometry and direct broad-band and image intensifier H alpha photography has been chosen for the initial stages of this work.

10.0006, IONIZATION MODELS OF HIGH EXCITATION PLANETARY NEBULAE

J.P. Harrington, University of Maryland, College Park Campus, School of Engineering, Dept. of Physics & Astronomy, *College Park, Maryland* 20742 (AST78-07490)

This research will involve the construction of detailed ionization models of high-excitation planetary nebulae, with particular emphasis upon the interpretation of satellite ultraviolet observations. The purpose of this work will be to obtain estimates of the abundances of carbon, nitrogen and oxygen in these objects. This is important to our understanding of the carbon-nitrogen-oxygen cycle and helium-burning nucleosynthesis taking place in stars which become planetary nebulae.

In addition to the requirement of high-quality visual data, the nebulae chosen for modelling will be selected among those scheduled for early observation by the International Ultraviolet Explorer spacecraft. The modelling approach to be adopted is the only good method available for the analysis of the ultraviolet lines of carbon and other elements.

10.0007, IONOSPHERIC VARIABILITY

M.J. Mendillo, Boston University, School of Liberal Arts, Dept. of Astronomy, *755 Commonwealth Ave., Boston, Massachusetts* 02215 (DF249900; F19628-77-C-0270)

AF function - radio frequency ranging systems for navigation and satellite detection and tracking. Deficiency - monthly average models are available for correcting for the effects of the earth's ionosphere on the velocity of radio waves. However, on a day-to-day basis, the models have errors of up to 25 percent rms. The effect on the ionosphere of large magnetic storms has been studied, and can be corrected for to first order. Other variations occur which are not yet understood yet cause large errors from average conditions. Objective - study the day-to-day variability of the ionospheric f region to develop algorithms to improve models of ionospheric time delay. How research contributes -results will improve existing models of the time delay to operational radar and navigation systems, and will require the use of fewer monitoring stations to update ionospheric conditions.

The ionosphere has an approximate 25 percent variability from monthly average conditions. The contractual approach to study this variability will be to find relationships with other geophysical parameters which correlate with ionospheric parameters such as total electron content and NMAX after the effects of magnetic storms have been carefully removed from the data. Also, power spectral analyses will be done to determine the predominant spectral features of the temporal behavior and its repeatability. Some model studies will be undertaken to determine the effects of changes in neutral winds, electric fields and auroral heating on the day-to-day variability of the f region.

10.0009, STUDIES IN THE MATHEMATICAL THEORY OF GLOBAL CLIMATE

G.R. North, University of Missouri, St. Louis Campus, School of Arts & Sciences, Dept. of Physics, *8001 Natural Bridge Rd., St. Louis, Missouri* 63121 (ATM78-07962)

This project is a two-year continuation of the analytical study of simple climate models. Certain features of these models have been established such as multiple branch solutions, stability theory and estimates of sensitivity under specific assumptions. Further work needs to be done to provide a guide or reference line for larger model studies. Proposed work includes: the extension of a stationary perturbation theory which predicts the change in large-scale climate due to infinitesimal external changes (such as CO2 concentration); the extension of a variational principle to larger classes of models; the extension of a simple seasonal model to include climate change with ice feedback; the study of fluctuations in model solutions due to various stochastic inputs; and the extension of the simple terrestrial models to the example of the planet Mars.

10.0010, ULTRAVIOLET AND X-RAY BOMBARDMENT OF PLANETARY ATMOSPHERES

J.A. Samson, University of Nebraska, Lincoln Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *Lincoln, Nebraska* 68508 (ATM78-05702)

The interaction of solar radiation with a planet's atmosphere depends critically upon the wavelength of the incident radiation. The energetic radiation below 2000 A causes dissociation, ionization, and dissociative ionization of atmospheric molecules. The resulting molecular fragments react with ambient species to form a source of new molecules in the atmosphere, while the ionic fragments are the starting species in ionospheric chemistry. The objective of this research is to investigate the interaction of solar ultraviolet radiation with planetary atmospheres and to provide cross-sections for specific interactions as functions of wavelength in the interval 100-1400 A. The techniques used in the study include measurement of kinetic energies of ejected photoelectrons (photoelectron spectroscopy) and of ionic species with a mass spectrometer.

10.0013, THEORY OF GRAVITATION

J.W. York, University of North Carolina, Chapel Hill Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *Chapel Hill, North Carolina* 27514 (PHY76-83252)

Research initiated under NSF grant PHY74-14191 A04 will be continued. This project deals primarily with the dynamics of gravitational fields according to the general theory of relativity. The principal feature of the analysis is that it is based on the conclusions that have been reached from a comprehensive analysis, using conformal methods, of the initial-value equations, which form the foundation of the dynamical structure. In particular, the following topics will be investigated: 1. The space of degrees of freedom of asymptotically flat gravitational fields. 2. The natural kinematical gauge conditions that are suggested by the conformal analysis of the initial-value problem. The 'minimal coordinate shear' condition is of particular interest in regard to the evolution of Cauchy data, and the explicit characterization of gravity waves on space-like slices. 3. Incorporation of the constraint equations and the above gauge conditions into the Hamiltonian form of classical general relativity. 4. Implications of the above results for a quantum theory of gravity. 5. Continuation of work on numerical construction of initial data for calculation of astrophysical interest.

10.0014, CONSTRUCTION AND INSTALLATION OF A REMOTELY CONTROLLED CASSEGRAIN SPECTROGRAPH SYSTEM FOR THE MCDONALD OBSERVATORY 2.7-METER TELESCOPE

H.J. Smith, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Astronomy, *200 W. 21st St., Austin, Texas* 78712 (AST76-23326)

A Cassegrain spectrograph system will be constructed and installed at the 2.7-meter (107-inch) telescope of the McDonald Observatory of the University of Texas. The design of this system will be modelled on the automated Miller spectrograph at the Lick Observatory of the University of California. The system will consist of four major parts: (1) the telescope utility bench, which will support the spectrograph, detector calibration lamps and the television guiding system; (2) the Cassegrain spectrograph; (3) the detector system, and (4) the read-out and data handling system.

Actual construction of most of the parts of the system will be carried out at the McDonald Observatory Shop, located at the Bee Caves Research Center and Observatory. Construction should take approximately one year. Installation and operation will begin in the second year.

Scientific projects that will make use of the new spectrograph will cover many areas of astrophysics: radio galaxies, galaxies in clusters, quasi-stellar objects, time-resolved spectroscopy of rapidly varying stellar sources such as cataclysmic binaries, variable white dwarf stars, dwarf cepheids, and flare stars.

10.0015, A STUDY OF STRATOSPHERIC AEROSOL SOURCES, FORMATION PROCESSES AND ROLE AS A SINK FOR TRACE GASES

D.J. Hofmann, University of Wyoming, School of Arts & Sciences, Dept. of Physics & Astronomy, *P.O. Box 3435, University Station, Laramie, Wyoming* 82070 (ATM77-27552)

This action funds the study of the nature and importance of the stratospheric sulfate aerosol layer in terms of defining the source, investigating aerosol formation processes and investigating the importance of transport processes. These research goals will be sought by conducting stratospheric balloon soundings of ozone, r greater than or equal to 0.15 micron, aerosol r greater than or equal to 0.01 micron condensation nuclei and by observing the vaporization point of the volatile aerosol in the sulfate layer over Laramie, Wyoming. Major emphasis will be placed on continuing monthly aerosol soundings at Laramie as have been done in the past year, to attempt to sort out volcanic and transport effects. In studying transport phenomena, ozone measurements are important as another tracer of equatorial air. Laboratory studies of ozone sensors will continue in hopes that a chemiluminescent detector can be suitably calibrated prior to balloon launch so the absolute as well as relative ozone data can be obtained. Continued research on the condensation nuclei counter is necessary to improve its high-altitude response. Some of this work should be done this summer along with additional aerosol vaporization measurements. To increase the versatility of balloon platforms for stratospheric research, work will proceed on developing small multi-balloon systems wherein the number of balloons is varied to obtain different float altitudes and developing radio command capabilities so that the experimenter can control his experiment from the ground. Related work funded by the Office of Naval Research and the Army Research Office will be coordinated with this effort.

DEVELOPMENT OF TEST METHODS FOR SCALE MODEL SIMULATION OF AERIAL APPLICATIONS IN THE NASA LANGLEY VORTEX RESEARCH FACILITY
Frank L. Jordan, Jr. Apr. 1980 17 p refs Presented at the AIAA 11th Aerodyn. Testing Conf., Colorado Springs, Colo., 18-20 Mar. 1980
(NASA-TM-81805) Avail: NTIS HC A02/MF A01 CSCL 01B

As part of basic research to improve aerial applications technology, methods were developed at the Langley Vortex Research Facility to simulate and measure deposition patterns of aerially-applied sprays and granular materials by means of tests with small-scale models of agricultural aircraft and dynamically-scaled test particles. Interactions between the aircraft wake and the dispersed particles are being studied with the objective of modifying wake characteristics and dispersal techniques to increase swath width, improve deposition pattern uniformity, and minimize drift. The particle scaling analysis, test methods for particle dispersal from the model aircraft, visualization of particle trajectories, and measurement and computer analysis of test deposition patterns are described. An experimental validation of the scaling analysis and test results that indicate improved control of chemical drift by use of winglets are presented to demonstrate test methods. A.R.H.

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

THEORY FOR COMPUTING THE SIZE AND SHAPE OF A REGION OF INFLUENCE ASSOCIATED WITH A MANEUVERING VEHICLE
Raymond L. Barger May 1980 22 p refs
(NASA-TP-1648; L-13419) Avail: NTIS HC A02/MF A01 CSCL 01A

A general procedure for computing the region of influence of a maneuvering vehicle is described. Basic differential geometric relations, including the use of a general trajectory parameter and the introduction of auxiliary variables in the envelope theory are presented. To illustrate the application of the method, the destruct region for a maneuvering fighter firing missiles is computed. Author

COMPARISON OF CALCULATED AND MEASURED MODEL ROTOR LOADING AND WAKE GEOMETRY
Wayne Johnson Apr. 1980 34 p refs Prepared in cooperation with Army Research and Technology Labs., Moffett Field, Calif.
(NASA-TM-81189; AVRADCOM-TR-80-A-4; A-8149) Avail: NTIS HC A03/MF A01 CSCL 01A

The calculated blade bound circulation and wake geometry are compared with measured results for a model helicopter rotor in hover and forward flight. Hover results are presented for rectangular tip and ogee tip planform blades. The correlation is quite good when the measured wake geometry characteristics are used in the analysis. Available prescribed wake geometry models are found to give fair predictions of the loading, but they do not produce a reasonable prediction of the induced power. Forward flight results are presented for twisted and untwisted blades. Fair correlation between measurements and calculations is found for the bound circulation distribution on the advancing side. The tip vortex geometry in the vicinity of the advancing blade in forward flight was predicted well by the free wake calculation used, although the wake geometry did not have a significant influence on the calculated loading and performance for the cases considered. Author

EXPERIMENTAL INVESTIGATION OF A 0.15 SCALE MODEL OF A CONFORMAL VARIABLE-RAMP INLET FOR THE F-16 AIRPLANE Final Report
J. E. Hawkins Mar. 1980 219 p refs Sponsored by NASA
(NASA-CR-159640; ERR-FW-2014) Avail: NTIS HC A10/MF A01 CSCL 01A

A 0.15 scale model of a proposed conformal variable-ramp inlet for the Multirole Fighter was tested from Mach 0.8 to 2.2 at a wide range of angles of attack and sideslip. Inlet ramp angle was varied to optimize ramp angle as a function of engine airflow, Mach number, angle of attack, and angle of sideslip. Several inlet configuration options were investigated to study their effects on inlet operation and to establish the final flight configuration. These variations were cowl sidewall cutback, cowl lip bluntness, boundary layer bleed, and first-ramp leading edge shape. Diagnostic and engine face instrumentation were used to evaluate inlet operation at various inlet stations and at the inlet/engine interface. Pressure recovery and stability of the inlet were satisfactory for the proposed application. On the basis of an engine stability audit of the worst-case instantaneous distortion patterns, no inlet/engine compatibility problems are expected for normal operations. Author

EFFECTS OF FREE-STREAM TURBULENCE ON DIFFUSER PERFORMANCE
Jon A. Hoffmann. Jun. 1980. 51 p. refs.
(Grant NsG-2391)
(NASA-CR-163194) Avail: NTIS. HC A04/MF A01. CSCL 01A

An experimental evaluation of the effects of free stream turbulence on the performance of a subsonic two dimensional diffuser was made. The diffuser's static pressure recovery coefficient was increased 11.4 and 21.1 percent at total. Divergence angles of 12 and 20 degrees respectively were obtained when the value of the inlet integral free stream scale of turbulence in the flow direction was at least 7.5 times larger than the inlet boundary layer displacement thickness, and when the inlet total free stream turbulence intensity was at least 3.5 percent. It is hypothesized that a larger scale of turbulence transmits the free stream energy to the wall more effectively and when coupled with large turbulence intensities, acts to decrease the distortion and delay separation within the diffuser. EFFECT OF CONVENTIONAL AND SQUARE STORES ON THE LONGITUDINAL AERODYNAMIC CHARACTERISTICS OF A FIGHTER AIRCRAFT MODEL AT SUPERSONIC SPEEDS
William J. Monta. Jun. 1980. 59 p. refs.
(NASA-TM-81791; L-13402) Avail: NTIS. HC A04/MF A01. CSCL 01A

The effects of conventional and square stores on the longitudinal aerodynamic characteristics of a fighter aircraft configuration at Mach numbers of 1.6, 1.8, and 2.0 was investigated. Five conventional store configurations and six arrangements of a square store configuration were studied. All configurations of the stores produced small, positive increments in the pitching moment throughout the angle-of-attack range, but the configuration with area ruled wing tanks also had a slight decrease on stability at the higher angles of attack. There were some small changes in lift coefficient because of the addition of the stores, causing the drag increment to vary with the lift coefficient. As a result, there were corresponding changes in the increments of the maximum lift drag ratios. The store drag coefficient based on the cross sectional area of the stores ranged from a maximum of 1.1 for the configuration with three Maverick missiles to a minimum of about .040 for the two MK-84 bombs and the arrangements with four square stores touching or two square stores in tandem. Square stores located side by side yielded about 0.50 in the aft position compared to 0.74 in the forward position. R.E.S.

INVESTIGATION OF AXISYMMETRIC AND NONAXISYMMETRIC NOZZLES INSTALLED ON A 0.10 SCALE F-18 PROTOTYPE AIRPLANE MODEL
Francis J. Capone and Bobby L. Berrier. Jun. 1980. 304 p. refs.
(NASA-TP-1638; L-13401) Avail: NTIS. HC A14/MF A01. CSCL 01A

The Langley 16 foot transonic tunnel was used to investigate the afterbody/nozzle longitudinal aerodynamic characteristics of three different two dimensional nozzles and a base-line axisymmetric nozzle installed on a 0.10 scale model of the F-18 airplane. The effects of thrust vectoring and in-flight thrust reversing were also studied. Horizontal-tail deflections of 0 deg, -2 deg, and -5 deg were tested. Test data were obtained at static conditions and at Mach numbers from 0.60 to 1.20 over an angle-of-attack range from -2 deg to 10 deg. Nozzle pressure ratio was varied from jet off to about 10. A.R.H.

A GENERAL PANEL METHOD FOR THE ANALYSIS AND DESIGN OF ARBITRARY CONFIGURATIONS IN INCOMPRESSIBLE FLOWS Final Report
Forrester T. Johnson. Washington: NASA. May 1980. 200 p. refs.
(Contract NAS2-7729)
(NASA-CR-3079; D6-43808) Avail: NTIS. HC A09/MF A01. CSCL 01A

A method for solving the linear integral equations of incompressible potential flow in three dimensions is presented. Both analysis (Neumann) and design (Dirichlet) boundary conditions are treated in a unified approach to the general flow problem. The method is an influence coefficient scheme which employs source and doublet panels as boundary surfaces. Curved panels possessing singularity strengths, which vary as polynomials are used, and all influence coefficients are derived in closed form. These and other features combine to produce an efficient scheme which is not only versatile but eminently suited to the practical realities of a user-oriented environment. A wide variety of numerical results demonstrating the method is presented. Author

SIMPLE TURBULENCE MODELS AND THEIR APPLICATION TO BOUNDARY LAYER SEPARATION Final Report
Alan J. Wadcock. Washington: NASA. May 1980. 71 p. refs.
(Contract NAS2-10093)
(NASA-CR-3283) Avail: NTIS. HC A04/MF A01. CSCL 01A

Measurements in the boundary layer and wake of a stalled airfoil are presented in two coordinate systems, one aligned with the airfoil chord, the other being conventional boundary layer coordinates. The NACA 4412 airfoil is studied at a single angle of attack corresponding to maximum lift, the Reynolds number based on chord being 1.5 x 10 to the 6th power. Turbulent boundary layer separation occurred at the 85 percent chord position. The two-dimensionality of the flow was documented and the momentum integral equation studied to illustrate the importance of turbulence contributions as separation is approached. The assumptions of simple eddy-viscosity and mixing-length turbulence models are checked directly against experiment. Curvature effects are found to be important as separation is approached. Author

FURTHER INVESTIGATION OF A FINITE DIFFERENCE PROCEDURE FOR ANALYZING THE TRANSONIC FLOW

ABOUT HARMONICALLY OSCILLATING AIRFOILS AND WINGS Final Report
W. H. Weatherill, F. E. Ehlers, E. Yip, and J. D. Sebastian. Washington NASA May 1980 83 p refs
(Contract NAS1-15128)
(NASA-CR-3195; D-48851) Avail: NTIS HC A05/MF A01 CSCL 01A

Analytical and empirical studies of a finite difference method for the solution of the transonic flow about harmonically oscillating wings and airfoils are presented. The procedure is based on separating the velocity potential into steady and unsteady parts and linearizing the resulting unsteady equations for small disturbances. The steady velocity potential is obtained first from the well-known nonlinear equation for steady transonic flow. The unsteady velocity potential is then obtained from a linear differential equation in complex form with spatially varying coefficients. Since sinusoidal motion is assumed, the unsteady equation is independent of time. An out-of-core direct solution procedure was developed and applied to two-dimensional sections. Results are presented for a section of vanishing thickness in subsonic flow and an NACA 64A006 airfoil in supersonic flow. Good correlation is obtained in the first case at values of Mach number and reduced frequency of direct interest in flutter analyses. Reasonable results are obtained in the second case. Comparisons of two-dimensional finite difference solutions with exact analytic solutions indicate that the accuracy of the difference solution is dependent on the boundary conditions used on the outer boundaries. Homogeneous boundary conditions on the mesh edges that yield complex eigenvalues give the most accurate finite difference solutions. The plane outgoing wave boundary conditions meet these requirements. Author

COHERENT SUBSTRUCTURE OF TURBULENCE NEAR THE STAGNATION ZONE OF A BLUFF BODY
Willy Z. Sadeh and Herbert J. Brauer. 1980 13 p refs Presented at the 4th Colloq. on Ind. Aerodyn., Aachen, West Germany, 18-20 Jun. 1980
(Grant NsG-3127)
(NASA-CR-163191) Avail: NTIS HC A02/MF A01 CSCL 01A

The evolution of freestream turbulence in crossflow about a circular cylinder was studied in order to indentify the existence of a coherent substructure which is the outcome of the amplification of freestream turbulence by the stretching mechanism in diverging flow about a bluff body. Visualization of the flow events revealed the selective stretching of cross-vortex tubes and the emergence of an organized turbulent flow pattern near the cylinder stagnation zone. Significant amplification of the total turbulent energy of the streamwise fluctuating velocity was consistently monitored. Realization of selective amplification at scales larger than the neutral scale of the stagnation flow was indicated by the variation of the discrete streamwise turbulent energy. A most amplified scale, characteristic of the energy containing eddies within the coherent substracture and commensurate with the boundary-layer thickness, was detected. Penetration of the amplified turbulence into the cylinder boundary layer led to the retardation of separation and to a concurrent decrease in the drag coefficient at subcritical cylinder-diameter Reynolds numbers. A.R.H.

N80-24273*# Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
A DRY-SURFACE COATING METHOD FOR VISUALIZATION OF SEPARATION
W. Z. Sadeh, H. J. Brauer, and J. R. Durgin. 1980 6 p refs Presented at the Intern. Symp. on Flow Visualization, Bochum, West Germany, 9-12 Sep. 1980
(Grant NsG-3127)
(NASA-CR-163192) Avail: NTIS HC A02/MF A01 CSCL 01A

A relatively simple and reasonably accurate dry-surface coating method for visualization of the separation line on a bluff body was devised and successfully tested. This technique is based on the color reaction of a dry film containing a pH indicator with an appropriate gas released in the body wake. The dry-surface coating method is effective at any Reynolds number and for both incident laminar and turbulent flows. It further supplies a colorful permanent of consistently good photographic quality of the separation line. The effectiveness and accuracy of this technique were tested in visualizing the separation angle on a circular cylinder in both laminar and turbulent crossflows at subcritical Reynolds numbers. Separation angles revealed by the visualization were within + or - 4 percent of their counterparts deduced from the mean wall pressure distribution. Author

N80-24274# Raytheon Co., Bedford, Mass. Missile Systems Div.
GUIDANCE SUBSYSTEMS WITH POSITION MEASUREMENT FOR GLIDING AIRDROP SYSTEMS Final Report, 13 Jan. - 25 Aug. 1978
C. F. Olenberger. Natick, Mass. Army Natick Res. and Develop. Command Aug. 1978 173 p refs
(Contract DAAK60-78-C-0022; DA Proj. 1L1-62210-D-283)
(AD-A080730; BR-10606; NATICK/TR-79/016) Avail: NTIS HC A08/MF A01 CSCL 01/3

The objective of this work has been to assess guidance techniques and available hardware which are suitable for gliding airdrop systems. Information presented indicates the suitability of available hardware for measuring required flight data, processing these data according to one of several alternative guidance schemes and activating control lines as required to guide a gliding airdrop system. N80-24275# Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.
A DIAGNOSTIC STUDY OF FLOW IN THE WAKE OF A CIRCULAR DISK USING A PHOTON CORRELATION LASER VELOCIMETER M.S. Thesis
Steven L. Morris. Mar. 1980 200 p refs
(AD-A082167; AFIT/GAE/AA/79D-12) Avail: NTIS HC A09/MF A01 CSCL 20/5

The present investigation involves a diagnostic study of flow in the wake of a circular disk utilizing schlieren photography and a photon correlation laser velocimeter system (LDV). The schlieren system was used to examine the basic flow pattern over a 2.0 inch diameter disk and to establish the bounds of the recirculation zone. In all tests, the flow originated from a 1.5 inch diameter axially symmetric free jet with an exit Mach number of 0.35. The disk was positioned in the flow 12 jet diameters downstream of the exit. Mean velocity and turbulence intensity profiles were measured at selected locations in the near wake region of the 2.0 and a 1.5 inch diameter disk with the LDV system. This was accomplished without particle seeding of the flow. A free jet survey was conducted for comparison with theoretical predictions to analyze the quality of the LDV data. The schlieren system produced high quality photographs from which the dimensions of the recirculation zone were obtained. Mean velocity and turbulence intensity profiles were acquired at the varied stream-wise locations behind each disk with the LDV system. The laser velocimeter system, when used in conjunction with a phase modulator, clearly indentified the flow direction. Bounds of the recirculation zone found from the LDV study agreed with the results of the schlieren study. GRA

CAPTURE OF AN AXISYMMETRIC FREE JET IN A PIPE WITH APPLICATION TO POWER-AUGMENTED-RAM WING THEORY
Harvey R. Chaplin, Earl F. McCabe, Jr., Harry A. Berman, and William J. H. Smithey. Dec. 1979 18 p refs
(ZF43411210)
(AD-A082241; DTNSRDC/ASED-79/12) Avail: NTIS HC A02/MF A01 CSCL 20/4

A theory of the two dimensional power augmented ram wing with turbulent jets was previously validated over a range of experimental conditions which did not include very small ratios of jet nozzle area to capture area. In the present investigation a simple axisymmetric experiment was conducted to evaluate this condition. Results indicate that the original theory should provide useful predictions regardless of nozzle area ratio. GRA

AN INVESTIGATION OF THE PERFORMANCE OF A MOTORCYCLE FAIRING B.S. Thesis
P. E. Freathy and J. D. Potter Jun. 1979 43 p refs
(BU-231) Avail: NTIS HC A03/MF A01

The addition of strakes to the fairing of a racing motorcycle to improve handling and stability by decreasing front wheel lift was studied. A full size Suzuki 500 motorcycle was adapted to accept a Yamaha racing fairing and a 1/9th scale model of the Yamaha motorcycle was used in the wind tunnel for force measurements. Flow visualization was used to compare the full scale flow to that over the model. A theoretical analysis of stability was also performed. It was found that the strakes could greatly reduce the lift with no consequent drag penalty. There were no unexpected disturbances in the flow, although one separation line, emanating from the handlebars on the model was not found on the full scale machine. Problems encountered during the course of this project are in included. Author (ESA)

WIND TUNNEL MEASUREMENTS OF THE MEAN FLOW IN THE TURBULENT BOUNDARY LAYER AND WAKE IN THE REGION OF THE TRAILING EDGE OF A SWEPT WING AT SUBSONIC SPEEDS
P. H. Cook, M. A. McDonald, and M. C. P. Firmin London HMSO Jun. 1979 185 p refs
(RAE-TR-79062; RAE-Aero-3457; BR71526) Avail: NTIS HC A09/MF A01

Measurements were made of the distributions of local Mach number, flow direction, and static pressure coefficient through the wake and boundary layers of a wing of constant chord (0.61 m normal to the leading edge) and RAE 101 section at sweep angles of 20 deg and 28 deg. The model spanned the 1.8 m (6 ft) dimension of the wind tunnel working section and was set at incidences in the range of + or - 1.88 deg. Tests were made at free stream Mach numbers in the range 0.43 to 0.76 and Reynolds numbers of 7 to 11 x 1,000,000. The technique of measurements, using calibrated minature three-hole yawmeters, is described and the experimental results are compared with an integral boundary layer calculation method. Some comparisons are also made with previous tests at zero sweepback. Results indicate that useful data on the behavior of three-dimensional layers and wakes can be obtained by this technique.

AIRCRAFT ACCIDENT REPORT: THURMAN L. MUNSON, CESSNA CITATION 501, N15NY, NEAR CANTON, OHIO, AUGUST 2, 1979
16 Apr. 1980 29 p
(NTSB-AAR-80-2) Avail: NTIS HC A03/MF A01

The findings of an investigation of the Cessna Citation 501 accident are presented and analyzed. The probable cause of the accident was the pilot's failure to recognize the need for, and to take action to maintain sufficient airspeed to prevent a stall into the ground during an attempted landing. The pilot also failed to recognize the need for timely and sufficient power application to prevent the stall during an approach conducted inadvertently without flaps extended. Contributing to the pilot's inability to recognize the problem and to take proper action was his failure to use the appropriate checklist and his nonstandard pattern procedures which resulted in an abnormal approach profile. POSTCRASH FUEL FIRE HAZARD MEASUREMENTS IN A WIDE-BODY AIRCRAFT CABIN Final Report, Mar. 1977 - Dec. 1978
Richard G. Hill, George R. Johnson, and Constantine P. Sarkos Dec. 1979 92 p refs Original contains color illustrations
(FAA Proj. 181-521-100)
(AD-A079548; FAA-NA-79-42) Avail: NTIS HC A05/MF A01 CSCL 01/3

Results obtained utilizing a full-scale, wide-body test article for studying postcrash cabin hazards produced by an external fuel fire adjacent to a cabin door opening are described. Seventy-two tests were conducted at various ambient wind conditions and fire sizes in a fire-hardened cabin devoid of interior materials. Temporal data, taken at a large number of cabin locations, are presented and discussed pertaining to the effect of ambient wind on the rate of hazard accumulation inside of the cabin; stratification of heat, smoke, and toxic gases; the effect of fire size of thermal radiation through the opening; and the relative importance of heat, smoke, and carbon monoxide in a fuel-dominant fire. It is concluded that major stratification of hazards occurs in the cabin when the hazards are created by an external fuel fire, and that ambient wind determines the amount of hazards entering a cabin due to a given fuel fire. M.G.

ADVANCED CONCEPT IN AIRCRAFT CRASH FIREFIGHTING USING CARBON TETRAFLUORIDE Final Report, Oct. 1977 - Jan. 1979
George B. Geyer, Lawrence M. Nen, and Charles H. Urban Mar. 1980 100 p refs Sponsored in part by Air Force
(AD-A082936; FAA-NA-79-43; ESL-TR-79-40) Avail: NTIS HC A05/MF A01 CSCL 13/12

The feasibility of replacing a potentially lethal aircraft cabin environment with a cool habitable atmosphere which is nonsupportive of combustion during passenger evacuation in fire emergencies was investigated. Carbon tetrafluoride (CF4) was chosen as the fire extinguishant because of its very low toxicity and high molecular stability under thermal insult. Four large-scale experiments were performed in a completely instrumented cabin of a DC7 aircraft employing both Class A and B combustable materials. Three experiments were performed using the habitable inert atmosphere (27 volume percent CF4) discharging at the rate of 3,300 cubic feet per minute into the aircraft cabin through a window exit. For comparative purposes, the fourth experiment was performed using neat CF4 discharged from two simulated points of fuselage penetration by a ballistically-powered aircraft slug penetrator nozzle. The CF4-air atmosphere was capable of extinguishing nonsurvivable Class A and B cabin fires within 125 seconds or less during which time the cabin temperature was rapidly reduced and visual acuity slowly improved by smoke dilution during the Class A fire tests. Fire extinguishment by means of neat CF4 at the same discharge rate required approximately twice as long, and visibility within the cabin did not improve during the duration of the experiment. DEVELOPMENT AND TESTING OF AN AUTOMATIC LAP BELT RETRACTION AND RELEASE SYSTEM Interim Report
Marcus Schwartz 25 Jan. 1980 41 p refs
(WF4140000)
(AD-A080950; NADC-79270-60) Avail: NTIS HC A03/MF A01 CSCL 01/3

The consequences of a poor or loosely adjusted restraint system have been well documented and have been shown to cause various crewmember injuries and also to degrade ejection seat performance. An automatic lap belt retraction and seat-man release system has been developed for use with the Navy's Maximum Performance Escape System ejection seat. The lap belt cinch-up device works simultaneously with the action of the inertia reel from independent gas generators, while the lap belt release device work simultaneously with the strap cutter from a common gas generator. In-house testing of improved cinch and release prototype devices is continuing. GRA

US ARMY SURVEY OF AIRCREW SURVIVAL KITS/VESTS Final Report
Thomas H. Judge Jan. 1980 101 p
(AD-A081153; CE/MEL-210; NATICK/TR-80/012) Avail: NTIS HC A06/MF A01 CSCL 06/7

For a number of years air crew members have complained of problems with survival kits, vests, and components. These complaints have been debated time and again with no resolution forthcoming to meet the comprehensive crash survival needs of the aircrew members. In an effort to resolve these complaints, a survey was initiated throughout the U.S. Army Aviation Community to identify the problem areas and develop rationale for correction action. This report discusses results of the survey and conferences held following completion of the survey. Medical, Crash, Search and Rescue and Aviation Community Data provided rationale for new approaches to survival kits and vests. These approaches to reduce the amount of present day survival components were modified by each conference and upgraded to improve the aircraft crash survival environment. The reductions in helicopter crash fires and the ability of rescue teams to recover crash survivors in six hours or less has contributed to the need to replace present day nonessential items with only essential, absolute need, survival components. LATERAL ROLLOVER PROTECTION CONCEPTS Final Report, Oct. 1977 - Aug. 1979
Roy G. Fox Jan. 1980 107 p refs
(Contract DAAJ02-77-C-0078; DA Proj. 1L2-62209-AH-76)
(AD-A081420; USAAVRADCOM-TR-80-D-1) Avail: NTIS HC A06/MF A01 CSCL 01/3

Helicopter accidents in which the aircraft rolled over laterally are costly in aircraft damage. U.S. Army helicopter accident reports involving lateral rollover for a 6 1/2 year period were analyzed to determine their significant characteristics such that design concepts for rollover protection could be identified. The results of the accident analysis were applied to portions of crash survival specifications and design concepts for rollover protection. Dynamic rollover, when the aircraft is light on its landing gear, was investigated using computer simulation to identify pertinent parameters. A quick response from the pilot to reduce main rotor thrust is the primary means available for recovery. A preliminary evaluation of the KRASH computer simulation program was done for the rollover environment. Design concepts that either prevented the occurrence of a rollover accident or minimized the dangers to the occupants as the aircraft rolled over were investigated. An automatic rollover sensing and correction system was investigated. Wing and wide landing gear concepts can provide increased rollover resistance. Means of preventing hazardous main rotor pylon motion during a rollover accident were also investigated. GRA

DEVELOPMENT OF COMPUTER-GENERATED PHENOGRAMS TO FORECAST REGIONAL CONDITIONS HAZARDOUS TO LOW-FLYING AIRCRAFT Final Report, 30 Sep. 1977 - 30 Dec. 1979
William E. Southern Dec. 1979 102 p refs
(Grant AF-AFOSR-3431-77; AF Proj. 2312)
(AD-A081869; AFOSR-80-0175TR) Avail: NTIS HC A06/MF A01 CSCL 01/2

Collisions or strikes between birds and aircraft that occur annually across the United States result in damages amounting to millions of dollars and considerable risk to crew members. Gulls are involved in more strikes than any other group of avian species. USAF aircraft are vulnerable to birdstrikes during take-off, while landing, and during low-altitude missions. This report describes monthly patterns of gull distribution across the United States and provides a statistical model for predicting the probability of one or more birdstrikes occurring. The accuracy of such predictions is dependent upon the input data for the model being as complete as possible. In addition, the data should be for the specific geographical area for which the prediction is desired. The following types of data are needed: (1) an estimate of the number of birds present in the area; (2) the number of missions flown in the area; and (3) the number of strikes previously recorded in the area. With this information at hand, it is possible to determine how a change either in the number of missions flown or in the concentration of birds present will affect the probability of a birdstrike occurring. GRA

AN INVESTIGATION OF FACTORS AFFECTING AIRCRAFT PASSENGER ATTENTION TO SAFETY INFORMATION PRESENTATIONS Final Report, Nov. 1978 - Apr. 1979
Daniel A. Johnson Aug. 1979 32 p refs
(Contract DOT-FA78WA-4095)
(AD-A082358; IRC-79-1) Avail: NTIS HC A03/MF A01 CSCL 01/2

Many commercial aircraft passengers do not appear to attend to the safety information presentation given prior to takeoff. This presentation, in the form of the oral briefing given by the flight attendant and the safety information cards, supplies information the passenger may need to increase the probability of safely surviving an aircraft emergency. A questionnaire was administered to 255 respondents who had flown at least twice in the previous two years. A number of factors associated with the way the information is presented, the apparent response of other passengers to the presentation, perceived accident probability, relative adequacy of the oral briefing, and situational and demographic variables are related to whether the passenger reports attending or not attending to the safety presentation. ENGINEERING AND DEVELOPMENT PROGRAM PLAN: EN ROUTE CONTROL, PROGRAM 12
Nov. 1979 57 p
(AD-A082471; FAA-ED-12-2B) Avail: NTIS HC A04/MF A01 CSCL 17/7

Implementation of the third generation en route air traffic control system, model A3d2, provides basic automation capability for processing flight data and surveillance functions. Substantial upgrading of this basic capability is needed to meet the demand forecast for the en route system through the 1980's. The development plan to build the features and functions necessary for upgrading the present third generation en route system is described. Program objectives, development activities, implementation considerations, and resource estimates are set forth. R.E.S.

PRELIMINARY COMPUTER SIZING ESTIMATES FOR AUTOMATED EN ROUTE ATC (AERA)
H. Gilbert Miller Oct. 1979 38 p
(Contract DOT-FA80WA-4370)
(AD-A082628; MTR-79W00263; FAA-EM-79-21) Avail: NTIS HC A03/MF A01 CSCL 17/7

An analysis that estimates the computer sizing requirements imposed by the Automated En Route Air Traffic Control (AERA) system, a possible long-term enhancement to National Aviation System, is presented. In order to establish preliminary AERA processor and memory requirements, two models are presented. A simulation model of the higher level AERA functions, such as initial processing and progress monitoring, is applied to the Washington Center to show typical AERA imposed processor loading. A previously developed linear model of required memory is also applied to show typical memory requirements resulting from AERA. The models presented reflect a version of AERA did not include the recently developed concepts of strategic and tactical planning/control. Additionally, since AERA will continue to evolve during the development stage, requirements enumerated

must be considered preliminary in nature and significant changes on the estimates may be expected. R.E.S.

RADAR APPROACH CONTROL (RAPCON) PRIMARY INPUT POWER SUPPLY STUDY
Robert L. Boyce 15 Aug. 1979 25 p
(AD-A074080; Rept-1842EEG/EEISG-TR-79-15) Avail: NTIS HC A02/MF A01 CSCL 17/7

Equipment failure data was collected from 52 representative sites (with and without voltage regulators) for a period of 12 months to determine whether or not equipment failures were less while using voltage regulators on RAPCON ac power supplies. No correlation could be found between reduced failures and the use of voltage regulators. The equipment failure rates at sites with regulated power supplies, compared to those sites with unregulated power supplies were approximately the same, except that indicator scopes located at sites with unregulated power supply systems had a lower failure rate. It was also found that seven of the ten highest failure incidence sites had regulated input power. Failure rates were found to be at, or below, the specified MTBF of the equipment. Recommendations are included. A.R.H.

WIND-SHEAR ENCOUNTERS DURING VISUAL APPROACHES AT NIGHT. A PILOTED SIMULATOR STUDY
P. L. Bisgood, J. W. Britton, and H. Y. Ratcliffe (Cranfield Inst. of Tech.) London HMSO Sep. 1979 64 p refs
(RAE-TR-79126; RAE-FS-112; BR71911) Avail: NTIS HC A04/MF A01

A study was made in a fixed-base simulator of encounters with a variety of idealized wind shears under conditions simulating a two-pilot approach, partly on instruments and partly visual, made at night were studied in a fixed-bed simulator. Twenty-five pilots, airline and service, participated completing a total of 62 sorties, each of ten approaches. There were four shear encounters per sortie. The data comprized time-histories of each approach together with the pilots responses to a datailed questionnaire and their spontaneous observation. Results show that pilots are successful in recognizing the absence of shear or the presence of severe shear. They are less successful in recognizing shears of moderate intensity or in identifying the velocity components. To cope effectively with the shears, pilot action must be both prompt and appropriate and it is clear that pilots were quick to seek clues that might offer 'early warning' of impending shear. It seems likely that the inclusion of shear encounters during routine simulator training can prove beneficial. Author (ESA)

PRECISION NAVIGATION FOR AIR TRAFFIC MANAGEMENT
S. Ratcliffe London HMSO Oct. 1978 9 p refs Presented at 29th AGARD/GCP Symp., Copenhagen, Oct. 1979
(RSRE-Memo-3220; BR72506) Avail: NTIS HC A02/MF A01

The problems that would arise if airspace users had the use of NAVSTAR, or some other position-fixing aid, and the uses that Air Traffic Control (ATC) could, or could not, make of this capability are discussed. There would be formidable transitional problems in the vertical plane, because NAVSTAR measures height from the Earth's center whereas current altimeters measure atmospheric pressure. In either vertical or horizontal planes much work is necessary to prove that the separation standards can be reduced at all. Changes that might be possible in the ATC system should appreciable reductions in separation standards prove possible are suggested. A collision avoidance system based on either the broadcast coordinates of each aircraft, or on a time-frequency basis using NAVSTAR as the time reference is proposed. The latter scheme would offer protection to a fully-equipped aircraft against another that could not afford the expense of a NAVSTAR fit. Author (ESA)

COMPARISON OF THEORETICALLY PREDICTED LATERAL-DIRECTIONAL AERODYNAMIC CHARACTERISTICS WITH FULL-SCALE WIND TUNNEL DATA ON THE ATLIT AIRPLANE
Michael Griswold and J. Roskam May 1980 213 p refs (Grant NsG-1574)
(NASA-CR-163189; KU-FRL-399-2) Avail: NTIS HC A10/MF A01 CSCL 01C

An analytical method is presented for predicting lateral-directional aerodynamic characteristics of light twin engine propeller-driven airplanes. This method is applied to the Advanced Technology Light Twin Engine airplane. The calculated characteristics are correlated against full-scale wind tunnel data. The method predicts the sideslip derivatives fairly well, although angle of attack variations are not well predicted. Spoiler performance was predicted somewhat high but was still reasonable. The rudder derivatives were not well predicted, in particular the effect of angle of attack. The predicted dynamic derivatives could not be correlated due to lack of experimental data. R.E.S.

MEASUREMENT OF AIRCRAFT SPEED AND ALTITUDE
William Gracey May 1980 311 p refs
(NASA-RP-1046; L-12610) Avail: NTIS HC A14/MF A01 CSCL 01C

Problems involved in measuring speed and altitude with pressure-actuated instruments (altimeter, airspeed indicator, true-airspeed indicator, Machmeter, and vertical-speed indicator) are examined. Equations relating total pressure and static pressure to the five flight quantities are presented, and criteria for the design of total and static pressure tubes are given. Calibrations of typical static pressure installations (fuselage nose, wing tip, vertical fin, and fuselage vent) are presented, various methods for flight calibration of these installations are described, and the calibration of a particular installation by two of the methods is described in detail. Equations are given for estimating the effects of pressure lag and leaks. Test procedures for the laboratory calibration of the five instruments are described, and accuracies of mechanical and electrical instruments are presented. Operational use of the altimeter for terrain clearance and vertical separation of aircraft is discussed, along with flight technical errors and overall altitude errors of aircraft in cruise operations. Altitude-measuring techniques based on a variety of properties of the Earth and the atmosphere are included. Two appendixes present airspeed and altitude tables and sample calculations for determining the various flight parameters from measured total and static pressures. R.E.S.

ICING NOZZLE ELEMENT OPTIMIZATION TEST, JANUARY 1979 Final Report
Leandro V. Delgado 20 Aug. 1979 370 p refs
(AD-A081175; AFGL-TR-79-0193) Avail: NTIS HC A12/MF A01 CSCL 14/2

An MC-130E instrumented by AFGL for cloud physics research flew a series of tests behind a KC-135 specially modified with a multi-element spray nozzle. The tests, for Air Force Flight Test Center, were to sample and define the spray plume produced by the nozzle at specified values of water flow rate, distance from nozzle, and temperature. PMS spectrometers were used to sample the artificial cloud. Data were analyzed to produce sample average and instantaneous 1 sec particle size spectra with liquid water content values. Comparison of values of liquid water content, water flow rate, and distance from nozzle to instrument indicate well defined linear relationships. Instantaneous 1 sec liquid water content values indicate a variance in the uniformity across the spray. Maximum, minimum, mean, and standard deviation values are provided for each sample to charactarize the variance. Although many of the particles had round shapes, it was not possible to tell from the instrumentation whether the particles were ice or water drops. GRA

MM&T FIBER REINFORCED PLASTIC HELICOPTER TAIL ROTOR ASSEMBLY (PULTRUDED SPAR) Final Report, 29 Aug. 1975 - 30 Oct. 1978
Maron J. Bonassar and John J. Lucas Jan. 1980 181 p ref
(Contract DAAJ02-76-C-0001)
(AD-A082352; SER-70286; USAAVRADCOM-TR-79-45) Avail: NTIS HC A09/MF A01 CSCL 01/3

This program was directed at establishing the pultrusion process for the manufacture of helicopter tail rotor spars as a means of lowering manufacturing cost without sacrificing structural performance and keeping design changes to a minimum. The pultrusion process capability was successfully demonstrated by designing, fabricating, and testing a full-size tail rotor spar assembly for the YUH-60A prototype helicopters. Although the pultrusion process was determined to be a viable manufacturing fabrication method, the program was terminated prior to completion because the cost effectiveness and producibility of the pultrusion process as compared with present UH-60A BLACK HAWK production techniques are not sufficiently significant to warrant a change in manufacturing fabrication method at this time. GRA

PRIMARY ADHESIVELY BONDED STRUCTURE TECHNOLOGY (PABST). DESIGN HANDBOOK FOR ADHESIVE BONDING Final Report, 15 Mar. 1977 - Jan. 1979
D. L. Potter Wright-Patterson AFB, Ohio AFFDL Nov. 1979 192 p refs
(Contract F33615-75-C-3016; AF Proj. 486U)
(AD-A082078; MDC-J6076; AFFDL-TR-79-3129) Avail: NTIS HC A09/MF A01 CSCL 11/1

The Air Force Primary Adhesively Bonded Structure Technology (PABST) Program was started in February 1975 for the purpose of validating the concept of adhesive bonding primary fuselage structural members together in lieu of the use of rivets. The goal of the program was to provide a cost saving of 20 percent of the acquisition and maintenance cost of ownership. It was further desired to show a 15 percent weight saving for the bonded assemblies. The program is now complete and the damage tolerance and durability of bonded structure has been shown to exceed, by far, that of riveted structure. Also the cost and weight savings goals appear to be obtainable for a production article. The design guidelines for a bonded primary structure are presented. The complete design criteria are identified for successfully developing bonded primary structure. It includes the fatigue, damage tolerance, and fail-safe criteria for both the metallic structure and adhesive bond area. A section discusses the material selection requirements, and another one presents the manufacturing considerations required to properly bond the primary structure. A review of the inspection needs is presented followed by a discussion of the repairability of the bonded structure. The cost and weight analysis reviews the methods used to determine results obtained on the program. A complete section covers the loads, load transfer, and failure modes of bonded joints and this is followed by an analysis section which describes numerical methods for analyzing all manner of bonded joints with and without adjacent metal flaws. The final section in the report discusses the types of tests and associated specimens needed to properly select an adhesive for use in a bonded primary structure. GRA

A CASE FOR VATOL FLIGHT DEMONSTRATION
C. Joseph Martin Jan. 1980 33 p refs Presented at the V/STOL Aircraft Aerodyn. Meeting, Monterey, Calif, 16-18 May 1979
(ZF66421001)
(AD-A082179; DTNSRDC/AERO-1264; DTNSRDC-80/018) Avail: NTIS HC A03/MF A01 CSCL 01/3

This paper reviews the work on the Vertical Attitude Takeoff and Landing (VATOL) technology development. Studies of vertical and short takeoff and landing aircraft have shown a significant advantage in payload or performance for the vertical attitude concept. The additional payoff from the incorporation of Post-Stall Combat Maneuvering is identified. The VATOL post-stall control system that requires control at high angle-of-attack, provides a decisive combat advantage over a conventional fighter. The planning for post-stall aerodynamic studies at DTNSRDC and NASA Ames is presented. This includes a large powered model to be tested in the NASA 40 x 80 foot wind tunnel. Progress toward a moving base simulation of the vertical attitude landing is reviewed. Results of design studies indicating the feasibility of a VATOL research aircraft, using an existing propulsion system are outlined along with a possible configuration for an advanced VATOL fighter that incorporates a novel control system. FUTURE V/STOL AIRPLANES: GUIDELINES AND TECHNIQUES FOR ACQUISITION PROGRAM ANALYSIS AND EVALUATION, EXECUTIVE SUMMARY
J. R. Nelson, J. R. Gebman, J. L. Birkler, R. W. Hess, P. Konoske-Dey, and W. H. Krase Feb. 1980 44 p refs
(Contract MDA903-77-C-0107)
(AD-A081922; RAND/R-2397-PA/E; ISBN-0-8330-0166-3; LC-79-22274) Avail: NTIS HC A03/MF A01 CSCL 01/3

The purpose of this summary report and a companion technical document (AD-B044 537) is to assist the Department of Defense in making critical evaluations of proposed vertical/short takeoff and landing (V/STOL) airplane program characteristics, including

airplane performance, acquisition schedule, and acquisition cost. The guidelines and techniques described in these two documents take the form of analytical tools, data, and lessons drawn from previous V/STOL airplane research, development and acquisition experience. The documents focus exclusively on the acquisition phase for the airframe and the propulsion subsystems; avionics is not considered. The operational utility of V/STOL airplanes and the possible new missions to which V/STOL airplanes might be uniquely suited are not addressed. GRA

ADVANCED COMPOSITE ROTOR HUB PRELIMINARY DESIGN Final Report, Oct. 1977 - Jul. 1979
Elliot F. Olster Jan. 1980 193 p refs
(Contract DAAJ02-77-C-0056; DA Proj. 1L2-62209-AH-76)
(AD-A081951; USARTL-TR-78-53) Avail: NTIS
HC A09/MF A01 CSCL 01/3

The design requirements for a UH-60A (BLACK HAWK) main rotor hub are presented. A series of six composite hub configurations were evaluated. The evaluation included a comparison to the design requirements as well as additional goals such as reduced weight, cost, radar cross section, use of existing rotor head components, etc. The best of these hub concepts was subsequently refined and reanalyzed. The results of this study indicated the following: (1) A composite rotor hub can reduce the weight of an equivalent metal hub by up to 15%, (2) The production and acquisition costs of a composite hub are 20% less than its metal counterpart, (3) The life-cycle cost analysis indicated that $690K could be saved if the hub were in production by January 1983. The life-cycle cost savings are significantly affected by the 'introduction time', and a 6-month delay would negate the cost savings, and (4) For other benefits, such as an alternate source in case of a shortage of titanium, or to generate limited, in-service, maintenance and repair data on a composite hub, a continued effort was recommended. GRA

HC A10/MF A01 CSCL 01/3

Six different rack concepts were investigated for determining the most optimum configuration of packaging the avionic equipment on A and B type V/STOL aircraft. The two basic approaches of cooling the rack considered were air impingement and conduction cooled. As a baseline, two module configurations were used; an Improved Standard Electronic Module-2A, and Hollow Core Design with an ISEM-2A form factor. The modules, utilizing chip carrier semiconductor devices, were assumed to dissipate 5 to 10 watts. The rack power system makes use of Solid State Electric Logic (SOSTEL) power management elements. A parametric thermal analysis with junction temperatures from 60 to 125 C was performed. Each of the following disciplines, Mechanical, EMI, ECS, Reliability, Maintainability and Life Cycle Costs were also considered in the design of the racks. A Sensitivity Evaluation Program was used to select the most viable approaches. GRA

(AD-A081860; USAAEFA-78-18) Avail: NTIS
HC A04/MF A01 CSCL 01/3

The United States Army Aviation Engineering Flight Activity, in conjunction with the Boeing Vertol Company, conducted an evaluation of the CH-47C helicopter with fiberglass rotor blades and a prototype blade de-ice system. The rotor blades were tested under natural and artificial icing conditions at St. Paul, Minnesota from 24 January to 2 March 1979, and required 30.1 flight hours of which 17.7 hours were in an icing environment. Testing was conducted in two phases: (1) protected, where the blade de-ice system was allowed to operate automatically and (2) unprotected, where the blade de-ice system was held in standby status. The fiberglass rotor blade system was evaluated at conditions varying from 0.1 gm cu m liquid water content (LWC) to 0.8 gm cu m LWC and temperatures varying from -4 C to -16 C. Time in the icing environment varied from a minimum of 28 minutes to a maximum of 2 hours and 25 minutes. The protected rotor blade de-ice system operated satisfactorily. The unprotected rotor blades operated satisfactorily under the limited conditions tested. Minimal ice accretion and minimal asymmetric shed characteristics were observed. Two deficiencies for flight under icing conditions unrelated to the fiberglass rotor blades were noted. The deficiencies are: (1) failure of the droopstops to engage after flight in icing conditions; and (2) ice accretion and subsequent blockage of the fuel vents. GRA

HC A07/ MF A01 CSCL 20/4

A real-time airframe simulation was constructed with an all analog, hybrid-single Central Processing Unit (CPU), hybrid-dual CPUs with shared common memory, hybrid-dual CPUs with an Input/Output serial link, and all digital computer configurations so as to investigate the effects of various computer error sources on solution accuracy. The airframe simulation represented three degrees-of-freedom of longitudinal motion such that effects of error sources on both short period and phugoid motion could be observed. The error analysis utilized Fast Fourier Transforms which showed how the Power Spectra of the transient airframe response distorted (relative to a theoretical response) when contaminated with error sources. THE RAPID PREDICTION OF AIRCRAFT STORE LOADING DISTRIBUTION AT TRANSONIC SPEEDS, PART 2 Final Report, 1 Jan. 1975 - 30 Sep. 1979
Anthony J. Crisalli, Stephen S. Stahara, and Michael J. Hemsch Oct. 1979 82 p refs
(Contract F44620-75-C-0047; AF Proj. 2307)
(AD-A082005; NEAR-TR-204-Pt-2; AFOSR-79-1282TR-Pt-2)
Avail: NTIS HC A05/MF A01 CSCL 20/4

An account is provided for the progress made in the development of an engineering predictive method for determining loading distributions on external stores located in the three dimensional transonic flow field of a parent aircraft. Attention has been directed toward developing accurate but rapid methods for predicting store loadings in transonic flow fields generated by wing-body/pylon combinations representative of modern fighter-bomber aircraft. Detailed evaluations, based on extensive comparisons with experimental data obtained from a parallel wind-tunnel test phase of the program, are presented for two store loading prediction methods. Results are provided for various wing-body/pylon/store configurations for flow conditions throughout the transonic regime. GRA

DESIGN OPTIONS STUDY Final Report
E. A. Barber, D. G. Blattner, R. J. Marhefka, M. Fligstein, and E. J. LaKous 29 Feb. 1980 161 p refs
(Contract F33615-78-C-0114)
(AD-A082941; D180-24258-3) Avail: NTIS HC A08/MF A01 CSCL 01/3

This study considered a number of desired military features applied to a new commercial freighter and examined the commercial operating cost penalties and military life cycle costs. An I.O.C. of 1990 is projected for the new commercial freighter aircraft and the military design options, based upon a 1985 technology maturity date for the key technologies. The baseline aircraft incorporates graphite epoxy primary structure, active flight controls, advanced engines and aircraft systems. It appears that use of the dedicated commercial freighter uncompromised, but with selective military loading preprogrammed to optimize unit payloads, can provide a major portion of the airlift with only a minor increase in the organic fleet. One of the most pervasive influences in the study was the cost of the Enhanced CRAF provisions on the Design Options airplanes. Commercial pricing was used for both the baseline airplane and the provisions. However, because the CRAF provisions were developed and procured on a small unit buy relative to the baseline airplane the relative cost of the CRAF provisions are high, and significantly influence the results. MEASUREMENT OF MOMENTS OF INERTIA AND PRINCIPAL INERTIA AXIS OF A GNAT AIRCRAFT Final Report
R. L. Poulter London HMSO Jul. 1979 27 p refs
(RAE-TR-79090; RAE-FS-106; BR70939) Avail: NTIS HC A03/MF A01

The modifications made to a ground rig used to measure moments of inertia and the technique developed to minimize errors in the moment of inertia in roll are described. Calibration of the rig shows that acceptable accuracies are obtained while results for the moments of inertia in roll and pitch as well as the inclination of the principal inertia axis of the Gnat aircraft are given. Three fuel states, empty, external tanks full, and internal tanks full, were tested, comparisons being made with estimated values where possible. Author (ESA)

A DYNAMIC EVALUATION OF THE INTEGRATED AVIONICS CONTROL SYSTEM (IACS) Final Report
William B. DeBellis Feb. 1980 54 p
(AD-A082203; HEL-TM-2-80) Avail: NTIS HC A04/MF A01 CSCL 01/4

The Integrated Avionics Control System (IACS) was developed to reduce crew member workload and save cockpit space by controlling all airborne communication systems from a single control panel. This investigation compares the IACS with a suite of standard communication radios through the use of computer graphics, mockups, and hardware. It was concluded (1) that there is a definite savings in cockpit space, (2) the crew workload is reduced, and (3) cockpit 'bookkeeping' related to communications is a significant portion of the workload. (Contract F33657-79-C-0717; AF Proj. 2257)
(AD-A082166; Rept-1753-01-1-2124) Avail: NTIS HC A10/MF A01 CSCL 01/3

This is the final report on a study concerning the development of an avionics packaging, mounting, and environmental (PME) standard and an associated cost-benefit analysis. The report compares military and commercial airlines avionics generic standards to determine their technical and procedural differences and identifies the changes and waivers required when equipment built to the commercial airlines standards are procured by the USAF. It also compares the functional and physical characteristics of certain military and commercial avionics equipments and assesses the degree of utility of current commercial equipments for use in USAF aircraft. The opinions of aircraft and avionics manufacturers concerning a military avionics PME standard and their suggestions as to what the standard's scope an applicability should be, are reponed. Alternative avionics cooling procedures and technologies and the concept of employing a separate environmental control system dedicated to avionics cooling are reviewed. A life-cycle cost payback model that addresses the impact of PME standardization on the cost of avionics systems in USAF aircraft is described. The results of exercising the model are reported. The significant tasks and scheduling for the next phases of avionics PME development, leading to the definition and acceptance of a military avionics PME standard, are presented. GRA

HELICOPTER REMOTE WIND SENSOR FLIGHT TEST
David H. Dickson and Jon E. Ottesen Feb. 1980 54 p refs
(DA Proj. 1L1-62111-AH-71)
(AD-A082770; ERADCOM/ASL-TR-0051) Avail: NTIS HC A04/MF A01 CSCL 14/2

A flight test program has been completed in which the Helicopter Remote Wind Sensor was mounted on a UH-1 testbed aircraft. Wind measurements were made and recorded under a variety of flight hover conditions. Data from the flight test program are presented as wind profiles as a function of range, and data reduction and analysis approaches are discussed. The point-pair method was applied for comparison to theoretical and wind tunnel results. The data are applied to a baseline ballistics study sufficient to estimate the quantity of data needed for free-flight aerial armaments. GRA

COMPARISON OF SEVERAL INFLOW CONTROL DEVICES FOR FLIGHT SIMULATION OF FAN TONE NOISE USING A JT15D-1 ENGINE
J. G. McArdle, W. L. Jones, L. J. Heidelberg, and L. Homyak

1980 45 p refs Presented at the 6th Aeroacoustics Conf., Hartford, 4-6 Jun. 1980; sponsored by AIAA
(NASA-TM-81505; E-443) Avail: NTIS HC A02/MF A01 CSCL 21E

To enable accurate simulation of in-flight fan tone noise during ground static tests, four devices intended to reduce inflow disturbances and turbulence were tested with a JT15D-1 turbofan engine. These inflow control devices (ICD's) consisted of honeycomb/screen structures mounted over the engine inlet. The ICD's ranged from 1.6 to 4 fan diameters in size, and differed in shape and fabrication method. All the ICD's significantly reduced the BPF tone in the far-field directivity patterns, but the smallest ICD's apparently introduced propagating modes which could be recognized by additional lobes in the speeds; at supersonic fan tip speed the smallest ICD's had some measurable loss, but the largest had no loss. Data from a typical transducer show that the unsteady inflow distortion modes (turbulence) were eliminated or significantly reduced when either of the ICD's was installed. However, some steady inflow distortion modes remained. A.R.H.

QCSEE UTW ENGINE POWERED-LIFT ACOUSTIC PERFORMANCE
I. J. Loeffler, N. E. Samanich, and H. E. Bloomer 1980 35 p refs Presented at the 6th Aeroacoustics Conf., Hartford, 4-6 Jun. 1980; sponsored by the AIAA
(NASA-TM-81504; E-442) Avail: NTIS HC A03/MF A01 CSCL 21E

Powered-lift acoustic test of the Quiet Clean Short Haul Experimental Engine (QCSEE) under the wing (UTW) engine are reported. Propulsion systems for two powered-lift concepts were designed, fabricated, and tested. In addition to low noise features, the designs included composite structures, gear-driven fans, digital control, and a variable pitch fan (UTW). The UTW engine was tested in a static ground test facility with wing and flap segments to simulate installation on a short haul transport aircraft of the future. Powered-lift acoustic performance of the UTW engine is compared with that of the previously tested and reported QCSEE over-the-wing (OTW) engine. Both engines were slightly above the noise goal but were significantly below current FAA and modern wide-body jet transport levels. The UTW system in the powered-lift mode was penalized by reflected engine noise from the wing and flap system, while the OTW system was benefitted by a wing noise shielding effect. J.M.S.

(Grant NsG-3233)
(NASA-CR-163190) Avail: NTIS HC A08/MF A01 CSCL 21E

A method for measuring in-plane displacement of a rotating structure by using two laser speckle photographs is described. From the displacement measurements one can calculate strains and stresses due to a centrifugal load. This technique involves making separate speckle photographs of a test model. One photograph is made with the model loaded (model is rotating); the second photograph is made with no load on the model (model is stationary). A sandwich is constructed from the two speckle photographs and data are recovered in a manner similar to that used with conventional speckle photography. The basic theory, experimental procedures of this method, and data analysis of a simple rotating specimen are described. In addition the measurement of in-plane surface displacement components of a deformed solid, and the application of the coupled laser speckle interferometry and boundary-integral solution technique to two dimensional elasticity problems are addressed. AN APPROACH TO THE LIFE-CYCLE ANALYSIS OF AIRCRAFT TURBINE ENGINES Interim Report
J. R. Nelson Dec. 1979 62 p refs
(AD-A080930; RAND/N-1337-AF) Avail: NTIS HC A04/MF A01 CSCL 21/5

A paper prepared for the AGARD/NATO Lecture Series, 'The Application of Design to Cost and Life-Cycle Cost to Aircraft Engines,' is scheduled for May 1980. A methodology is described for life-cycle analysis of aircraft turbine engines from historical data. The methodology enables the weapon-system planner to acquire early visibility of cost magnitudes, proportions, and trends associated with a new military engine's life cycle, and to identify 'drivers' that increase cost and can lower capability. The methodology is applied at the engine subsystem and aircraft system levels for a military fighter aircraft to demonstrate that decisions about engine performance/schedule/cost must be made at the system level. Commercial considerations are discussed, as is limited historical experience in engine monitoring, an approach to obtaining the necessary information and procedures for performance and cost feedback to the engine designer. This note presents portions of previously published Rand work on life-cycle analysis of aircraft turbine engines and engine monitoring systems, together with some recent unpublished work applying the earlier efforts at the aircraft system level. SHOCK WAVE THERMOMECHANICAL PROCESSING OF AIRCRAFT GAS TURBINE DISK ALLOYS Final Technical Report, Jul. 1978 - Jul. 1979
John M. Robertson, James W. Simon, and Thomas D. Tillman Aug. 1979 54 p refs
(Contract N00019-78-C-0270)
(AD-A082080; FR-11992) Avail: NTIS HC A04/MF A01 CSCL 11/6

This program was conducted to assess the effects of shock wave thermomechanical processing on nickel-base (Ni) gas turbine disks. In particular, the peak pressure limit on shaped subscale turbine disks was determined based on allowable permanent deformation and fracture. Using maximum pressure and selected shock/heat-treat schedules, the effect on mechanical properties was determined with results indicating an enhancement of strength, particularly the yield strength, with only a slight decrease in ductility. In general, low-cycle fatigue (LCF) life was not significantly affected, however, two samples tested showed a 3X improvement in life. In addition, two shock/heat-treat schedules were found to be extremely beneficial and will be investigated further. GRA

(Contract F33615-78-C-2071; AF Proj. 3066)
(AD-A082754; AFAPL-TR-79-2108) Avail: NTIS HC A07/MF A01 CSCL 21/5

The Thermal Response Turbine Shroud program studied and evaluated overall engine active clearance control designs and payoffs for a broad range of engine/aircraft combinations. Both turbine and compressor active clearance control systems were considered for gas turbine engines that encompassed high and low fan bypass ratios, single and two stage turbines, and

commercial and military missions. The study of active clearance control included detailed material, heat transfer and thermal and mechanical growth analyses. The study effort looked at the active control of clearance at transient as well as steady state engine operation. The evaluation included an overall assessment of active clearance control benefits and penalties in both performance and cost for the particular aircraft/engine system studied. GRA

MATERIAL EVALUATION. PART 1: MECHANICAL PROPERTY TESTING AND MATERIALS EVALUATION AND MODELING Final Report, Apr. 1976 - Jun. 1979
Noel E. Ashbaugh Wright-Patterson AFB, Ohio AFML Sep. 1979 91 p refs
(Contract F33615-76-C-5191; AF Proj. 7351)
(AD-A081871; SRL-6909-01; AFML-TR-79-4127-Pt-1) Avail: NTIS HC A05/MF A01 CSCL 21/5

To accomplish the assessment of the characteristics of materials which are currently being used or which may be used in airframes and in gas-turbine engines, the following three tasks were performed--development and implementation of mechanical test methods, research on the application of solid mechanics to failure prediction, and investigation of environmental effects upon mechanical behavior. Some of the test methods which were developed in the first task were a low-cycle-fatigue (LCF) test capability, an experimental set-up to evaluate crack growth under sustained load, and a capability to conduct crack-growth tests under spectrum loads. In these tests the temperature range was normally between 538 C (1000 F) and 760 C (1400 F), and the specimen geometries were uniform gage specimens for the LCF tests, compact-type (CT) specimens for the sustained-load crack-growth tests, and CT and wedge-opening-loaded (WOL) specimens for crack-growth tests under spectrum loads. The tests which were conducted on material behavior provided data for at least 30 reports and journal articles. These tests, in addition to the previously developed tests, included uniaxial tension and compression tests, creep tests, fatigue-life tests, and single and multiple overload and underload tests. The temperature range for these tests was between room temperature and 760 C (1400 F). Equipment and instrumentation which were designed and fabricated for these tests included resistant furnaces, induction coils, dc conditioners, and power controllers. GRA

MAXIMUM LIKELIHOOD METHOD FOR ESTIMATING AIRPLANE STABILITY AND CONTROL PARAMETERS FROM FLIGHT DATA IN FREQUENCY DOMAIN
Vladislav Klein May 1980 60 p refs Prepared in cooperation with Joint Institutes for Advancement of Flight Sciences, Hampton, Va.
(NASA-TP-1637; L-13383) Avail: NTIS HC A04/MF A01 CSCL 01C

A frequency domain maximum likelihood method is developed for the estimation of airplane stability and control parameters from measured data. The model of an airplane is represented by a discrete-type steady state Kalman filter with time variables replaced by their Fourier series expansions. The likelihood function of innovations is formulated, and by its maximization with respect to unknown parameters the estimation algorithm is obtained. This algorithm is then simplified to the output error estimation method with the data in the form of transformed time histories, frequency response curves, or spectral and cross-spectral densities. The development is followed by a discussion on the equivalence of the cost function in the time and frequency domains, and on advantages and disadvantages of the frequency domain approach. The algorithm developed is applied in four examples to the estimation of longitudinal parameters of a general aviation airplane using computer generated and measured data in turbulent and still air. The cost functions in the time and frequency domains are shown to be equivalent; therefore, both approaches are complementary and not contradictory. Despite some computational advantages of parameter estimation in the frequency domain, this approach is limited to linear equations of motion with constant coefficients. Author

FLUTTER ANALYSIS OF AN AIRPLANE WITH MULTIPLE STRUCTURAL NONLINEARITIES IN THE CONTROL SYSTEM
Elmar J. Breitbach Mar. 1980 39 p refs
(NASA-TP-1620; L-13356) Avail: NTIS HC A03/MF A01 CSCL 01C

Experience has shown that the flutter prediction process for airplanes can be greatly affected by strong concentrated nonlinearities which may be localized in the linking elements of the control mechanism, in the pivot joints of variable-sweep-wing systems, and in the connecting points between wing and pylon-mounted external stores. The principle of equivalent linearization offers an efficent possibility for solving the related nonlinear flutter equations in the frequency domain as a complement to the well-known time domain procedures. Taking as an example an airplane with nonlinear control characteristics, it is demonstrated how the equivalent linearization approach can be extended to rather complicated systems with multiple sets of strongly interacting, concentrated nonlinearities. INITIAL DEVELOPMENT FOR A FLUTTER ANALYSIS OF DAMAGED T-38 HORIZONTAL STABILATORS USING NASTRAN M.S. Thesis
John O. Lassiter Mar. 1980 125 p refs
(AD-A082168; AFIT/GAE/AA/80M-2) Avail: NTIS HC A06/MF A01 CSCL 20/4

This thesis demonstrates the development and response of a finite element model of the T-38 horizontal stabilator using NASTRAN. The finite element model is to be used in a flutter analysis of damaged or repaired stabilators. The objective of the flutter analysis is to determine absolute values and degradations of the flutter speed due to different types of damages and repairs. Development of a finite element model with two dimensional quadrilateral and bar elements is described. For verification, a static analysis of the finite element model yielded for the most part qualitatively agreeable values in comparison to an influence coefficient study. For showing the dynamic response of the finite element model, a model analysis using both rigid and flexible root boundary conditions is used. The rigid root analysis shows agreement between the first two modes and the flexible root compares favorably up to three and possibly four modes. With these results, it is decided to use the finite element model in an initial flutter analysis. In the flutter analysis a doublet lattice aerodynamic model is combined with the finite element model for an undamaged stabilator. Poor agreement of the NASTRAN flutter speed with other available data indicates possible camber effects and the need for a verification aerodynamic model using steady and unsteady airloads. A brief description of a method

of simulating repairs and damages of a horizontal stabilator is included. GRA

RESEARCH IN ADVANCED FLIGHT CONTROL DESIGN Final Scientific Report, 1 Jun. 1977 - 31 May 1979
Isaac Horowitz, B. Golurev, T. Kopelman, and S. Britman. Jan. 1980. 125 p. refs.
(Grant AF-AFOSR-3355-77; AF Proj. 2307)
(AD-A082424; AFFDL-TR-79-3120) Avail: NTIS HC A06/MF A01 CSCL 01/3

The flight control problem is one of regulation and control of a nonlinear, highly uncertain multiple input-output system, to achieve desired performance bounds. Feedback control theory has not been able to cope with even its approximate linear time-invariant version, because of its neglect of synthesis techniques in which uncertainty and performance bounds appear quantitatively. However, there have been two recent breakthroughs, giving precise, rigorous, quantitative synthesis techniques for both linear and nonlinear time-varying, single and multiple input-output systems containing plants with large uncertainties. In these techniques, quantitative performance bounds can be assigned in the time and/or frequency domain. For a large problem class, it is guaranteed that the design satisfies the specifications over the entire range of plant uncertainty. One of the breakthroughs was applied to a significantly nonlinear model of the short-period, longitudinal flight control problem. Uncertainty was included in the model by allowing for a large range in velocity and air-density, without any provision for their measurement. The output $c^*(t)$, was to lie within specified bounds in response to a range of step commands. The design was simulated with excellent results. GRA

INFLUENCE OF PITCHING MOMENT CHARACTERISTICS ON DEPARTURE AND UNCOORDINATED ROLL REVERSAL BOUNDARIES FOR FIGHTER CONFIGURATIONS Final Report, May 1978 - Jun. 1979
William Birhle, Jr. Wright-Patterson AFB, Ohio AFFDL. Feb. 1980. 130 p. refs.
(Contract F33615-78-C-3600; AF Proj. 2403)
(AD-A082335; AFFDL-TR-79-3157) Avail: NTIS HC A07/MF A01 CSCL 01/3

A study is reported which generated design charts and developed associated boundaries for identifying departure and uncoordinated roll-reversal flight characteristics as a function of aerodynamic rolling and yawing moment coefficients typical of fighter airplanes for various pitching moment characteristics. This information should be valuable for specification, design and evaluation purposes. The investigation utilized a large angle, six-degree-of-freedom digital computer program to simulate the motions of a fighter performing a severe air combat maneuver. The results showed that the developed uncoordinated roll reversal boundaries may be applied to any fighter configuration and that the developed departure boundaries are applicable to fighter configurations exhibiting static pitch stability. Unaugmented airframes having pitch instability impose more stringent requirements on the rolling and yawing moment coefficients to avoid departure susceptibility. A simple angle-of-attack feedback augmentation system can markedly improve the departure resistance of both stable and unstable airframes given sufficient control authority. GRA

FLIGHT EVALUATION OF NONDIMENSIONAL STATIC LONGITUDINAL STABILITY TEST METHODS Final Report, Nov. 1974 - Feb. 1975
Kenneth R. Ferrell, Barclay H. Boirun, and James E. Jenks, Jr. Jul. 1979. 66 p. refs.
(AD-A082831; USAAEFA-74-87) Avail: NTIS HC A04/MF A01 CSCL 20/4

Stability and control testing of helicopters at this activity has included performing discrete tests at representative mission conditions, as well as extremes of altitude, airspeed, vertical speed, rotor speed, gross weight, and center of gravity location. Special studies and tests concluded that the use of nondimensional parameters commonly used in performance analysis such as the thrust coefficient, advance ratio, and advancing tip Mach number could be used to reduce the number of independent test variables in stability and control testing. These studies also indicated that constant referred rotor speed might be better for isolation of compressibility effects than the conventional constant rotor speed method for obtaining nondimensional test data. This test investigated the relative advantage of obtaining static longitudinal stability and trim control data as a function of the nondimensional parameters using both the constant referred and constant rotor speed methods on a UH-1M helicopter. Within the accuracy of the test instrumentation, the static longitudinal trim control position data were found to be a function of thrust coefficient and advance ratio. The collective fixed static longitudinal stability was primarily a function of advance ratio only. The advancing tip Mach number did not have a significant effect on the longitudinal stability data on this test helicopter. Static longitudinal stability and control trim position can be defined by obtaining data over the full range of the thrust coefficient and advance ratio envelope and then using the nondimensional method to calculate intermediate value. THE DESIGN OF AIRCRAFT AUTOMATIC RIDE-SMOOTHING SYSTEMS USING DIRECT-LIFT CONTROL
D. E. Fry and J. S. Winter. London: HMSO, May 1979. 93 p. refs.
(RAE-TR-79045; RAE-FS-98; BR70063) Avail: NTIS HC A05/MF A01

How a direct-lift motivator can be used to alleviate the response to vertical turbulence of a rigid, combat-type aircraft is shown. Optimal-control and parameter-optimization techniques are used to design both 'open' and 'closed' loop control systems. Alternative criteria other than simply reducing the normal acceleration response are discussed. The effects of system nonlinearities such as position and rate limits are explored. Both discrete and continuous models of turbulence are used in the analysis. Some nonlinear control solutions are discussed.

ON THE USE IN STABILITY ANALYSIS OF THE RELATIONSHIPS BETWEEN THE COEFFICIENTS OF A QUARTIC EQUATION AND THOSE OF QUADRATIC FACTOR
H. H. B. M. Thomas. London: HMSO, Jun. 1979. 63 p. refs.
(RAE-TR-79065; RAE-Aero-3456; BR70237) Avail: NTIS HC A04/MF A01

The stability of the perturbed longitudinal motion of an unaugmented aircraft about a given trimmed flight condition was determined by the well-known stability quartic. It is shown that two basic relationship exist between the coefficients of the quartic and those of a quadratic factor. Results show that examination of the position of the locus traced out by the point defined by the coefficients of the quadratic in relation to the axes and the parabolic boundary (separating real and complex roots) enables the trends in the nature of and the degree of stability of the mode or modes represented by the quadratic factor to be determined. Expressions are given which enable the value of the parameter being varied, and associated with a given point of the locus, to be calculated. The use of this method of analyzing aircraft stability is illustrated by a number of examples.

METRIC HALF-SPAN MODEL SUPPORT SYSTEM. Patent Application
Charlie M. Jackson, Jr., Samuel M. Dollyhigh, and David S. Shaw, inventors (to NASA). Filed 30 Apr. 1980. 11 p.
(NASA-Case-LAR-12441-1; US-Patent-Appl-SN-145210) Avail: NTIS HC A02/MF A01 CSCL 01E

A model support system used to support a model in a wind tunnel test section is described. The model comprises a metric, or measured, half-span supported by a nonmetric, or nonmeasured, half-span which is connected to a sting support. Moments and forces acting on the metric half-span are measured without interference from the support system during a wind tunnel test.

ACCEPTANCE CRITERIA FOR BITUMINOUS SURFACE COURSE ON CIVIL AIRPORT PAVEMENTS. Final Report
J. L. Burati and J. H. Willenbrock. Oct. 1979. 196 p. refs.
(Contract DOT-FA78WA-4185)
(AD-A080430; PTI-7915; FAA-RD-79-89) Avail: NTIS HC A09/MF A01 CSCL 01/5

The development of a statistically based price adjustment acceptance plan for a bituminous surface course is discussed. Data on the physical characteristics of pavement materials were collected from thirteen airport pavement construction projects. A statistical analysis of this data permitted the determination of the parameters (mean and standard deviation) on existing airport construction projects, and these parameters were then used to develop acceptance plans and price adjustment factors. Operating Characteristics (OC) curves and curves of expected payment were used to determine the appropriate acceptance plans, which were based on the percentage of material falling within specification limits (PWL). By using a continuous rather than a discrete price adjustment schedule, it was possible to avoid the problem of large differences in payment associated with relatively small differences in quality (as measured by PWL). A computer program was developed to approximate the expected payment curves associated with different continuous price adjustment systems. This program is applicable to one-sided specification limits such as density. For properties such as air voids, which require both an upper and lower specification limit, the OC curves were determined by computer simulation of 10,000 randomly drawn samples.

INCREASED STANDARDIZATION WOULD REDUCE COSTS OF GROUND SUPPORT EQUIPMENT FOR MILITARY AIRCRAFT
7 Feb. 1980. 65 p.
(PB80-139546; LCD-80-30) Avail: NTIS HC A04/MF A01 CSCL 05A

An analysis of ground support equipment standardization is presented. Substantial savings could be realized if military aircraft ground support equipment could service more than one aircraft. It is suggested that the Department of Defense needs to emphasize standardization of this equipment and improve systems for reducing duplication of equipment. The Department should seek to provide incentives to contractors to use existing aircraft support equipment in the design of new weapon systems.

A COMBINED ENVIRONMENTS RELIABILITY TEST (CERT) FACILITY FOR TESTING OF AIRBORNE EQUIPMENT. Final Report, Jun. 1976 - Oct. 1978
Harriman E. Reynolds. Sep. 1979. 32 p. refs.
(AF Proj. 2402)
(AD-A080974; AFFDL-TR-79-3079) Avail: NTIS HC A03/MF A01 CSCL 01/3

A third combined environment reliability test facility has been developed with improved capability to simulate the dynamic combined environments that internally carried aircraft equipment is exposed to in modern high performance military aircraft. An electro-pneumatic control system individually controls compartment temperature, humidity, air mass flow and altitude, and equipment cooling air temperature, humidity, and mass flow from a tape deck according to aircraft ground and flight profiles programmed on magnetic tape. Random mechanical vibration control is semi-automatic. The design, engineering development, and partial performance capabilities are documented.

PREDICTING THE FATIGUE LIFE OF FLEXIBLE AIRFIELD PAVEMENTS: A RECOMMENDED APPROACH. Final Report, Jul. 1978 - Jun. 1979
Dale S. Decker. Tyndall AFB, Fla.: AFESC, Jul. 1979. 123 p. refs.
(Contract F29601-76-C-0015; AF Proj. 2104)
(AD-A079747; AFESC/ESL-TR-79-26) Avail: NTIS HC A06/MF A01 CSCL 01/5

The pavement engineer currently has no realistic means of predicting the fatigue life of an existing asphalt pavement or the service of a new asphalt pavement surface. The development of information that would enable engineers to make realistic fatigue life predictions, and thereby to make the best use of the increasingly scarce pavement maintenance dollar, is critically needed. This report reviews current fatigue and routine design

best copy available

test methods and examines the effects of materials and environmental conditions on fatigue life. The extensive literature review indicates a possibility that fatigue life may be estimated by correlating known fatigue parameters with results of routine design tests. The repeated-load indirect tensile (fatigue) test and the resilient modulus indirect tensile (routine design) test are recommended for use in U.S. Air Force investigations. GRA

THE FRICTION CLASSIFICATION OF RUNWAYS
R. W. Sugg (Mech. Eng. Res. and Develop.), I. Beaty (Cranfield Inst. of Tech.), and R. J. Nicholls (Cranfield Inst. of Tech.) London HMSO Dec. 1979 43 p. refs
(S/T-Memo-6-79; BR70258) Avail: NTIS HC A03/MF A01

With the development of the continuous recording runway friction meter (Mu-Meter) and a runway self wetting system contained in the tow vehicle, it is possible to obtain a permanent record showing the friction reading along the entire length of a runway. The method developed to carry out such a trial together with its associated Standard Friction Classification Table is described. Use of the Mu-Meter under natural rain conditions demonstrates that aircraft aquaplaning can sometimes occur in local areas. A method for indentifying these areas is explained and how results can be combined with the self wetting trial to give a proper friction evaluation of a runway is hown. The relationship in Mu-Meter readings to the US Federal Aviation Administration and UK Ministry of Defence methods runway friction classification is determined and reported. Author (ESA)

Like the weather, upper atmospheric density often behaves unpredictably. Even the best models of the upper atmosphere cannot consistently predict atmospheric density for Transit System satellites (1000 km) to the desired high precision. A comprehensive evaluation is presented of the drag estimation concept as a tool in routinely determining the orbit of the Transit System, the benefits to the Transit System are also examined. The resulting data (fitted along-track bias force) can be used subsequently to study upper atmospheric density variations at Transit satellite altitudes that will lead ultimately to improved upper atmospheric density models. Drag estimation in satellite orbit determination yields higher precision-tracked (determined) ephemerides and significantly improves the prediction (extrapolated satellite position) accuracy of the Transit System. BIOCENTRIFUGE SYSTEM CAPABLE OF EXCHANGING SPECIMEN CAGES WHILE IN OPERATIONAL MODE Patent Application
Robert R. Below, inventor (to NASA) Filed 30 Apr. 1980 20 p.
(NASA-Case-MFS-23825-1; US-Patent-APPL-SN-145273)
Avail: NTIS HC A02/MF A01 CSCL 06B

A bioresearch centrifuge system for subjecting caged animals to long term centrifugal forces that create gravity conditions aboard orbiting spacecraft is disclosed. The biocentrifuge system is comprised of a centrifuge carrying a plurality of removable and replaceable cages for the animal specimens. Pairs of opposing cages may be removed from the frame while it is rotating, by means of a cage exchanger which rotates concentrically within the centrifuge and the speed of which is controlled independently of the frame speed. An image rotator is provided for selective observation of the rotating animals. The system further includes a waste conveyor system, a food supply system, and a water supply system for each cage for creating a life sustaining environment so that the animals can live in the rotating centrifuge for extended periods. The rotating cage exchanger can also be used to selectively remove containers from various other centrifuges or other rotatable frame structures. NASA

(NASA-CR-161453; LMSC-D715841) Avail: NTIS

HC A14/MF A01 CSCL 22B

Low cost low Earth orbit (LOW) and geosynchronous Earth orbit (GEO) Solar Array concepts in the 300 to 1000 kW range which could be reduced to hardware in the mid 1980's, are identified. Size scaling factors and longer life demands are recognized as the prime drivers for the designs if low life cycle costs for energy are to be achieved. Technology is identified which requires further development in order to assure component readiness and availability. Use of the low concentration ratio (CR) concentrator, which uses gallium arsenide solar cells for both LEO and GEO applications, is recommended. E.D.K.

HC A10/MF A01 CSCL 22B

Planar and concentrator solar array configurations based on silicon and gallium arsenide solar cells were conceptualized and on-orbit maintainability was addressed. Four basic categories emerged: (1) planar (non concentrated) with silicon cells, (2) low-CR (concentration ratio = 3.4) with silicon cells, (3) low-CR with GaAs, and (4) high-CR (concentration ratio = 62.5) with GaAs. A very high-CR (concentration ratio = 200) was investigated but rejected on thermal grounds. Nonrecurring and recurring cost elements for each of the four concepts selected were compared over a 15 year life cycle. Under conditions where the gallium arsenide cells can be produced for less than $25 per 2 x 2 cm, the low CR concentrator emerges as the most cost effective configuration. However, the producibility risk remains higher on the gallium arsenide cell. R.E.S.

VIKING MARS MISSION SUPPORT INVESTIGATIONS IN THE LANGLEY TRANSONIC DYNAMICS TUNNEL

Jerome T. Foughner, Jr. May 1980 23 p. refs.

(NASA-TM-80234; L-13405) Avail: NTIS HC A02/MF A01 CSCL 22A

Six experimental investigations conducted in the transonic dynamics tunnel, which supported elements of the entry and the landed phases of the Viking mission, are described. The objective of each investigation and selected experimental results are presented. How these particular wind tunnel results contributed to spacecraft development and ultimately to the success of the Viking mission is indicated. Experimental studies applicable to the entry phase of the mission included parachute environment and performance definition, aerodynamic characteristics exhibited by two separating bodies, and pressure measurements in the transonic range to optimize the location and orientation of a stagnation-pressure sensor on the Lander. The experimental investigations which supported the landed phase of the mission included a convective heat transfer test to establish the requirements for wind covers for the radioisotope thermoelectric generators and two tests which supported the development and calibration of the meteorological science experiment. HC A05/MF A01 CSCL 17/7

Research on optical pattern recognition (OPR) for missile guidance has addressed three general areas: new OPR techniques, OPR experiments on specific missile guidance problems and scenarios, and component evaluation and testing. In the area of component evaluation and testing, research has been concentrated on 2-D spatial light modulators (SLM) with specific attention to the photo-DKDP, prom, and the liquid crystal light valve and to a general test and evaluation procedure for these devices. A general SLM test and evaluation procedure has been developed. In the area of new OPR techniques, a coherence measure correlator, an equalization correlator, moment invariant hybrid correlator and an averaged filter correlator have been developed. Specific missile guidance scenarios persued were OPR of multi-sensor and infrared imagery. The former has laid initial ground work for a future program in optical statistical and deterministic pattern recognition. The latter has initiated a generalized approach to OPR using hyperspace formulations and linear combinations of orthonormal basis functions. GRA
